History. This island was discovered by Columbus in 1492, and was soon filled with adventurers, who crowded from Europe to the new world in search of sudden wealth. The natives were reduced to slavery by these settlers, who spread themselves over the island, and by their industry the colony increased rapidly in wealth and prosperity. But as it was chiefly by the desire of gold that settlers were attracted to this distant shore, San Domingo was in its turn abandoned for other countries of greater reputed wealth; and the country gradually declined, and, instead of yielding a revenue, became a burden on the mother country. About the middle of the sixteenth century the island of St Christopher was taken possession of by a mixed colony of French and English, who being attacked by the Spaniards, were forced to fly to the barren isle of Tortuga, where they established themselves, and grew formidable, under the well-known appellation of buccaneers. They at last obtained a firm footing in San Domingo, into which they had made only predatory incursions; and by the treaty of Ryswick that part of the island of which they had obtained possession was ceded to the king of France, who acknowledged these adventurous colonists as his subjects. The French colony languished for a while under the galling restrictions imposed on its trade by the mother country; but these being removed about the year 1722, it soon attained a high degree of prosperity, and was in a very flourishing state when the French revolution commenced in 1789. The population was composed of three classes,—whites, people of colour, and blacks. Of these the whites were the favoured class, who engrossed all public honours and emoluments. They considered the people of colour as a degraded caste, with whom it was disgraceful to associate on terms of equality. The black slaves ranked lowest in the scale, and they experienced from both classes all the evils of the most cruel bondage. A society framed of such hostile elements contained in its very constitution the seeds of hatred and contention; and in the course of the revolution which occurred in the mother country these were brought into full activity. The important discussions by which France was at that time agitated kindled a corresponding sensation in the colonies; and the hostile races of the whites and mulattoes were already violently inflamed against each other by the eagerness of their contests, when the national convention, in 1791, passed the memorable decree, giving to the people of colour the unlimited enjoyment of all the rights which were possessed by French citizens; thus at once breaking down all the distinctions which had prevailed in the colony, and which were sanctioned by custom and inveterate prejudice. This decree excited loud and general disapprobation amongst the whites, who immediately adopted the most violent measures. The national cockade, the badge of their attachment to the revolution and to the mother country, was openly trampled under foot, and the authority of the governor-general and the supremacy of the mother country were equally set at nought. The several parishes proceeded to the election of a new assembly, which accordingly met on the 9th of August, under the title of the General Assembly of the French part of San Domingo. The mulattoes in the mean time, alarmed at these proceedings, were collecting in armed bodies for their defence; and the whites were so intent on the meeting of the new colonial assembly that they offered no opposition to these assemblages.

First movements of the negroes. Such was the state of affairs between the two hostile classes of the whites and the mulattoes, when a new and more powerful party, whom all united to oppress, now suddenly combined for their own protection and for the destruction of their enemies. On the 23d of August reports reached the town of the Cape that the negro slaves in the neighbouring parishes were in arms, and that they were destroying the plantations and massacring the inhabitants. This terrible intelligence was confirmed next day in its full extent by crowds of wretched fugitives from the neighbouring country, who, having abandoned their property, were flying to Cape Town from the fury of their savage enemies. The success of this bold and deep-laid conspiracy spread universal consternation amongst the white inhabitants. The citizens in Cape Town were immediately summoned to arms, and the women and children were at the same time sent on board the ships in the harbour. Other measures were also adopted to secure the place against any sudden attack of the infuriated slaves. When these precautions had been adopted, several small detachments of troops were sent out to act offensively against the insurgents; but although partial successes were obtained in these encounters, the general result too fatally demonstrated to the white inhabitants their own weakness and the strength of their enemies. In this destructive war it was calculated that, about two months after its commencement, upwards of 2000 white inhabitants were massacred; that 180 sugar plantations, and about 900 coffee, indigo, and cotton settlements were destroyed, and a thousand families reduced from opulence to misery. Of the insurgents about 10,000 are supposed to have perished in the field, and some hundreds by the hands of the public executioner; and the rebellion, which had been hitherto confined to the northern parts of the island, now began to spread through the western districts, where the blacks were aided by the people of colour, and where, under their united devastations, the country was laid waste for an extent of more than 30 miles. At length they approached the town of Port-au-Prince with the intention of setting it on fire; and it was with great difficulty that a treaty was concluded by which the place was saved from destruction. This treaty was ratified by the colonial assembly, which also announced its intention of granting an extension of privileges to the free people of colour. But in the mean time the national assembly at home, under an impression of the ruinous consequences of their rash concessions to the people of colour, had voted a repeal of the law which gave them the same privileges as the whites; and the intelligence of this repeal reached the colonies at the time when the colonial assembly was holding out the expectation of general equality and freedom. The mulattoes, therefore, when they heard that the national assembly had repealed their former conciliating act in their favour, knew no bounds to their indignation. All thoughts of peace were now abandoned; and the war assumed a diabolical character of cruelty, each studying to outdo the other in acts of revenge. On both sides all prisoners were either massacred without mercy, or reserved for the more solemn barbarity of a public execution.

The national assembly at home, alarmed by the intelligence of these disorders, sent out three civil commissioners, with full powers to settle all disputes. But their authority soon fell into disrepute. Other commissioners were sent, and along with them 8000 troops. Unlike their predecessors, however, they adopted the most arbitrary measures; and about the beginning of the year 1793 they became absolute masters of the colony. But their severity at last provoked resistance to their authority; and having displaced the governor Galbaud, an officer of artillery, and ordered him to France, he, along with his brother, collected about 1200 seamen, with whom they landed, and being joined by other volunteers, attacked the government house, where the commissioners were posted with their force. A fierce and bloody conflict now took place, which terminated without any decisive advantage on either side, and next day the fighting was continued in the streets of the town with various success. In the beginning of these disorders, the commissioners had sought to strengthen their party by the aid of the revolted blacks; and a body of these auxiliaries, amounting to 3000, now entered the place, which immediately became a horrid and revolting scene of conflagration and slaughter. Men, women, and children were massacred by these barbarians without distinction. The white inhabitants, flying to the sea for protection, were met by a body of armed mulattoes, by whom they were put to the sword without mercy; the half of the town was consumed by the flames; and the commissioners, themselves affrighted at these disorders, escaped to the sea-shore, whence, under cover of a ship of the line, they viewed with dismay the wide-spreading mischief.

Ever since the commencement of these unhappy disorders, the white inhabitants had emigrated in great numbers to the neighbouring islands, and to the United States of America; and some of the principal inhabitants having repaired to Britain, induced the British government, by their representations, to prepare an armament with a body of troops to co-operate with such of the inhabitants as were desirous of placing themselves under its protection. At this period the military force of San Domingo consisted of from 14,000 to 15,000 effective troops, and 25,000 free negroes, mulattoes, and slaves. About 100,000 blacks had retired to the mountains to enjoy a savage independence, and in the northern districts 40,000 slaves still continued in arms. It was in these circumstances that the island was taken possession of, in September 1793, by a British force. But though the expedition gained some partial advantages, the climate soon began to make the most dreadful havoc among the troops, and prevented them from achieving any solid success. Toussaint l'Ouverture, who was appointed general-in-chief of the black armies of San Domingo in 1797, proved himself an able and an indefatigable enemy; and at length the British were obliged to evacuate the country in the year 1798. On the 1st of July 1801 the independence of San Domingo was formally proclaimed.

But the war in Europe between Great Britain and France being by this time concluded by the peace of Amiens, Bonaparte, now chief consul of France, sent out an armament, consisting of twenty-six ships of the line, and 25,000 troops, under the command of General Leclerc, his brother-in-law, for the purpose of reducing the revolted colony of San Domingo. To enter into the details of the barbarous and bloody war now begun against the unfortunate inhabitants of San Domingo would not be consistent with our limits, nor would such a narrative be interesting to our readers. It will be sufficient to observe that the numbers and discipline of the force now landed, joined to the skill of its leaders, overpowered all open resistance in the field, so that the blacks, after several obstinate conflicts, and after burning some of the principal towns, were finally compelled to retire into the inaccessible mountains of the interior, whence they carried on, under their undaunted leader, Toussaint, a desultory war against detached parties of their enemies. Elated by this success, Leclerc now threw off the mask, and rashly issued an edict proclaiming the former slavery of the blacks. Toussaint was not slow to profit by this error. Having effected a junction with Christophe, who had still 300 troops under him, and being joined by the cultivators in great numbers, who were no longer deaf to his call, he poured with this collected host like a torrent over the plain; and having everywhere forced the French posts, and driven before him their detached corps, he surrounded the town, to relieve which the French general was compelled to hasten to the spot by forced marches with all the troops he could collect. Here he had recourse to his former arts, and he was but too successful in cajoling the negro chiefs, wearied of war, into a suspension of arms. Having watched his opportunity, he privately seized Toussaint with his family, and embarked him on board of a frigate for France, where, being thrown into prison, he expired in April 1803.

This act of cruel treachery spread universal alarm among the black chiefs; and Dessalines, Christophe, and Clerveaux soon appeared at the head of considerable bodies of black troops. This last contest for the possession of San Domingo was distinguished by a degree of barbarity which surpasses belief. The whites and the blacks seemed to vie with each other in deeds of cruelty and revenge. Retaliation was the plea still used to sanction every enormity, under which an amount of vengeance was at length accumulated on both sides, which nothing short of the utter extermination of one of the parties could thoroughly satisfy. The French, however, it was clear, were now gradually losing ground. About the year 1803 they were confined within their fortifications by the vigorous movements of the black armies; and though reinforcements were received from France, the French general was forced to enter into a capitulation with Dessalines, by which he agreed in 1803 to evacuate the whole island. On the 30th November of that year, the standard of the blacks was hoisted in Cape François; and the French troops, amounting to 8000, surrendered themselves prisoners of war to the British squadron, by which they were closely watched. In 1804 a formal declaration of independence was issued, to which were attached all the names of the generals and chiefs. The ancient aboriginal name of Hayti was revived; while Dessalines, whose military talents were in great esteem, was elected governor-general for life; and in October 1804 he was crowned emperor with great pomp. In this situation he began to display all the cruelties of a tyrant, massacring without mercy the white inhabitants, and committing the most barbarous depredations. A conspiracy was in consequence formed against him; and as he was advancing against the insurgents at the head of a few troops, he fell into an ambuscade where he was expecting his own advanced guard, and fell pierced with balls. His power was disputed by various chiefs, of whom those best known and most successful were Petion and Christophe, the former ruling over the north of the island, the latter over the southern districts. Each having a powerful body of adherents, a civil war was the immediate consequence of their rival claims. In this war, which continued for several years, many battles were fought and many lives were lost; but the issue of the struggle was still doubtful, when in the year 1810 a suspension of hostilities took place, though no formal treaty was signed. From this period civil war ceased in the island of San Domingo. Christophe was declared king of Hayti under the title of Henry I.; and, in imitation of other monarchs, he created various orders of nobility, together with numerous officers of state. He assumed to himself absolute power, and committed the greatest cruelties, according to the mere caprice of his own arbitrary will. His tyranny produced general discontent, and at last an insurrection against him. Being deserted by his troops, he anticipated his fate by committing suicide on the 20th of October 1820. Petion died in March 1818, after having presided over the republic upwards of eleven years. He was succeeded by General Boyer, who ruled over the northern division of the island until the year 1820; when taking advantage of the death of Christophe, and the confusion occasioned by that event, he pressed forward with a considerable force, and took possession of every strong place in the kingdom; and in this manner the whole French division of San Domingo was united under one ruler.

The Spanish division of the island had been ceded to France in 1795 by the treaty of Basle, but it was restored to Spain by the peace of 1814. The feeble government of the mother country, however, was no longer able to control the revolutionary spirit which prevailed in the colony; and in November 1821 the Spanish governor was arrested by the insurgent party, headed by a lawyer of the name of Nunez, and a declaration of independence immediately issued. A strong party afterwards appeared in favour of a union of the whole island under one chief. On the 21st of January 1822 the Haytian flag was first displayed in the city of San Domingo; and on the 9th the keys of the city, and with them the dominion of the whole island, were surrendered to President Boyer. The independence of the new state was recognised by France in 1825, on condition that its ports should be open to the ships of all nations; that French vessels should pay only half duties; and that 150,000,000 francs, or L.6,000,000, should be paid as an indemnity, in five equal payments, the first on the 31st December 1825. Thus, after a series of struggles, beyond all example bloody and ferocious, the whole island of Hispaniola, with its adjacent islets, became subject to one government, under the title of the Republic of Hayti.

Boyer continued to reign over the entire island till 1843, when he was overthrown and driven from the island by a revolution headed by Rivière, who succeeded him as president. After about four months the Spanish part of the island revolted, and Rivière marched with an army to reduce it to submission; but while on this expedition the other parts of the island revolted against him, and he was compelled to escape to Jamaica. A succession of presidents of short duration followed; and on March 1, 1846, Soulouque, the present emperor, was elected president.

Previous to his election as president, Soulouque (the present Emperor Faustin) was unknown to fame. Born a slave, he subsequently obtained his liberty, and became boots' cleaner to one of the illustrious black generals. He gradually rose by energy and undaunted courage, soon obtaining the rank of captain, and subsequently that of general. His ambition was thoroughly aroused by his rapid promotion, and he secretly resolved to emulate the achievements of Napoleon I., whose career he studied as a model, brooding over his plans for three years. In 1849 he carried them into execution by a stratagem. In April an alleged plot to assassinate the president was made the pretext for arresting all those persons he deemed likely to oppose his views. Of these he beheaded a great number, and many fled. In Port-au-Prince, his capital, a petition was got up on the 20th of August, requesting him to accept the imperial crown. No one knew where this petition originated, but it was signed by 354 citizens. This, with two other petitions, one signed by forty-nine generals, and the other by all the colonels, was presented to the Chambers on the 24th; and though it took them by surprise, they adopted the petitions unanimously. Next morning it was referred to the senate. Meanwhile a crown and imperial insignia had been procured and placed on the table in the Senate House. Soulouque modestly accepted the dignity thus "thrust upon him," and received the salutation of Emperor Faustin I.

The first act of the new emperor was to create a nobility; and dukes, marquises, counts, and barons, were created in great numbers. Bobo, an escaped galley-slave, was created prince of the empire; and all the nobles aimed at superseding Soulouque. Moreover, they all acted as spies upon one another, thus keeping the emperor well informed of what was going on. As might have been anticipated, Prince Bobo was the most violent, and was summoned to court; but knowing that death was certain whether he obeyed or refused, he fled.

Soulouque now resolved upon a solemn coronation in imitation of Napoleon I. Accordingly, on April 4, 1851, new uniforms were distributed to the troops, and on the following Sunday the ceremony of blessing and distributing eagles took place. On the 17th of April at sunset 101 guns announced the commencement of festivities in honour of the coronation. These continued during seven nights and seven days. On the morning of the 18th Soulouque, imitating his great model, took with his own hands the crown from the altar, crowned himself and then his wife Adelina.

The empire is divided into six departments, and these are subdivided into arrondissements and communes. The laws are based on the *code civil* of France. The force of the Haytian army is stated at 28,000 or 30,000 men, but of these about one-half only are considered effective.

All the European powers have consuls or consular agents accredited to Faustin I. He has no male issue, and his death will be the signal for another revolution.

Hayti.

The revenue of Hayti arises chiefly from customs and port-dues, territorial imposts, sale of lands, &c. In 1850 the customs' receipts amounted to L.170,000; and in the same year the expenditure amounted to L.216,856. The established religion is Roman Catholic; but other forms of worship are not prohibited. Church affairs are superintended by a vicar-general. In 1854 there were in the state 62 schools and 4 colleges, having in all about 9000 or 10,000 pupils.

The foreign commerce of Hayti is wholly in the hands of foreign merchants, who are permitted to reside only at certain ports, under irksome and injurious restrictions. The foreign commerce does not now exceed L.1,000,000 of annual value. The exports are chiefly mahogany and other timber, dyewoods, coffee, tobacco, and cotton. The imports are British cotton and woollen goods, hardware, cutlery, fire-arms, gunpowder, glass, earthenware, &c. From France are imported brandy, wines, silk, and fancy goods. The population of Hayti is estimated at about 740,000.

The emperor has constituted Cap-Haytian, formerly Cap-Français, the capital and seat of government of the empire. It stands on the N. coast, in N. Lat. 19. 46., and W. Long. 72. 10., and contains about 14,000 inhabitants. The population of Port-au-Prince, the former capital, is 30,000.

On the fall of Boyer, the Spaniards asserted their independence, and on the 27th February 1844 proclaimed the Dominican Republic. Hérard Rivière, who succeeded Boyer, marched with an army of 20,000 men upon San Domingo, but was defeated at Azua by General Pedro Santaña, who compelled the Haytians to retreat within their own territory. The provincial junta of the new republic now formed a constitution, and elected Santaña president. He was followed by General Jimenes in 1848. Soulouque, then president of Hayti, attempted in 1849 to reconquer the territory with an army of 5000 men, but was signally defeated at Las Carreras, on the River Ocoa, 21st April 1849, by Santaña, who had only 400 men under his command. For this victory Santaña received the title of "Libertador de la Patria." General Jimenes, the president, not being fitted for his task, and the invading army having been driven out of the country, Santaña was called upon to restore order within the republic, and to force the president to resign. This effected, Santaña directed the affairs of state until a new election had taken place, by which, upon his recommendation, Buenaventura Baez was named president. During his administration treaties of recognition and commerce with Great Britain, France, and Denmark were concluded. On the 3d July 1853 Baez was banished, and Santaña himself raised to the presidency. It may be stated that Spain has not relinquished her claims upon her former colony.

The Dominican Republic claims for its territory the whole of the Spanish portion of the island. It is divided into five provinces, and has an area of about 17,500 square miles.

The Dominicans are almost entirely an agricultural people. The staples of the S. provinces consist chiefly of the products of the forests. In Seybo, however, the raising of cattle is the chief occupation. But by far the most industrious part is the N., generally called the Cibao, where the staple article is an excellent quality of tobacco. The articles of export are mahogany, satin-wood, fustic, lignum-vitæ and brazil-wood; tobacco, hides, &c. The imports are chiefly flour and provisions from the United States, and general merchandise from Europe.

The constitution of the republic is based on that of Venezuela. The Congress, which assembles annually, consists of fifteen deputies, three from each province, who form the Tribunado or Lower Chamber, and five senators, one from each province, constituting the Consejo Conservador or Upper Chamber. The executive power is vested in a president, who is elected for four years, and who must be a Dominican by birth, and at least thirty-five years of age. The judiciary is exercised by a supreme court and various inferior and local courts, and the French code has been adopted in legal proceedings. In 1852 the revenue amounted to L.76,853, and the ordinary expenditures amount annually to about L.51,300. No foreign debt is owing; but there exists a large home debt, on which the currency is based, and which is of low and fluctuating value. The army amounts to 12,000 men, and may be raised to 16,000. The navy consists of three corvettes and five schooners equipped as war vessels, and mounted with forty-four guns. The prevailing religion is Roman Catholic, but other denominations are tolerated. Pop. about 136,500.

Hayward || Hazlitt.

The chief seats of commerce are San Domingo city and Samana, a small town on a peninsula of the same name. The city of San Domingo is situated at the mouth of the Ozama, on the southern coast, in N. Lat. 18½, and W. Long. 70°, and is the oldest European settlement in the New World, having been built by Columbus in 1504. The population is about 14,000, and the town is defended by substantial fortifications. The cathedral is more than three centuries old. The harbour is capacious, but owing to a bar at its mouth, vessels drawing above 13 feet of water are obliged to anchor in the open roadstead.

HAYWARD, the person who keeps the common herd or cattle of a town, and guards hedges and fences.

HAZARD, a game at dice, without tables. It is played with only two dice; and as many may play at it as can stand round the largest round table.

Two things are chiefly to be observed, main and chance; the latter belonging to the caster, and the former, or main, to the other gamesters. There can be no main throw above nine, nor under five; so that five, six, seven, eight, and nine are the only mains thrown at hazard. Chances and nicks are from four to ten. Thus four is a chance to nine, five to eight, six to seven, seven to six, eight to five, and nine and ten a chance to five, six, seven, and eight; in short, four, five, six, seven, eight, nine, and ten are chances to any main, if any of these nick it not. Nicks are either when the chance is the same with the main, as five and five, or six and twelve, seven and eleven, eight and twelve. Observe, however, that twelve is out to nine, seven, and five; eleven is out to nine, eight, six, and five; and ames-ace, and deuce-ace, are out to all mains whatever.

HAZAREEBAGH, a town of Hindustan, and the principal place of the district of Ramghur, one of the lower provinces of Bengal. Upon the subjugation of Sinde by the British the town of Hazareebagh was selected as the place of residence for the ex-ameers of that country; but under subsequent arrangements some of the brothers have been permitted to remove to Lahore and other localities. Lat. 24., Long. 85. 24.

HAZEBROUCK, a town of France, capital of a cognominal arrondissement in the department of Nord on the Beurre, 24 miles W.N.W. of Lille. It possesses several handsome public buildings, among which are the parish church with a lofty and elegant spire; the town-house; the sub-prefecture; and the old Augustine convent, now used as college lecture-rooms; normal school, hospital, corn market, and tobacco warehouse. Hazebrouck is the seat of a court of primary instance, and has a society of agriculture, a public library, and two theatres. The principal manufactures are linen cloth and thread, soap, leather, beer, salt, oil, and lime. A large weekly market is held here on Saturday. Pop. (1851) 7539.

HAZEL. See BOTANY; nat. ord. *Corylaceæ.*

HAZLITT, WILLIAM, a distinguished critic and miscellaneous writer, was born at Maidstone, April 10, 1778. His father was a Unitarian minister, who, after holding various livings in England and America, was finally settled at Wein in Shropshire, where the young Hazlitt was first sent to school. In due time he was sent to complete his studies at the Unitarian College at Hackney. He ought to have devoted himself to theology, as it was intended that he should adopt his father's profession; but finding political and moral philosophy more to his taste, he neglected the studies proper to the place, and ended by deciding on the choice of a new profession. He determined to become a painter; and about the beginning of the century visited Paris, where he studied with great diligence and some success at the Louvre. On his return home he began a tour of the provinces, and painted a large number of portraits. Finding, however, that he was not likely ever to reach the high standard of art which he had set for himself, he abandoned art, as he had abandoned the church, and began life once more as a litterateur. In 1805 he published his first important work,—the only one, as he himself said, on which he ever prided himself. It was an anonymous essay on the *Principles of Human Action*, and certainly displayed great ingenuity and acuteness, along with some of those crudities of composition that generally mark a first attempt. More notice was taken of his *Free Thoughts on Public Affairs*, published in the following year. In 1808 he married his first wife, the sister of Dr, afterwards Sir John Stoddart, and retiring with her into Wiltshire, supported himself there for several years by miscellaneous literary labour. By this lady he had several children, all of whom, with the exception of one son, died in early childhood. The marriage, however, was in some respects an unhappy one, and in 1823 the contracting parties were divorced. In the following year, Hazlitt married the widow of a Lieut.-Col. Bridgewater who brought him a considerable fortune.

In 1811 Hazlitt removed to London, where he rented the house at Westminster that had once been tenanted by Milton. This circumstance he commemorated on a small tablet which he erected in the yard at the back of the house, in his veneration for the poet and patriot. Mr Bentham was his landlord, and on one occasion nearly drove him mad by proposing to cut down two beautiful trees that shaded this tablet, and to convert the little garden from an ornamental into a merely useful object. In 1813 Hazlitt delivered before the Russell Institution a series of lectures on the history and progress of English philosophy, some of which were published after his death among his *Literary Remains*. About this time also he became connected with the press, contributing political and theatrical criticisms to the leading journals, such as the *Times*, *Examiner*, *Morning Chronicle*, and others. His political articles were collected and republished in 1819 by Mr Hone, who had been encouraged to take this step by the success that had attended the reprint of Hazlitt's theatrical criticisms, published by Stoddart in 1818, under the title of a *View of the English Stage*. One service Hazlitt did to the stage which should never be forgotten. He was the first to discover and proclaim the wonderful powers of Edmund Kean, which were at length, though not till after a severe struggle, recognized by the world. In 1818 he delivered a series of lectures at the Surrey Institution on the Comic Writers, the Poets of England, and the Dramatic Literature of the age of Elizabeth. These three courses have been published in separate volumes, and are well known to all students of English literature. His next acknowledged work was his *Characters of Shakspeare's Plays*, which displays a refined and philosophic taste, and abounds in occasional passages of rare eloquence. From this time to his death he continued to contribute very largely to the periodical press, from the *Edinburgh Review* downwards. Though his literary gains were considerable (averaging about L.600 a year), yet his imprudence in money matters prevented him from making any provision against old age or infirmity. In 1830 his health gave way under the unabated pressure of literary toil, and after suffering for some weeks under a severe dysentery, he died on the 18th September.

Hazlitt was the author of many works besides those already mentioned. Of these the most important were his *Spirit of the Age*, in which he passes in review the leading notabilities of his day, and in his judgments of some of them at least, anticipated the verdict of posterity; his *Plain Speaker*, 1826; his *Table Talk;* the *Round Table* (some of the essays in which are from the pen of Leigh Hunt); the art. *Fine Arts* in the *Encyclopædia Britannica;* and the *Life of Napoleon*, which was published in 1830, shortly before his death. This last, though by no means the most popular of his works, is that on which he put out most of his mind. Napoleon was his great idol among men, and he strove by this *History* to raise a suitable monument to the glory of his hero. As a historian, indeed, Hazlitt has but small chance of being acknowledged by posterity. His political prejudices were too fierce and active; and his style, so well adapted for general literary composition, was on that account unsuited for history. His real title to remembrance is in his criticisms on art, literature, and literary men. As a writer, Hazlitt is forcible, terse, and lively. All his writings abound in passages of vehement eloquence, alternating with brief utterances, pregnant with thought, and striking from their simplicity and truth. Though, strictly speaking, the true sphere of his mind was criticism, it had yet some of the qualities of the poetic temperament. He had a fancy so fertile that he sometimes wearies with the wealth of his imagery and the copiousness of his illustration. He luxuriates in his command of style so as sometimes to make the reader wish that his power was less, or his self-control greater. The perusal of his works convinces his readers that he is a brilliant, sometimes even a splendid writer, but it would seem as if he strained himself too incessantly to produce effect, so that while he always dazzles, he does not always satisfy. As a man he was as much admired as liked. His temper, naturally irritable, had been soured by various causes, among others, by over-indulgence in wine. As soon as he came to know, however, the danger of too social habits he eschewed drinking altogether, and for the last sixteen years of his life used no stimulant but tea. His irritability often involved him in serious misunderstandings with his best friends, yet none was ever readier than he to hold out the hand when the storm had passed. He was a perfectly honest and brave man, and though a recantation of his political creed might have carried him on to wealth and station, he remained to the last as staunch a friend of the people and the people's interests as he had been in the heat of youth.

HEADBOROUGH. See Borseholder, and Tithing.

HEALFANG, or Halsfang (Sax. *halp*, neck, *pangen*, to contain), in our ancient customs, the punishment of the pillory. Also a pecuniary mulct in commutation of the punishment of the pillory, to be paid either to the king or the chief lord. *Qui falsum testimonium dedit, reddat regi vel terræ domino* healfang.

HEALTH, Board of, a commission appointed by the English government in 1848 with the view of promoting the public health in England and Wales, which, in that and the preceding year had suffered seriously from the invasion of cholera. As first constituted, the Board of Health comprised the First Commissioner of Woods and Forests as president, and two other persons nominated by the Crown. The board continued on its original footing for only five years. Under the supervision of this general board, local boards, appointed on different conditions, in various places, were empowered to enforce the Public Health Act. In 1854 the constitution of the board was remodelled. Its duration was made annual, and along with the president (who was appointed by the Crown with a salary of L.2000) were associated the principal secretaries of state, and the president and vice-president of the Board of Trade. The president, however, has power to act alone, and is in fact a minister responsible for the department under his charge.

HEAT.

Definition ‖ Nature of Heat.

THE term HEAT, in common language, is applied both to the sensation excited in us by the approximation of a warm body, and to the cause of that sensation. To obviate this ambiguity, chemists and other cultivators of physical science have employed the word *caloric* to designate the cause of heat; but as there are few disquisitions in which this distinction is material to perspicuity, in this article we shall use either term to signify the cause of the sensation.

SECT. I.—NATURE OF HEAT.

One of the first inquiries that suggests itself is, what is *caloric?* Two opinions on this subject have divided philosophers. The most generally received opinion is, that heat, or caloric, is a material agent of a peculiar nature, highly attenuated, and, from its affinity or attraction for all other matter, universally distributed amongst the particles of bodies, in quantities proportional to their mutual attractions, or, as it has been termed, the *capacities* of different substances for heat; whilst its tendency to diffuse itself amongst contiguous bodies has been explained on the supposition of its own particles being repellent of each other. The other opinion, which has been maintained by Bacon, Boyle, and several other philosophers, considers heat as a mere quality of matter, and ascribes it to a vibratory movement among the intimate particles of bodies; an idea which was adopted by Rumford, to explain his curious experiments on the excitation and communication of heat by friction. This opinion, however, seems vague and unsatisfactory. If we say that heat is motion amongst the particles of matter, still we have no explanation of the manner in which this motion is produced; for we cannot conceive any movement without an impulse, nor an impulse without a material agent. Heat pervades all sorts of matter: it remains in some circumstances dormant, or, as it is termed, *latent*, and may be again elicited from bodies by various means. Did it consist in vibrations or motions of the particles of other matter, it should pervade elastic bodies with the greatest celerity; which we know not to be the fact. It will, for instance, pervade a rod of lead, or of the softest copper, far more readily than an equal length of glass or of marble. If we mingle together equal quantities of water at different temperatures, the resulting temperature will be an exact mean between the extremes. But if heat consisted in such vibrations, there ought to have been a loss of heat, as in all other communicated motions. If we mix together equal quantities of different substances at different temperatures, the resultant temperature is not a mean: one body has lost more heat than the other has appeared to gain, or a part of the heat of the one has become latent in the other, and that in a constant ratio to the power of each substance of absorbing heat, as tried by comparing each with a third body in the same manner. It is very difficult to conceive this species of interchange, if heat merely consisted in vibrations amongst the particles of matter. Still more difficult is it to conceive how a permanent temperature could subsist among a great system of bodies, as the planets, if heat were nothing more than a vibration of the particles of bodies; for the original impulse ought to diminish with each communication.

It is possible, however, to modify this theory, by supposing that heat is produced not merely by the motions of the particles of the heated substance, but by the vibrations or undulations of a very subtile matter existing in all bodies. This will approximate the vibratory theory to that which has been generally considered as its antagonist, will accord well with some recently discovered facts, and will assimilate the vibratory hypothesis of heat to the undulations now so generally received as explanatory of the phenomena of light, to which heat has so intimate a relation.

Nature of Heat.

Caloric, like light, has been proved to be capable of radiation, of reflection, and refraction, whilst later investigations have distinctly proved that refracted heat is susceptible of polarisation. But it is transmitted, reflected, refracted, and polarised by different substances in a different manner and degree from light; and hence some have inferred that light and heat are not the same agent, but are produced by different kinds of matter. Other philosophers have regarded them as modifications of the same matter, depending on the greater celerity or velocity of the undulations that produce them. Such speculations, however, are not yet susceptible of any direct proof; and, in the present state of our knowledge, it is safer to consider light and heat as produced by different but intimately connected agents.

These views lead us to the conclusion that the phenomena of caloric are owing to the movements of a subtile matter, universally diffused throughout other bodies, the particles of which are strongly repellent of each other, and have an affinity for those of all other bodies, differing in force according to each kind of matter. We may further conceive, that heat or caloric is the cause why the particles of the most solid bodies are not in absolute contact. If we diminish the temperature of a bar of iron, for instance, it shrinks in all its dimensions, *i. e.* its particles approximate; and the more we reduce the temperature, the nearer they approach. Each particle of matter would seem to be surrounded with an atmosphere of heat, which remains *latent* or quiescent, until disturbed by the approach of bodies of a different temperature, when the vibrations or undulations of the subtile matter of heat are induced, by the tendency of this matter to produce an equilibrium of temperature; and then we become sensible of the existence of heat.

The subtilty of the matter of heat is such, that we cannot ascertain its accumulation in any body by the nicest balance; its fluidity may be considered as proved by the ease with which it insinuates itself amongst the particles of matter; its affinity for other matter is shown by its being universally contained in all bodies, in proportions differing in each kind of substance; its repulsion amongst its own particles is proved by its tendency to exist in a state of equilibrium in contiguous bodies.

Our knowledge of the laws which regulate the distribution of caloric was very imperfect when we possessed no other measure of heat than our sensations. The susceptibility of the sense of touch varies in different individuals, and in the same individual at different times. We can even make the same object feel warm and cold to the same person, by previously cooling one hand, whilst the other is immersed in a warm fluid. Hence sensation could never afford any tolerable measure of varying degrees of heat; and we are indebted for more accurate notions on the subject to the invention of *thermometers*. The principle of these instruments depends on the expansion of solids, fluids, or gaseous bodies by heat, and their subsequent contraction on cooling. The construction of these useful instruments will be described under the article THERMOMETER. It will be here sufficient to state, that though the thermometer affords us indications of the changes in the sensible heat of bodies, it does not give us any information respecting their latent caloric, nor the absolute quantity of heat

Diffusion of Heat.

they may contain. This must be sought for by other modes, which we shall shortly explain, after we have considered the modes in which caloric is diffused amongst bodies, and its general effects on different kinds of matter.

SECT. II.—DIFFUSION OF HEAT.

The tendency of heat to diffuse itself equally amongst bodies is so great, that we are unable permanently to accumulate it in any substance. All that can be effected in this way by the most skilful contrivances, is to produce some retardation of this dissipation. The mode in which it is diffused through solids, liquids, and gases, is different, and demands a separate consideration.

I. *Diffusion of Heat by Communication.*

1. *Diffusion in Solids.*—When we place a heated solid in contact with a colder body, the superabundant caloric of the first immediately begins to flow into the latter. The nearest particles are first heated, and they communicate a portion of their caloric to the second series, and these last to a third, until both bodies acquire a common temperature; and this equilibrium will be established amongst all contiguous bodies. If a bar of iron twenty inches long be heated at one end, it will require four minutes for the smallest sensible increase of temperature to be perceived at the other. Biot has endeavoured to ascertain the rate of this transmission. He employed a bar of iron several feet in length, and bent into a right angle, at one end of which a steady heat of 216° Fahrenheit was applied. Thermometers were placed in holes drilled for the purpose, at intervals of four inches along the top of the bar. In four hours all the thermometers became stationary, the difference between the first and second = 21°·50; between the second and third, = 11°·25; between the third and fourth, = 7°·25; between the fourth and fifth, = 5°; between the fifth and sixth, = 4°; between the sixth and seventh (beyond which no sensible effect was perceptible), = 1°·75; which, allowing for the unavoidable errors in such investigations, would show, that, taking the distances in arithmetical progression, the decrease of temperature follows a geometrical ratio in penetrating solids. In such cases, the heat seems to be communicated from particle to particle, and is said to be *conducted* through the body.

All bodies do not *conduct* heat with equal celerity. If we place equal thermometers on equal cubes of metal, ivory, marble, and glass, heated by the same source, we shall find that the thermometer placed on the metal will rise soonest; next, that placed on the marble, then those on the ivory and the glass. The most dense bodies conduct heat, in general, more readily than rarer bodies; but experiment shows that their conducting power is not always in the ratio of their density, but probably depends also on their affinity for caloric. Spongy and light bodies are found to be extremely bad conductors of caloric. Silk, cotton, and wool, are especially so; and hence their utility in preserving our animal heat in cold climates. Count Rumford made a series of experiments on the conducting power of different substances of this nature, and found that raw silk, fur, and eider-down, were remarkably bad conductors of heat. They give to us the sensation of warmth, not by communicating heat to our surface, but because their bad conducting power prevents the waste of our animal heat by the ambient air. Their stopping the transmission of heat seems partly to depend on the air they entangle; for, by twisting them, *i. e.* by expelling a portion of the air contained in such bodies, their conducting power is increased.

The facility with which bodies conduct heat is not exactly in proportion to any of their sensible qualities, but is more nearly in the direct ratio of their density than any other quality. This may be ascribed to the greater intensity of the repulsive energy of the atmospheres of caloric surrounding each particle of dense bodies (by reason of their greater proximity) conveying each fresh addition of temperature with greater celerity through such substances. But if we conceive "heat to be a material agent," this quickness of conducting power may also be modified by the different degrees of affinity between caloric and each kind of matter. However this may be, scarcely any two substances conduct heat with equal facility. Solids conduct much more readily than liquids. Of the former, the best conductors are the metals; and amongst these, the very best are gold, silver, platinum, and copper, whilst iron and lead are among the worst. The rapidity with which silver conducts away heat is well illustrated by wrapping a piece of muslin smoothly round a spoon of that metal, when the muslin may be held in the flame of a candle or a lamp, so as to boil water in the spoon, without burning the muslin.

The following table of the conducting power of different metals and other bodies is given by Despretz (*Ann. de Chim. et Phys.* xxxvi.):—

Gold	1000	Tin	303·9
Platinum	981	Lead	179·6
Silver	973	Marble	23·6
Copper	898·2	Porcelain	12·2
Iron	374·3	Clay	11·4
Zinc	363		

2. *Diffusion in Liquids.*—The extreme slowness with which liquids conduct heat is shown by a beautiful experiment of Count Rumford. Freeze a little water in the bottom of a tube, and then pour water over the ice: by inclining the tube, the flame of a lamp may be applied to the surface of the liquid, so as to cause it to boil; and by slowly moving the flame towards the ice, we may raise the water to ebullition in successive portions; yet this ebullition will almost reach the ice before it shows any signs of melting. The same fact is exhibited by fixing an air thermometer in a vessel filled with water to one or two tenths of an inch above the ball of the thermometer, and pouring a little æther on the surface of the water. On kindling the æther, it will burn with a copious flame, without affecting in the slightest degree the submersed thermometer. This extreme slowness of liquids in conducting heat induced Count Rumford to suppose that they were absolute non-conductors of caloric; but this inference is not warranted by his own experiments, and was fully refuted by the investigations of Hope, Murray, and Traill, which proved, that though liquids conduct heat slowly *downwards*, they are not absolute *non-conductors* of caloric.

If, however, we apply heat to the lower part of a vessel containing any liquid, it rapidly acquires a higher temperature. This, however, is in a different manner from *conduction.* The liquid is heated by the *transportation* of its particles in quick succession. In this case the particles nearest the heating cause become specifically lighter by receiving heat; they therefore ascend through the fluid, to which they impart part of their caloric, while their place is supplied by another series of particles, which become heated, and ascend in their turn; and this succession continues until, by these rapid changes, the whole body of the fluid attains its boiling point, if the heat be sufficient for that purpose. These motions may be rendered visible by throwing into the vessel a few particles of matter a little heavier than water, such as powdered amber.

It is by this transportation of their particles that liquids are principally heated; and the rapidity with which a piece of ice melts when it floats in a jar containing hot water, compared to the extreme slowness of the melting of a similar mass of ice fixed in the bottom of a jar, and defended from the immediate contact of the hot water by a thin film of ice-cold water, exhibits, in a striking manner, the difference between the heating of fluids by *transportation* and by *conduction*.

3. *Diffusion in Gases.*—The conducting power of gases is not so easily ascertained, because it is difficult to separate their conducting power from the effect of radiation of heat through them. The experiments of Professor Sir John Leslie and of Dr Dalton, however, decidedly show a difference in the conducting power of gases, which is also more nearly in the direct ratio of their specific gravity than of their other properties; hydrogen having the lowest conducting power, atmospheric air one considerably higher, and carbonic acid the greatest of all the gases subjected to this examination.

The difference of bodies in conducting heat is a most important subject, as on it depends not only many of our contrivances to concentrate artificial heat, and apply it to numerous purposes in the useful arts, as the obtaining of metals from their ores; but on it also depend the methods of defending our bodies against external cold. The living system has within itself the power of supporting a nearly equable temperature, notwithstanding the perpetual tendency of contiguous bodies to a common temperature; but if the naked surface be exposed to the elements in our climate, the heat of the body would soon be reduced below what is consistent with health or comfort. To preserve the animal heat, we surround our bodies with bad conductors of caloric, such as woollen, silk, or cotton; and the more imperfectly these defences conduct heat, the less will our temperature be reduced. Hence the worst conducting substances are the most suitable garments for a cold climate; and, in hot latitudes, the comfort of man requires that the coverings of his body should be of the kind that would most rapidly abstract his redundant animal heat.

Nature has beautifully adapted the covering of the lower animals to the climates they inhabit. The thick fur of the Greenland bear, the musk ox, and the arctic hare, adapts them to the rigours of their native climate; whilst the short and sleek hair of the antelope, the giraffe, the leopard, and the lion, proclaims them denizens of the warmer regions of the earth. Even in the same species inhabiting a changeable climate, nature adapts their covering to the season. The glossy sleekness of the horse, and of our domestic cattle, diminishes toward the close of autumn. The bear, the fox, and the weasels of northern regions, assume a longer and more shaggy coat on the approach of winter; and the sheep, which in Europe is covered with a thick fine wool, an extremely bad conductor of heat, in the burning plains of Africa is clothed only by a short and coarse hair, that presents comparatively a small obstacle to the evolution of animal heat.

In the vegetable kingdom a similar care is bestowed to defend plants from excessive cold. Plants of cold climates, which are perennial, are protected by a considerable thickness of bark; a substance which experiment proves to be a bad conductor of heat. In high latitudes they are further defended against the excessive cold of the climate by a spongy covering of snow, which, until it begin to melt, is found to be a very bad conductor of heat; and therefore tends to preserve the juices of plants from being frozen. Thus trees are more seldom killed by the freezing of their sap, when a fall of snow has preceded an intense frost; an accident not uncommon, even in the temperate climates of the earth, in a long continuance of what is termed a *black frost*. Recent voyages of discovery have also shown that the Esquimaux find the excessive rigour of their inhospitable climate very endurable in houses built of frozen snow.

II. *Diffusion of Heat by Radiation.*

The diffusion of heat by the means already noticed is a comparatively slow process, and is limited to bodies in contact with each other. But heat is capable of being diffused among bodies not in contact. A heated body suspended *in vacuo* emits its excess of heat in all directions; and in air, though much of its caloric apparently passes off with the ascending currents which it produces in the ambient air, the emanations of heat also pass off in directions contrary to these aerial currents. Thus a person standing before a fire perceives its warmth, though a light body like a feather will show that there is a current of air perpetually flowing toward the fire. This emission of heat is termed *radiation*, and is analogous to the emanations of light from a luminous object; each point of the heated surface emitting divergent rays, which are subject to the same modifications as those of light, by reflection from polished surfaces, and by refraction through transparent media.

When the rays of heat fall on a bright metallic surface, they are *reflected*. As early as 1682, Mariotte showed that "the heat of a fire is reflected from a burning mirror, so as to be sensible in its focus; but that it is intercepted by a plate of glass interposed between the mirror and the fire." The next important step was made by Lambert, who discovered that the heat might be so increased, by employing two concave mirrors and a charcoal fire placed in the focus of the one, that a combustible might be kindled in the focus of the other. But the most successful cultivator of this branch of science during the last century was Scheele of Sweden, who proved that metallic surfaces are the most powerful reflectors of radiant caloric; that glass is far inferior in this respect; that if we cover the surface of the metallic mirror with a film of lamp-black, it does not reflect heat, but actually absorbs it; that radiant heat is separated from light by interposing screens of glass; and that it passes through air, without suffering any obstruction from the direction of the aerial currents through which it radiates.

Saussure and Pictet repeated the experiments of Lambert. They showed the instantaneous transmission of heat by radiation; that it was in such experiments material to place the heated body and the thermometer in the focus of each mirror; and that, a very little beyond the focus, the effect was trifling, although the thermometer was nearer the heated body. When the heated body was a red-hot cannon bullet, combustibles were speedily kindled in the focus of the other mirror at the distance of several feet. These researches were greatly extended by Pictet, who showed that a flask of hot water radiated heat which could be concentrated in the focus of a metallic mirror, and thus rendered sensible by a thermometer, showing that the invisible rays of heat might be reflected, as well as those emanated from a hot luminous body.

The experiments on radiant heat may be exhibited by means of a pair of concave mirrors of well-polished tinned iron, hammered into segments of spheres of about one foot in diameter; but still better with mirrors of thick brass plate, hammered, on Sir John Leslie's plan, into a parabolic form. The writer of this possesses a pair twenty-two inches in diameter, hammered into a parabolic curve with surprising accuracy, by Mr Alexander Kilpatrick of Edinburgh, with which he has repeatedly melted lead by collecting the sun's rays in one of them. This form of mirror is the best; because the rays which fall on the mirror parallel to its axis are reflected, not divergingly, but so as to meet in the focus of the parabola.

Pictet found the sensibility of the thermometer much increased by painting its ball black; and he showed that glass screens intercepted the rays of caloric from burning bodies or a heated bullet; but it was found that the radiant heat in the sun's rays was not intercepted by a plate of glass, or even by a sheet of tin, which completely intercepts heat derived from other luminous bodies.

Such was the state of our knowledge of radiant heat, when our veteran astronomer, Sir William Herschel, discovered, toward the close of the last century, that rays of heat exist, independently of those of light, in the solar spectrum. When he received the solar rays through a prism of flint-glass, he found that a row of delicate thermometers placed in the coloured spectrum were differently affected at its two extremities. In the violet ray it only rose 2°, in the red ray it rose 7°; but his most interesting discovery was, that half an inch beyond the red ray it was still hotter. These very important results were fully confirmed by Sir Henry Englefield. In one of Englefield's experiments, the following results were obtained:—In the blue rays, in 3′ the thermometer rose 2°; in the green, in 3′ it = 4°; in the yellow, in 3′ it = 6°; in the middle of the red, in 2′·5 it = 16°; in the outer edge of the red, in 2′·5 it = 17°·5; and beyond the spectrum, in 2′·5 it = 18°. When the bulbs of the thermometers were previously blacked, the full red ray raised the thermometer in three minutes 22°; and just beyond the spectrum it rose 33°. Even half an inch beyond the spectrum altogether, the rise was 6° more than in the red ray.

These experiments show that the refrangibility of the rays of heat and light are different, and that the former are less refrangible than the latter.

The experiments of Berard and of Leslie confirmed the fact, that the point of greatest heat in the solar spectrum is in the red rays; and Leslie states the result of his experiments to have made the difference between the violet and red as one to sixteen; but neither of these philosophers detected any heat altogether beyond the spectrum. The conclusions of Herschel have, however, been confirmed by subsequent investigations; and Seebeck has shown that prisms of different substances produce a different refraction of the rays of heat. With a hollow prism filled with water, the greatest heat is in the full yellow light; with sulphuric acid it is in the orange; with crown glass it is in the dark limit of the red.

We may here state, that not long after Herschel's discovery, Ritter, Wollaston, and Beckmann, simultaneously discovered the existence of other invisible rays in the solar spectrum, which are only known by their chemical effects in decomposing some metallic saline compounds, as the nitrate of silver. These *chemical rays* are the most refrangible of all, and exist in greatest abundance toward the violet end of the spectrum, and even entirely beyond it. Thus the solar spectrum would seem to consist of three species of rays, the luminous, the calorific. and the chemical; all differing in their refrangibility, and in their apparent effects: and if we consider white light as composed of red, yellow, and blue rays, we have five kinds of rays in the solar beam, three of which are visible, and two invisible. In the solar beams these are intimately blended, but may be in some degree separated by refraction through diaphanous prisms. The separation of the luminous and calorific rays may be made by black opake bodies, through which the sun's heat will penetrate without admitting a single ray of light. The sun's rays, however, pass through all transparent media, without a separation of light and heat. Glass and ice intercept the rays of terrestrial heat, the first partially, the latter wholly; yet the sun's rays passing through and collected in the focus of a lens of glass, produce the most intense heat; and Scoresby and others have shown, that a lens of *ice* will concentrate the sun's rays, so as to ignite inflammable substances.

The publication of Sir John Leslie's *Inquiry into the Nature of Heat*, in 1804, forms an important era in the history of the radiation of caloric. This very original and able philosopher, by the simplicity and delicacy of his apparatus, and the ingenuity of his well-devised experiments, did more than has been accomplished by any other individual to develop the laws which regulate the transmission and reception of this mysterious agent; and his work will remain a land-mark in the history of this branch of physical science. In his experiments, a single mirror only was employed; and the source of heat generally used was a cube or square canister of tinned iron placed before the mirror, at the distance of three or four feet, whilst the ball of an air thermometer was placed in the focus of the mirror. The air thermometer employed by him was his own modification of that figured by Sturmius. (*Colleg. Curios.* p. 53, 1676.)

In the instrument of Leslie, termed by him a *differential thermometer*, both limbs of the instrument, as well as both balls, are equal; and instead of being joined with cement, the *recipient ball* is united by the blowpipe to the same piece with the *sentient ball.* These changes give additional delicacy and accuracy to the instrument; in which the coloured fluid is sulphuric acid tinged with carmine.

Leslie's principal object was the relation of different surfaces in emitting and receiving calorific rays. Of his cubical canister, one side was polished, or, as it is termed by workmen, *planished;* the second was covered by a plate of glass; a third with white paper smoothly pasted on; the fourth was painted with lamp-black mixed with *size.* The cubes he used were from four to ten inches, and were filled with boiling water. When the polished side was turned toward the thermometer, placed at four feet from the mirror, the increase of temperature was no more than 12°; when the glass side was presented, the differential thermometer under the same circumstances rose to 90°; when the papered side was the radiating surface, the temperature was 98°, and the painted side indicated 100°; when the polish of the planished side was destroyed, by ploughing it in one direction with a fine-toothed plane, its propelling or radiating power rose to 19°; and when scratched in one direction with a fine file, its effect was as much as 26°. On covering one of the surfaces smoothly with gold and silver leaf, the effect was about equal to the surface of polished tin; a plate of polished iron gave 15°; a surface of fresh lead 19°; but when the same became tarnished, its effect was equal to 45°; and painting it with red oxide of lead raised it to 80°. An amalgam of mercury and tin, when fresh, gave no more than 20°.

Leslie then investigated the relative *receiving power* of different surfaces, by coating the *sentient ball* of the differential thermometer with different substances. When that ball was smoothly coated with tinfoil, the effect of the blackened side of the canister was only 2°·5, or about one fifth of what it produced on the naked ball; and he found, that of either side of the canister the effect was now just one fifth of that observed with the naked ball. On the other hand, when the ball was covered with a coat of china ink, or formed of a black enamel, the effect of either side of the canister was greatly increased.

The power of surfaces in reflecting heat was also investigated. In fact, it was shown by the last series of experiments with the coated ball; but he proved it also by varying the reflecting surface. When a glass concave mirror, two feet in diameter, was substituted for the metal reflector, the effect of the blackened side of the canister on the naked ball was but just perceptible; and if a film of china ink be spread over the surface of the mirror, even this slight effect totally disappears. If, however, the concave surface of the glass mirror be smoothly coated with tinfoil. the effect of the black side of the canister will be ten times more than with the naked glass surface. Removing the silvering from the back of the mirror produced no effect on its reflecting the calorific rays, neither was this affected by roughening the back of the mirror. Hence Leslie infers, that reflection of heat takes place at the surface of the glass mirror, or principally so.

A polished tin reflector had its power diminished one third by being coated as smoothly as possible with tinfoil, evidently by the imperfection of the smoothness of its surface. Scratching its surface with sand-paper diminishes its effect one tenth; and he found that the mirror seemed to have its reflecting power more impaired when the scratches were all in one direction, than when they crossed. A film of tallow on the surface of the mirror reduced the effect of the blackened side from 100° to 8°; but if held before the fire until all that could be thus removed had run off, the effect of that side rose to 37°. When the surface of the mirror was covered with a very thin iridescent film of isinglass. the blackened surface gave an effect of 80°; but when that film was only $\frac{1}{1000}$th of an inch, the effect was reduced to 15°.

The results of his experiments with other reflecting surfaces gave the following proportions:—A reflector of polished brass = 100°, of the same coated with tinfoil = 85°, of steel = 70°, of fresh lead = 60°, of glass = 10°.

The inference from these investigations is, that the reflecting power of various surfaces bears some inverse proportion to their propelling and absorbing powers. The numerical results of Leslie's experiments would give the ratio between metallic surfaces and glass, in reflecting power as ten to one; in propelling power as one to eight; in absorbing power as one to five. It was, however, supposed that some minute circumstances, of which it is difficult to estimate the effect, interfered in the two last processes, and that the propelling and absorbing powers are equal in all bodies: we shall find this to be incorrect.

One of the most interesting parts of Leslie's investigations was the effect of screens of different kinds, interposed between the sources of heat and the thermometer. When he interposed a screen of tinfoil, the effect of the blackened side of the canister was 0°; a thin sheet of crown-glass was = 20°; a sheet of common writing paper, placed about two inches from the cube, was = 23°. If the screen of any material was placed one foot from the cube, the effect was only one thirtieth of what it was at the distance of two inches. From this he inferred, that the screen prevents all transmission of radiant heat until it becomes itself heated; and then it radiates from its other surface toward the thermometer. This was confirmed by substituting a plate of ice (a substance the temperature of which cannot rise above 32° F.) for the screen, when the effect was 0°. This view he considered as confirmed by his beautiful contrivance of the *double* or compound screen. He coated one side of two plates of glass with tinfoil; when the coated sides were outermost, the thermometer did not rise; when the glass surfaces were outwards, the thermometer rose to 18°. He blackened one surface of two plates of tinned iron; when the blackened surfaces were outwards, the effect was 23°; but if the plates were separated from each other, the thermometer fell back to its former station. When the tinned surfaces were outermost, the thermometer was not at all affected.

Leslie included his whole apparatus in a trough of water, in such a way as to be able to fill the canister with hot water after the whole was adjusted; but there was no radiation of caloric.

The inference which this philosopher drew from his investigations is, that heat is an elastic substance, extremely fluid and active; and he advanced strong arguments against the theory which ascribes all the phenomena of heat to vibrations in the particles of matter. (See *Inquiry*, p. 139 to 150.) Yet he is disposed to consider the phenomena of radiation as depending on certain undulations, produced by radiating surfaces in the ambient air. This view has been ably combated by the late Dr Murray, with the sagacity which distinguished that philosopher. But the limits of the present article will not allow us to enter into this part of the subject, for which we must refer the reader to Leslie's *Inquiry*, and Murray's *Chemistry.*

The more usually-received theory of radiation is, that from heated bodies emanate rays of caloric in all directions, which proceed through gaseous bodies with little or no sensible interruption, and with amazing velocity; that these rays are absorbed by dark and rough surfaces, and are reflected by polished bright surfaces.

There is, however, one curious experiment, which is rather difficult of explanation, namely, the seeming *radiation of cold.* The Florentine philosophers of the *Academia del Cimento* found, that when a mass of snow was placed in the focus of one mirror, the thermometer placed in the focus of the other sunk, or indicated cold. This subject has been investigated by Pictet and by Leslie. The latter observed that his canister, filled with snow, produced the greatest effect when its blackened side was towards the thermometer and the mirror, and the least when its polished side was in that direction. The effect of screens, in retarding the influence of the cold body, he found analogous to their effect on the radiation from the hot water.

These facts were considered by Leslie as proving the existence of what he denominated cold pulses from the snow towards the mirror, "on the wings of the ambient air;" but the explanation of Pictet appears to account for it well, without the necessity of inferring the existence of frigorific particles, which is a highly improbable supposition. On this view, radiation is considered as only taking place amongst bodies unequally heated. He conceived that bodies at the same temperature do not radiate heat to each other, because in this state caloric exists in them all in an equality of tension; but when a cool body is introduced, all radiate heat towards it, and consequently their temperature falls. Hence radiation is nothing more than the tendency of caloric to establish an equilibrium of temperature. The rays of heat enter into the snow from the surrounding matter, and, amongst others, from the thermometer, which is now a radiating body; and these collected in the mirror pass in right lines to the snow, with a celerity in proportion to their absorption by the cold body. Hence the caloric of the thermometer will more rapidly leave it when the blackened side of the cold canister, that is, its most absorbent side, is turned to the thermometer.

Leslie explains this phenomenon by his theory of aerial pulsations. He considers the cold surface as abstracting part of the caloric of the contiguous stratum of air, which induces a momentary contraction of that portion; and this contraction produces pulsations, accompanied by a discharge of heat, in a continued chain from the thermometer and the mirror to the snow.

The effect of surface on the refrigeration of bodies, an important part of the consequences of radiation, has been ably examined both by Sir John Leslie and Count Rumford. The experiments of both show, that to preserve the heat of any liquid, a bright metallic vessel is the best; and Rumford has pointed out many important economical purposes to which these principles may be applied. Thus, where it is of consequence to preserve the heat of liquids, of steam, or of hot air, they should be conveyed in vessels and tubes of polished metal. On the other hand, if we wish to have the greatest radiant heat from a stove or grate, its surface next the room should be dark and rough, as these are the most favourable for radiating heat into the apartment. The same principles show why a silver

Diffusion of Heat.

tea-pot makes better tea, and keeps it longer warm, than a china one.

One of the most beautiful applications of the principle of the radiation of heat, is Dr Wells' explanation of the phenomena of dew and hoar-frost. Dr Wilson of Glasgow had observed, that bodies upon which dew and hoar-frost formed, were always *colder* than the surrounding air. This cold he ascribed to these depositions; but an attentive examination of facts led Dr Wells to draw an opposite conclusion, and to infer that the coldness of the bodies was the *cause* of the deposition of dew and hoar-frost. This he successfully established, by proving that, before any dew formed, the surface on which it condensed was uniformly cooler than the ambient air. And it was reserved for this accomplished man to offer a theory of those meteors, complete in almost all its parts, and perfectly satisfactory. He ascribed it to the radiation of heat, without any return from the air to the surface of the earth. He observed, that it was chiefly in serene, clear nights, that dew was formed; that exposure to the open clear sky favoured the formation of dew; and that cloudy skies were unfavourable to its formation. These phenomena he beautifully explained on the theory of radiation. The upper regions of the atmosphere are well known to be the abodes of perpetual congelation, as is seen whenever mountains reach a certain altitude, differing, it is true, in different climates, but yet invariable over the earth. When we have a clear atmosphere at night, the surface of the earth rapidly parts with the heat it had acquired during the day, by radiation to the superior regions, whence it can receive no heat in return. In this case, the empyrean regions act the part of the snow in the Florentine experiment; and the earth's surface may represent the thermometer. But if fleecy clouds intervene, they act the part of screens, intercepting the passage of radiant caloric from the earth, and consequently retarding the nocturnal cooling of its surface. Air at an increased temperature contains more water than cool air, and on the reduction of its temperature deposits its surplus water. Now, as the radiation from the earth's surface cools it more rapidly than the air during serene nights, its temperature rapidly falls, as the thermometer shows; and the consequence is the cooling of the stratum of air in immediate contact with the ground, and the deposition of its superabundant moisture, in the form of dew or hoar-frost, according to the celerity and intensity of the refrigeration.

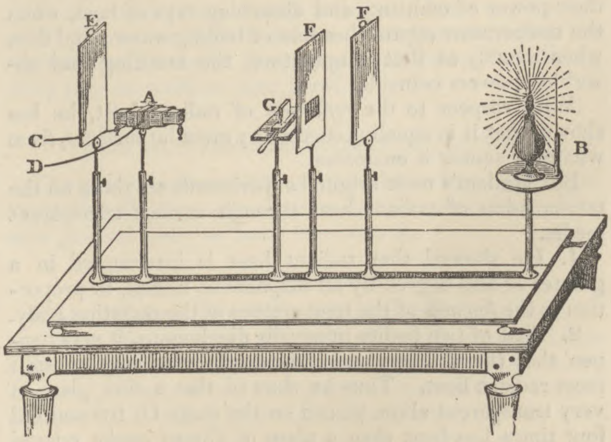
This theory is experimentally proved by placing substances absorbent of moisture, along with thermometers, below and above screens, and then noting the temperature and the increase of weight. If, for instance, a light table, about three feet high, be placed in a garden on a clear night, and a few grains of wool, previously weighed, be laid under the table, and as much on its upper surface, with a thermometer by each parcel of wool, it will be found that the upper thermometer will indicate the greatest degree of cold, and the wool on the table will have imbibed much more moisture than that below. The table, in such experiments, acts the part of clouds in intercepting the discharge of radiant heat, and preventing the cooling of the earth's surface. The theory agrees with the fact, that dew is heaviest in our climate in serene nights, after a hot day; and that the dews of hot climates are far heavier than with us, so as, in clear weather, in the south of Europe, to drench the clothes of persons exposed to the air about sunset. The slight anomalies which sometimes occur in such experiments are easily explicable by the different *conducting power* of substances in regard to heat, by which the influence of radiation may be in some degree modified; but undoubtedly the principal effect is due to *radiation*.

The influence of a clear sky in reducing the temperature of the earth's surface, and the effect of clouds in preventing this change, are beautifully illustrated by Leslie's elegant invention, the *Æthrioscope*. (See, for the description of the æthrioscope, the article CLIMATE.) This instrument is so delicate, that it instantly indicates cold on presenting its uncovered ball to the clear sky; but if a passing cloud cross the zenith, even momentarily, the movement of the fluid in its stem immediately shows an increase of temperature. If one walk in a clear night, with this instrument in one hand and a parasol in the other, it may be kept in a perpetual state of fluctuation, by alternately projecting it beyond and drawing it under the parasol.

Diffusion of Heat.

The radiant heat afforded by the sun's rays is the most important phenomenon of this class. Light and heat are in these rays so united, that experiment would seem to prove the one to be always in proportion to the other. This is by no means the case with the light and heat of common combustibles, or what we may term *terrestrial*, in contradistinction to *solar* emanations of light. Phosphorus gives an intense light during combustion, but a feeble heat; whilst hydrogen, which has a very feeble light, excites a high temperature by its combustion. Solar light and heat, on the other hand, are uniformly proportional. There are more marked differences between solar and terrestrial radiant heat. Screens of glass greatly interrupt the passage of the latter, but do not sensibly intercept that of the sun. A plate of the most diaphanous ice totally intercepts terrestrial radiant caloric, but does not impede the sun's heating rays. This has, with considerable reason, been supposed to depend on the different velocities of the two species of calorific emanations. Sir John Leslie considered "that the phenomena of solar radiation proved *heat to be only light in a state of combination*." (*Essay*, 162.)

For thirty years after the publication of Leslie's *Experimental Inquiry*, little appears to have been attempted on this subject, until within a recent period, when the experimental researches of Melloni and of Nobili, particularly of the former, opened a beautiful field of investigation, which has already been cultivated with success by Professor James Forbes of Edinburgh. Melloni has, by means of a thermo-magnetic combination, invented a very delicate test of minute degrees of heat, wholly inappreciable by any thermometer, and has successfully applied it to investigate the laws of radiant heat. By uniting fifty small bars of antimony and bismuth into one bundle, about three fourths of an inch square, and about 1·17 inch in length, and connecting this with a galvanometer, he obtained an apparatus so sensible to heat, that the warmth radiating from the human hand, at the distance of several inches from the end of the bars, is indicated by the deviation of the needle of the galvanometer.



Melloni's instrument is represented in the adjoining figure, where a firm sole of wood is seen, provided with a groove, in which the different parts of the apparatus slide to adjust their relative distances. A is the bundle of metallic bars, enclosed in a square case of brass; B is the source of the heat; C, D are the wires proceeding from the bars, to convey their thermo-magnetism to the nearly neutralized needle or galvanometer, which is not here represented; G is the stage for occasionally supporting various substances, the effect of which on the calorific rays it is intended to ascertain; FF are screens of brass, moveable on joints, for cutting off at pleasure the radiant heat, or for obviating the influence of extraneous sources of heat. In F is a hole through which the heat radiates to A when the screen is removed.

This apparatus has been employed by Melloni to investigate the laws of radiant heat; and he has not only confirmed the general results of Leslie, but extended greatly our knowledge of this mysterious agent.

Melloni found, that the radiant and absorbent power of surfaces were not always proportional, as the following tables show.

The radiant power of surfaces of

Lamp black............= 100
Carbonate of lead......= 100
China ink...............= 85
Isinglass.................= 91
Lac.........................= 72
A metallic surface.....= 12

The absorbent power of surfaces of

Lamp black............= 100
Carbonate of lead......= 53
China ink...............= 96
Isinglass.................= 52
Lac.........................= 52
A metallic surface.....= 14

Melloni also found, that the absorbent powers of the surfaces varied considerably, according to the *source* of the radiation, and the *temperature* of that body. Thus, radiation from incandescent platinum wire, from copper at 400° and copper at 100° centigrade, gave the following results.

	Incand. Platinum.	Copper 400°	Copper 100°.
Lamp black....=	100	100	100
Carb. of lead...=	56	89	100
China ink......=	95	87	85
Isinglass........=	54	64	91
Lac...............=	47	70	72
Metal. surface =	13·5	13	13

This experiment proves,

1. That bodies do not always agree in their emitting and absorbent powers, though generally nearly so.
2. That their absorbent power varies very remarkably with the origin and intensity of the calorific rays.
3. That they approach each other more and more in their power of emitting and absorbing rays of heat, when the temperature approaches that of boiling water; and that, when exactly at that temperature, the emitting and absorbing powers coincide.

With respect to the *reflection* of radiant heat, he has shown, that it is equally reflected by metallic surfaces, from whatever source it emanates.

But Melloni's most original experiments are those on the transmission of radiant heat through various transparent media.

1. He showed that radiant heat is intercepted in a greater or less degree by all diaphanous bodies, in proportion to the *lowness* of the temperature of the radiating body.
2. That of two bodies unequally diaphanous, it may happen that the thickest and least diaphanous may transmit most radiant heat. Thus he showed that a thin plate of very transparent alum, placed on the stage G, transmitted four times less heat than a plate of almost opake quartz, about 100 times as thick; but he found that in the *same* substance the transmission of radiant heat is diminished by the thickness of the plate interposed, and this diminution is proportional to the lowness of the temperature of the radiant body.
3. That there are combinations of two media, which allow a notable quantity of light to pass, but totally intercept radiant heat; whilst others transmit heat, but wholly intercept light.
4. That in traversing a transparent plate, radiant heat undergoes certain modifications, variable with the nature of the plate; a change which renders it more or less susceptible ultimately of being transmitted through other diaphanous substances. Melloni instances this last property in glass, in crystallized citric acid, and in alum.

Delaroche had inferred, from his experiments, that it was a general law of radiant heat, that the permeability of plates to this agent depended upon the intensity of the source of the caloric; and in this way he explained the instant permeability of glass and ice to the calorific rays of the sun, whilst they retarded those from terrestrial sources of heat; but Melloni has discovered one substance which he found to be equally pervious to heat, from whatever terrestrial source, whether proceeding from the brightest flame, or from water far below the boiling point.

The power of penetrating glass and other media increasing in proportion as the radiating heat approaches the state of light, had been used by Delaroche as an argument for their identity; but the anomaly of rock-salt destroys the universality of the supposed law on which the argument is founded. Yet Mrs Somerville has ingeniously employed the unlooked-for analogy between light and heat, in the equal transmission of the latter, however eliminated, through rock-salt, as an argument for their being modifications of the same principle. The condition of visibility or invisibility, she contends, may depend on the construction of our eyes, not on the nature of the agent producing the sensations of vision and of heat.

"The sense of seeing, like that of hearing, may be confined within certain limits; the chemical rays beyond the violent end of the spectrum may be too rapid, or not sufficiently excursive in their vibrations to be visible to the human eye; and the calorific rays beyond the other end of the spectrum may not be sufficiently rapid, or too extensive, in their undulations, to affect our optic nerves, though both may be visible to certain animals or insects."

She has traced the analogies between light and heat in their reflection by polished surfaces, their refraction through transparent media, with their concentration by concave and dispersion by convex mirrors; and since the publication of her beautiful essay on the connection of the physical sciences, Professor J. D. Forbes has drawn the analogy closer, as we shall presently see.

But to return to Melloni. This able philosopher has shown that radiant caloric is susceptible of refraction; and when it arrives at the second surface of the refracting angle, with a certain obliquity, it is, like light, reflected toward the interior of the prism, and issues at the opposite face.

By interposing the same plate of glass, he ascertained the influence of transmission on the absolute power of different radiating surfaces thus:

	Before the interposition of the plate of glass.	After ditto.
Lamp-black.....................=	100	100
Carbonate of lead............=	53	24
China ink.......................=	96	100
Isinglass........................=	52	45
Lac...............................=	43	30
A metallic surface...........=	14	17

Melloni, however, failed to detect the polarisation of radiant heat: indeed, he states that the direction in

Diffusion of Heat.

which we slice crystallized bodies does not exert any influence upon the quantity of radiant heat immediately transmitted by them; and adds, that radiant heat is *not polarised* by transmission through tourmaline. In this, however, Melloni was deceived; and it was reserved for our countryman Professor Forbes of Edinburgh to complete the analogy between light and heat, by demonstrating the polarisation of the latter.

Since the characteristic phenomenon which marks the polarisation of light is its variable susceptibility as to reflection or transmission, under circumstances in which common light would be reflected or transmitted, it will appear that the correlative fact in the case of heat would be indicated by a diminished effect on the thermometer, where the intensity of light, under similar circumstances, would be a *minimum*, and *vice versa.* The importance of establishing this effect with regard to heat is far greater than the mere addition of such facts to our knowledge; for, as the corresponding facts in the instance of light have been completely brought into the domain of *analysis* by Fresnel, the polarisation of heat must be considered as almost decisive of its nature.

Mr Forbes employed Melloni's apparatus; and by interposing two plates of tourmaline, cut parallel to the axis of the crystal, and mounted on two slips of thin glass, he made a series of successive observations under the two conditions of the axes parallel and perpendicular to each other. Two measures of intensity in the position in which least light is transmitted were noted, and in the following table this position is indicated by *dark;* their mean is given, which is then compared with the intervening observation, in the position of greatest illumination, which is marked *light.*

The source of heat was a small oil lamp placed on the stage, six inches from the centre of the pile of Melloni's apparatus; the numbers indicate the degrees of the galvanometer.

Dark.	Mean.	Light.	Ratio.
4¼			
	4·5	5·2	86 : 100
4¾			
	5·0	6·0	83 : 100
5¼			
	5·2	6·0	86 : 100
5			
	5·4	6·5	83 : 100
5¾			

He afterwards obtained the polarisation of heat from various luminous and non-luminous sources, such as brass heated by a spirit lamp to 390° centigrade. The quantity of heat from different sources, polarised by the tourmalines, was as follows:—

With Argand lamp..............= 16 per cent.
...... Oil lamp....................= 11 do.
...... Incandescent platinum..= 12 do.
...... Brass at 390° cent.......= 3 do.

The most convenient way of polarising heat is by transmitting it through a bundle of extremely thin laminæ of mica, inclined to the incident ray at the polarising angle; mica having the property of transmitting heat very readily. The amount of polarisation is indicated by the relative quantities of heat reaching the pile, or thermo-magnetic combination of the instrument, through a second bundle of thin plates of mica, placed alternately in a parallel or perpendicular position to the first. With such an apparatus Mr Forbes demonstrated, in the most decisive manner, the polarisation of heat; and obtained this effect, even with water below 200° F. as the source of heat. The quantity polarised, however, always bears a proportion to the temperature of the source of the radiant heat, as is seen by the following tabular results.

General Effects of Caloric.

Sources of Heat.	Rays out of 100 polarised by the mica plates.
Argand lamp with a glass chimney	29
Oil lamp with a square wick	24
Alcohol lamp	36
Incandescent platinum	40
Brass heated to about 700° F.	22
Mercury in a crucible at about 500° F.	17
Water under 200° F.	6

Mr Forbes next proceeded to attempt the polarisation by *reflection;* and in this also he succeeded by the use of reflecting surfaces of mica, as in the corresponding case of light.

The success of these investigations, and the analogy of light, led him to the more delicate problem of the *depolarisation* of heat by plates of mica. By interposing a film of mica between the two bundles of mica plates already mentioned, having their planes of incidence at right angles to each other, and marking the difference of the heat transmitted to the galvanometer, when the principal section of the film of mica was parallel to the plane of primitive polarisation, or inclined to it at an angle of 45°, he succeeded in demonstrating the polarisation of the rays of heat, even when heat without light was employed. In these experiments, when the principal section coincided with the plane of polarisation, the depolarising effect was *nil;* but when it was inclined at the angle of 45°, he obtained the following proportions in one series of experiments.

100 : 118 — 100 : 120 — 100 : 120 — 100 : 113.

The depolarisation is still more marked with incandescent platinum; as the results were

100 : 126 — 100 : 138 — 100 : 138.

One of the most striking proofs of the depolarising power of mica is obtained, when the two bundles of mica plates are crossed, so as to intercept most heat, and we interpose a very thin plate or film of mica as above mentioned; then the galvanometer moves towards zero, or the thin plate evidently stops more heat than it depolarises; but if we substitute a much thicker plate of mica for the film, the instrument will indicate a higher temperature than when no mica at all is interposed, or the thick plate depolarises more heat than it intercepts.

These experiments were varied in a great variety of ways, so as to establish the fact of the depolarisation of heat; and if we admit that it depends on a similar cause to the analogous phenomena of light, it follows that the rays of caloric are susceptible also of *double refraction;* that the two pencils are polarised in opposite planes, and that they become capable of *interference* by the action of the analysing plate.

These curious facts would indicate at least a great similarity between light and heat; and the concluding observations of Professor Forbes's paper (*Edin. Phil. Trans.* xiii.) tend to confirm their identity.

SECT. III.—GENERAL EFFECTS OF CALORIC.

The general effects of heat applied to other matter are, expansion, fluidity, vaporization, and incandescence. The *most* general effect of heat, however, is,

1. *Expansion.*

When a body is heated, it expands in all its dimensions; but when the heat is withdrawn, the body returns to its original size. This is well shown by having a turned rod of metal, loosely fitted to a gage, to ascertain its length, and provided with a hole which first allows it, when cold, to pass through. This expansion is small in solids, but has been most accurately measured by philosophers, for

General Effects of Caloric.

the important purposes of ascertaining with precision the true length of the pendulum vibrating seconds in any latitude, and for obtaining a perfect standard of length. This difficult subject engaged the attention of Ellicot, Smeaton, Roy, Troughton, Lavoisier, and Laplace. The later experiments were made by the two last-mentioned philosophers, and were first published by Biot in the following table, which shows the expansion which different solids sustain, in passing from the freezing to the boiling point of water, in fractions of their own lengths.

Steel, not tempered	0·00107915	= $\frac{1}{927}$
Steel, tempered and annealed	0·00123956	= $\frac{1}{807}$
Silver, cupelled	0·00190974	= $\frac{1}{524}$
Silver of Parisian standard	0·00190868	= $\frac{1}{524}$
Copper	0·00171733	= $\frac{1}{582}$
Brass	0·00187821	= $\frac{1}{532}$
Tin of Malacca	0·00193765	= $\frac{1}{516}$
Tin of Cornwall	0·001217298	= $\frac{1}{462}$
Iron, forged	0·00122045	= $\frac{1}{819}$
Iron, wire-drawn	0.00123504	= $\frac{1}{812}$
Gold, pure	0·00146606	= $\frac{1}{682}$
Gold, standard, annealed	0·00151361	= $\frac{1}{661}$
Gold, standard, unannealed	0·00155155	= $\frac{1}{645}$
Platina	0·00085655	= $\frac{1}{1167}$
Lead	0·000284836	= $\frac{1}{351}$
Mercury, in volume	0·01847746	= $\frac{1}{54}$
Flint-glass, English	0·00081166	= $\frac{1}{1248}$
Glass, French, with lead	0·00087199	= $\frac{1}{1147}$
Glass tube, without lead	0·00089694	= $\frac{1}{1115}$
Plate glass	0·00089089	= $\frac{1}{1122}$

A very elaborate and interesting set of experiments on the expansion of building materials by heat, with a view to determine how far the changes produced by temperature may affect the stability of edifices into which these different materials enter, were since laid before the Royal Society, by Alexander J. Adie, Esq. civil engineer. He exposed square rods of these substances, twenty-three inches in length, and either half an inch or an inch in diameter, in a pyrometer of his own invention, to a heat of 212°. The increments in length were accurately determined by a microscope-micrometer, attached to the instrument; and the following table gives the increase of the whole length produced by 180° of heat, in decimals of an inch:—

	Decimals of an Inch.
Sandstone of Craigleith Quarry, Edinburgh	·0011743
Greenstone of Ratho, Edinburgh	·0008089
Arbroath paving flag	·0008985
Caithness paving flag	·0008947
Penrhyn slate	·0010376
Aberdeen gray granite	·00078943
Peterhead red granite	·0009583
Galway black marble	·00044519
Carrara white marble	·0011928
Best stock brick	·0005502
Cast iron, half inch square	·00114676

The expansion of solids at different temperatures appears to be nearly equable, as far as we can ascertain. The ratio of their expansion really *increases* with their temperature; but their whole expansion is so inconsiderable, that the increasing rate is inapplicable, except in the nicest investigations.

The expansion of liquids is much more considerable. In passing from the freezing to the boiling point of water, the expansion of several is as follows:

Mercury	0·00200	= $\frac{1}{50}$
Water	0·00456	= $\frac{1}{215}$
A saturated solution of common salt	0·00500	= $\frac{1}{20}$
Sulphuric acid	0·00600	= $\frac{1}{17}$
Muriatic acid	0·00600	= $\frac{1}{17}$
Oil of turpentine	0·00700	= $\frac{1}{14}$
Æther	0·00700	= $\frac{1}{14}$
Olive oil	0·00800	= $\frac{1}{12\cdot5}$
Nitric acid	0·1100	= $\frac{1}{9}$
Alcohol	0·1100	= $\frac{1}{9}$

General Effects of Caloric.

The inequality of the expansion of fluids by heat has long been known to form an obstacle to the accuracy of thermometers. Deluc found, that of all fluids mercury was the most equable in its expansions, which is probably owing to the great distance between its freezing and boiling points; for it is found that those liquids which have a low boiling point are the most irregular in their expansion at ordinary temperatures; and hence alcohol is not a suitable fluid for thermometers.

The expansibility of liquids is not in proportion to their density; but it is more nearly in the inverse ratio of their density than of any other known property.

The expansion of gases by heat is much more considerable than that of the other two forms of matter.

The higher increasing ratio in the expansibility of liquids with their augmenting temperature, than in solids, led philosophers at first to infer, that the inequalities of the gaseous bodies, in this respect, would be still more considerable; but the elaborate researches of General Roy have disproved this idea; and some experiments of the late Dr Murray of Edinburgh, and of Dr Dalton, would rather indicate a *decrease* in the ratio with the increased temperature. This, however, may probably be owing to the imperfection of our best thermometers, and to the difficulty of estimating the expansions of the glass containing the air examined.

Dr Dalton has ascertained that all gases expand equally by equal increments of heat; a conclusion which has been confirmed by Gay-Lussac. They have shown that, between the freezing and boiling point of water, 100 cubic inches of atmospheric air expand to 137·50, that with hydrogen the result was 137·52, with oxygen gas 137·48, and with nitrogen 137·49; differences so slight as to be within the probable limits of experimental error.

The force opposed to expansion would appear to be cohesion. Expansion is least in solids where the cohesion is strongest; it is more considerable in liquids where the cohesion is greatly weakened; and it is greatest in gases, in which cohesion is wholly overcome.

The expansion of bodies by heat, and their contraction on the reduction of the temperature, would show that the atoms of bodies are not in absolute contact. In fact, we may suppose them surrounded by *atmospheres of heat*, which prevent, by the repulsive energy of caloric, their absolute contact; whilst the force of cohesion limits the diffusive influence of the contained caloric. In some, the superior force of cohesion gives rise to solidity. When more heat is introduced, the cohesion is weakened, and the body becomes a liquid; and a further addition of caloric destroys cohesion altogether, separates the atoms, and the body becomes a gas.

The expansion of bodies by heat proves the mutual repulsion of their particles; but this limits the repulsive energy of heat to insensible distances. In 1824, Libri endeavoured to prove, from the movements of globules of water along fine wires, that the repulsive power of heat was exerted also at sensible distances. But his experiments are not conclusive; for the motions may have arisen from the formation of vapour at one end of the globule. Fresnel attempted to prove this point by bringing discs of foil or of mica, on the end of a delicately suspended magnet, into contact with fixed discs *in vacuo*, and marking the effect of heat collected from the sun's rays. The moveable discs sensibly receded; but this may have arisen from some change produced by the heat in the form of the discs. Professor Forbes has happily applied the repulsive energy of heat acting at *sensible distances*, to explain the curious vibrations of the metal bars in Trevelyan's experiments. Still more lately Professor Powell of Cambridge has demonstrated the repulsion of heat at sensible distances (*Phil. Trans.* for 1834), by the changes produced, on the approximation of a heated body, in the Newtonian coloured rings of plates of glass which are pressed together. When, for instance, a flat plate is laid on a slightly convex surface of glass, the rings appear. On bringing a heated body near the upper surface of the plates, the rings instantly contract, and again enlarge on withdrawing the heated body. On repeating the experiment with the colours formed under the base of a prism placed on a lens of small convexity, he found the repulsion of heat acting at distances, which Sir J. Herschel has calculated at $\frac{1}{1100}$th of an inch.

Expansion is so general an effect of heat, that there are only two known exceptions, viz. in clay, and in water at a certain limited range of temperature. It is well known that porcelain clay contracts in baking, and ever afterwards retains its contracted dimensions. It was this quality which induced Wedgwood to employ its contractions as a pyrometer. (See THERMOMETER and PYROMETER.) This property, however, seemingly depends on heat producing in the heterogeneous substance clay, a more intimate union of its parts, or a partial conversion of this mechanical mixture into a chemical compound.

The exception of water between 42° and 32° Fahrenheit, is, however, real. When water is cooled down from the ordinary temperature, say 60°, it regularly contracts by the cooling, until it has attained 42°; but whilst passing from that point down to its freezing point, it continues to expand gradually, until converted into ice.

The important purposes which this constitution of water serves in the economy of nature, the immense quantity of heat which is by this contrivance saved to our lakes and other collections of water, are strikingly pointed out by Count Rumford in his Essays; and this peculiarity in water has been confirmed by the well-devised experiments of Professor Hope and Dr Murray.

Many liquids at the moment of congelation *expand*, from the crystalline arrangement of their parts. This is familiarly known in the floating of ice in water, in the bursting of water pipes by frost, and in the splitting of masses of rock by the congelation of the water which has insinuated itself into their fissures. This force is well known to be enormous, as was shown by the experiments of the Florentine academicians, of Huygens, and of Major Williams at Quebec (see *Edin. Phil. Trans.*). The same cause produces the expansion of cast iron at the moment of becoming solid; and it is to this property that we are indebted for the sharpness of the casts obtained from this metal. In these instances we do not find an exception to the law of contraction by diminished heat. It is wholly owing to a crystalline arrangement of the particles, by which interstices are left between them, and consequently the solid occupies more space than if solidification took place without crystallization. Hence lead expands not in cooling, though cast iron does.

Many operations in the arts depend on the contraction of metals as they cool. It is in this way that the tyers of coach wheels are fitted tightly to the fellies. The expansion of metals by heat seemed at one time to form an insurmountable bar to the perfection of the going of a pendulum clock; but the ingenuity of an English artist showed how, by a combination of bars of metals of unequal expansibility, this property might be applied to keep the pendulum, at all temperatures, of precisely the same length. This first produced the gridiron pendulum; and more lately the compensation pendulum, with a mercurial cistern at the end of a metallic rod. Similar principles have been successfully applied to the balance-wheels of pocket chronometers.

2. *Liquefaction, or Fluidity.*

When solids are heated, they first expand, and then melt. This is a very general effect of caloric, the exceptions to which are disappearing, as we discover new sources of intense temperature. The oxyhydrogen blowpipe has fused almost all the more refractory substances; and the sun's rays collected by immense lenses, or metallic mirrors, have melted, or even dissipated in vapour, many bodies, which were long regarded as incapable of fusion. We are therefore entitled to regard solidity as the natural state of all matter, and its two other modifications as resulting from its union with caloric.

Those bodies always fused at the ordinary temperatures are no exception to this law, since, by artificial cold, we have reduced most of them to a solid state. Thus mercury, at about — 40° of Fahrenheit, becomes a solid metal with the lustre of silver; and alcohol, which has not yet been frozen, may be considered as having its melting point lower than any yet discovered artificial cold. The point at which bodies become fluid differs widely in different substances, but remains uniformly the same in the same fluid under similar circumstances. Thus ice always melts at 32°.

It was long believed, that when solids began to melt, they were converted into liquids by a small increase of heat; and that they might again return to the solid state by a small diminution of their temperature. An attentive consideration of the process of liquefaction convinced the celebrated Dr Joseph Black of the insufficiency of the commonly-received opinion; and he promulgated in 1757 more philosophic views of this subject, which he illustrated by a beautifully simple experiment.

He introduced equal quantities of water into two thin glass flasks of the same form and weight. One of them he froze, by placing it in a freezing mixture; the other he reduced by similar means to the temperature of 32°, or its freezing point, but without allowing it to become solid. When removed from the freezing mixture, the flask of ice soon acquired the same temperature as the ice-cold water, and both were suspended in a room at 47°. In half an hour the thermometer in the ice-cold water had risen to 40°, but it required twenty-one half-hours to raise the temperature of the flask which had been frozen to the same point. As both were exposed to the same medium, equal quantities of heat must have been imparted to each in equal times; but it required twenty-one times as long to raise the frozen flask 8°, as sufficed to impart 8° to the ice-cold water. Dr Black inquired what had become of this quantity of caloric, which was not indicated by any rise in the thermometer? He inferred that it had entered into the ice during its liquefaction; and as the quantity so absorbed was not indicated by the thermometer, he denominated it

Latent Heat.—In repeating the experiment with much care, he found that a pound of ice required twenty times as long to rise through 7°, as did as much ice-cold water; and therefore inferred, that during the conversion of that ice into water, as much heat disappears, or is absorbed, as would have elevated a pound of ice-cold water 140°. This absorption of heat during liquefaction is easily shown. If we add a pound of boiling water to a pound of ice, the temperature of the mixture will still remain at 32°; but if to a pound of water at 32°, we add a pound of boiling water at 212°, the temperature of the mixture will be found about 122°, or a mean between the extremes of temperature.

Similar absorptions of heat take place during the melting of tallow, bees-wax, and of the metals.

General Effects of Caloric.

When liquid bodies congeal, or become solid, their latent heat is again given out.

It is possible, by nice management, to cool down water considerably below its freezing point. The principal circumstance necessary for this experiment is to leave it at perfect rest, in an atmosphere from 10° to 15° below 32° (Dalton succeeded in this way in cooling water as low as 5° without freezing); but on slightly agitating it, the water suddenly freezes; and if a thermometer has been suspended in it, the instrument suddenly rises to 32°, owing to the conversion of latent into sensible heat.

Another experiment shows this fact in a striking point of view. Into a glass flask introduce a mixture of sulphate of soda and water, in such proportions that it will form a saturated solution about the point of ebullition. When this is heated to that point, pour a little oil on its surface, introduce a thermometer, and remove it from the fire. When quite cold, drop into it a small crystal of sulphate of soda, and the solution will speedily crystallize into a solid mass, during the formation of which the thermometer will be seen to rise, indicating the evolution of sensible heat, during the conversion of the liquid into a solid.

The absorption of sensible caloric on the liquefaction of bodies forms the basis of most of the processes by which we obtain artificial cold. When to some salts, such as sulphate of soda, we add nitrous acid diluted with an equal part of water, the salt rapidly melts, and the temperature is reduced to the beginning of Fahrenheit's scale. Diluted acid added to snow rapidly melts it, and the temperature is greatly reduced. A mixture of common salt and snow, which is the mixture generally employed to procure ice-cream, will sink the temperature to the beginning of Fahrenheit's scale. Dry muriate of lime added to dry snow will reduce the temperature, during their liquefaction, so low as to freeze mercury. In all these instances it is the absorption of heat caused by the liquefaction, or the conversion of sensible into latent caloric, that produces the cold.

Dr Black applied his theory of latent heat to explain many phenomena. The ductility of a body appears to be owing to the presence of latent caloric; for if we hammer a piece of iron smartly, it becomes intensely hot, by parting with its latent caloric, and at the same time has its ductility greatly impaired. This ductility is only restored by again heating the metal in the fire, by which it re-acquires latent heat, that may again be forced out by a repetition of the hammering.

The absorption of heat by bodies whilst melting is an important law in the economy of nature. Had it merely been necessary, for the immediate conversion of ice or snow into water, to raise the atmospheric temperature a few degrees, the sudden formation of water would have deluged the earth on every occurrence of a thaw. On the other hand, had the slightest lowering of the temperature of the air below 32° been all that was requisite to convert water into ice, the sudden expansion of the congealing juices of vegetables must have burst their sap-vessels, and rent asunder the strongest ornaments of the forest. But the law of the gradual absorption and emanation of caloric during these transitions from the solid to the liquid, and from the liquid to the solid state, produces those changes tranquilly and beneficially. The melting snow gradually augments the sources which fertilize the valleys; whilst the soil, loosened by the expansion produced by the previous frost, when softened by the succeeding thaw, is fitted for the reception of the roots of plants.

The influence of these processes on climate is not inconsiderable. The absorption of heat during the liquefaction of ice on tropical mountains, sends down into the heated valleys copious sources of cool water, which by its immediate contact, and still more by its evaporation, assuages the fervour of a broiling climate; and in high latitudes the caloric, eliminated on the freezing of water, tends to mitigate the rigours of an arctic winter

General Effects of Caloric.

3. *Vaporization.*

When liquids are heated, the first effect is expansion; but if the application of heat be continued, they assume the aeriform state, or pass into *vapour;* and when the caloric is abstracted, they again assume the liquid form. When water is heated to 212° Fahrenheit, it boils, and is converted into an invisible aeriform fluid, which remains perfectly transparent and colourless as long as its temperature is not below 212°; but what in common language is called steam, is this elastic fluid partially recondensed into water, by the loss of a portion of its heat. The invisible elastic vapour is capable of occupying space and expelling atmospheric air, as is shown by corking a flask when boiling, and opening it under water; when the flask will be suddenly entirely filled with the water, which condenses the steam.

Liquids, however, pass also into vapour by a more gradual process. If exposed to the air, water, for instance, gradually disappears; and if the process be carried on under a glass vessel, the included air becomes charged with moisture, which may be again abstracted from it by dry quicklime, or other substance having a strong affinity for water. The process by which liquids are thus converted into vapour is termed *Spontaneous Evaporation;* an important operation in nature, as on it depends the charging of the atmosphere with water, for the formation of clouds, mist, rain, and dew; all elastic fluids, however, are not capable of being condensed into liquids by any decrease of temperature we can command. Thus, no artificial cold has hitherto been discovered capable of converting atmospheric air into a liquid.

The common property of all aeriform fluids is *elasticity,* or the tendency, when forcibly compressed, to resume their former bulk. Thus, if we throw air, by means of a forcing pump, into an air-tight cistern, provided with a small orifice commanded by a stop-cock; on opening the latter, the air will issue out with great force, until the air has regained its former volume.

But vapours, or those aeriform bodies which are not permanently elastic, may, by strong pressure, even whilst their temperature is above their vaporific point, be condensed into liquids.

The elasticity of all aeriform bodies is increased by augmentation of temperature. In atmospheric air this increase has been found equal to $\frac{1}{480}$th of its volume for every 1° Fahrenheit; and the elasticity of steam, or the vapour of water, is nearly doubled by 30° of increased temperature above 212.

We are indebted to the celebrated Dr Dalton for accurate ideas as to the elasticity of aeriform bodies at different temperatures. He showed that the vapour of water, under a barometrical pressure of thirty inches at the boiling point, is just equal to the elasticity of atmospheric air under the same pressure; that the ratio of increase is rather less than a geometrical series, when the temperature is taken in an arithmetical progression; and, what was less obvious, that the elasticity of all vapours is precisely the same with the elasticity of the vapour of water, at the same number of degrees above the boiling point of each liquid. Thus water, under a mean barometrical pressure, boils at 212°; and the elasticity of its steam at 220°, or 8° above its boiling point, was found by Dalton to be = 34·99 inches: alcohol boils at 175°, and the elasticity of its vapour at 183°, or 8° above its boiling point, is just = 34·99.

The bulk of a body is very much increased by its conversion into vapour. Dr Black and Mr Watt made experiments to ascertain this increase. They boiled water in a flask, and, as the last drop was converted into steam, accurately closed the flask, which was then carefully weighed; on opening the flask below the surface of water, the quantity of water which rushed in was easily ascertained by a second weighing of the flask. The mean of several experiments showed that water, in the state of vapour, occupied 1800 times the space it filled as water. When heat is applied to solids, its first effect is expansion, next liquefaction, and, lastly, conversion into vapour. A few solids pass at once into the state of vapour, as carbonate of ammonia.

Different liquids acquire different degrees of heat for their vaporization. Thus æther becomes vapour at 104°, alcohol at 175°, water at 212°, and mercury requires a temperature about 692°. The vaporific point, however, remains constantly the same, in the same liquid, under the same barometric pressure. If, however, we diminish the pressure, the liquid will boil at a lower temperature. This is easily shown by the air-pump, in the exhausted receiver of which æther will boil at a temperature considerably below the freezing point of water. It is also strikingly exhibited by the following experiment: If a portion of water, say two ounces, be boiled in a flask capable of holding eight or ten, and if it be corked whilst briskly boiling, a vacuum will be formed on its surface, by the condensation of its vapour, on removing it from the lamp. As the steam condenses, the liquid in the flask will begin to boil more briskly as the flask cools; and if we pour *cold* water on this flask, the more will the pressure of the vapour in the flask be removed, and the more violently will the contained water boil. If now we pour *boiling* water on the flask, more steam will be formed, and the boiling will cease, but will be again renewed on a second application of the *cold* water. This may be alternated for several times if the flask be well corked.

As the boiling point of liquids varies exactly in the ratio of the barometrical pressure, it is obvious that the height of mountains may be ascertained by noting the thermometrical degree at which liquids boil on them. A portable instrument, constructed for this purpose, was devised by the Reverend F. Wollaston.

We cannot heat any liquid beyond its boiling point in an open vessel. Water placed on the fire soon rises to 212°, but a thermometer plunged in it remains at this point, however long it boils; but if the vessel be provided with a steam-tight cover, the temperature of the liquid may be much increased, according to the strength of the vessel. The elasticity of the steam in such cases is enormous; and experiments with steam under high pressure are hazardous, unless the vessel be of great thickness. The Marquis of Worcester seems to have burst a cannon by this means; and the frequent explosions of steam-engine boilers is a familiar instance of the same. Dr Black and Mr Watt heated water in a strong copper vessel to 400°; and in some of Perkins' experiments lead was melted, it is said, in water subjected to strong pressure; yet in an open vessel we cannot heat water to more than 212°.

Dr Black sagaciously and happily applied his doctrine of *latent heat* to explain the conversion of liquids into vapour. He remarked, that when a kettle was placed on the fire it soon rose to 212°; but though the same heat continued to be applied, it rose no higher. In one of his beautifully simple and conclusive experiments, a vessel containing some water, at temperature 50°, was placed on a red-hot iron plate; in four minutes it began to boil, but it required twenty minutes to convert the whole into vapour. In the first four minutes it had acquired an increase of 162° of temperature; and as the heat was uniform during the whole time of the experiment, it must have received an equal quantity of heat during the whole interval; or, during the other sixteen minutes, 810° must have flowed into it, yet during the whole time a thermometer in it rose no higher than 212°. Black naturally inferred that this large quantity of heat, which disappeared, had entered into the vapour in a *latent form.*

A series of experiments were undertaken by him, and by his friend Mr Watt, from which they inferred, that when water is converted into steam, it unites with 940° of heat, which the thermometer does not indicate; or, in Black's phraseology, that quantity becomes *latent* in the steam. This determination nearly coincides with the experiments of Lavoisier, who estimated the quantity which thus disappears at 1000° Fahr.

The absorption of heat during the formation of vapour is easily demonstrated. A piece of muslin moistened with any liquid, laid on the bulb of a thermometer, sinks the temperature; and if that liquid be very evaporable, the temperature thus produced will be low in proportion. The evaporation of æther will freeze water under the receiver of the air-pump; and the evaporation of the fluid called sulphuret of carbon is so rapid, that, in a well-exhausted receiver, it will freeze the mercury in the bulb of the thermometer.

A liquid may even, by particular management, be frozen by its own evaporation. This is the principle of Wollaston's philosophic toy, called the *cryophorus;* and it was ingeniously applied to an important practical purpose by the late Sir John Leslie, viz. the production of ice at a cheap rate in all climates. The apparatus employed by this philosopher is a powerful air-pump, which can at once exhaust from three to six flat receivers about twelve inches in diameter. These are fitted to different plates, each connected with the pump, and each provided with its own stop-cock. A shallow glass dish, nearly the width of the receiver, intended to hold a thin stratum of sulphuric acid, is introduced under each receiver, and a cup of porous earthenware, supported on a glass tripod about an inch above the surface of the acid, is under each receiver. Water is to be poured into this cup, which is to be placed on its tripod, and the whole covered by the receiver. By working the air-pump, each receiver may be exhausted in succession. The withdrawing of the atmospheric pressure causes the rapid evaporation of the water, the vapour of which is immediately absorbed by the sulphuric acid; and thus the vacuum is sustained. The latent heat necessary for the conversion of the water into steam or vapour is derived from the water itself; its temperature therefore falls; and the absorption of the vapour by the acid, as quickly as it is formed, keeps up the vacuum, and speedily reduces the whole water to the freezing point, when it soon forms a cake of ice. By a full-sized machine of this kind, about a quarter of an hour's labour will set the process in full operation; and within the period of an hour afterwards six pounds of solid ice may be obtained. During this process, the water loses only about one fiftieth of its bulk; and the acid will be sufficiently strong for repeated operations of the same kind.

Leslie showed, that any substance which is powerfully absorbent of watery vapour, may be substituted for the acid; and he found that highly toasted *oat meal,* or well-dried powder of *greenstone,* had very considerable power to produce ice, when employed instead of sulphuric acid. He even showed, that by enclosing a globule of mercury in a small pyriform mass of ice, suspended over the acid in a good vacuum, the mercury might easily be frozen.

The latent heat of steam may be shown by the large quantity of water which may be rapidly heated by a small

General Effects of Caloric.

quantity of steam. The elegant distillatory apparatus figured (No. 46) in Henry's Chemistry readily proves this. In an experiment with a similar apparatus, the condensation of one ounce of steam heated eight ounces of water from 60° to 180°; that is, the whole water gained 120° of temperature; consequently that ounce of steam had lost as much caloric as would have elevated an ounce of any fluid, capable of being so heated, to 960°.

The same phenomena attend the condensation of all other vapours; and we are to regard the discovery of Black, *that during the conversion of solids into liquids, or of liquids into vapours, heat is absorbed, which is again given out on their recondensation*, as a general law, and one of the highest importance, both in its practical application, and in explaining the phenomena of nature.

With regard to those aeriform bodies which we cannot condense, or, as they are called in chemical language, permanently elastic fluids or *gases*, we have every reason to consider them but as vapours, of which the point of generation is so low, that we have not yet found any means of exhibiting them in their unelastic state. This view is supported by analogy, and by recent discoveries. Some of the gases which a few years ago were reckoned permanently elastic, have been, by a great pressure, reduced to the state of liquids. This has been shown in the case of chlorine, muriatic acid, ammonia, and carbonic acid. It can also be shown that gases contain latent caloric. Thus, if we suddenly compress atmospheric air in a small tube fitted with a piston, so much heat is given out as to ignite touchwood. The sudden expansion of air, too, is always attended with the absorption of heat. Thus, on discharging an air-gun, the sudden expansion of the air produces a sensible degree of coolness in the condenser.

The same facts are shown when chemical action of the gases with each other produces condensation, or when they are evolved from their combinations.

The qualities of vapour are applied to many important purposes in the useful arts; and, on account of its economical fitness, the vapour of water, or *steam*, is that almost always employed.

The application of steam to domestic purposes is familiar to all; and it is frequently employed to communicate an equable heat, when a temperature above 212° would be injurious or dangerous. Thus steam, confined in metallic tubes, is used to dry some delicate articles of manufacture; and in some instances, where there is risk of explosion from even a moderate increase of temperature, the same contrivance is adopted. Steam has also been employed to warm apartments. It is employed to heat the dye-vats in calico-printing, and other species of dyeing, and has likewise been used for heating warm baths. For these last purposes, the steam is usually allowed to escape into the fluid to be heated by numerous small apertures in pipes coiled in the bottom of the vessel; which may thus be made of less costly materials than if it were necessary to subject it to the fire.

The most important application of steam, however, is as a moving power in the most stupendous of human inventions the *steam-engine*, the perfecting of which has conferred an enviable immortality on the name of WATT. The application of this noble discovery to the moving of machinery of every sort, from the ponderous hammers of the *forge* to the slender needles of the *tambouring frame*, to the drawing out and twisting the gossamer filaments of the cotton factory, to the weaving of cloth with a celerity that gives the process the air of enchantment, the winged velocity of the locomotive engine on the railway, and the stately mechanism which renders navigation independent of the winds, belongs to different branches of practical mechanics.

The conversion of liquids into vapour is the foundation of the important arts of *evaporation* and *distillation*. By the first we obtain salts from their solutions; by the latter, the spirituous or more volatile particles of compounds. See EVAPORATION and DISTILLATION.

Quantity of Heat in Bodies.

4. *Incandescence.*

When the temperature of a body is raised to a certain pitch, it begins to emit light as well as heat; and this is termed *incandescence*, or glowing heat; a designation preferable to *ignition*, which may be confounded with *combustion*; a process totally different from that treated of in this section, inasmuch as it is accompanied by important chemical changes in the body acted on; whereas incandescence may be repeated innumerable times with the same body, merely by raising its temperature. The point at which this takes place would seem to be the same in all bodies, and has been approximated by Newton; but as the determination depends on the acuteness of the eye, and the degree of obscurity in the apartment where the experiment is made, it is not easily fixed. According to his calculations, a good eye can perceive a body faintly luminous about 635° Fahrenheit; it shines with a full red in the dark about 752°, it is luminous in twilight at 884°, and glows in broad day-light when its temperature has reached 1000°. The experiments of Irvine, who found that mercury, which boils at 660°, is not in the slightest degree luminous at that point, prove that Newton fixed the point of incandescence too low. On the other hand, the determination of Wedgwood appears too high. In general the point of incandescence may be stated at about 800° Fahr. Its lowest pitch is at first a dull red, which becomes a full red with an increased temperature, or the least refrangible rays first meet the eye; if the heat be increased, these rays become mingled with the yellow; and, when the temperature is raised to the utmost, all the other rays of the spectrum are evolved in the proportions which constitute *white light*.

All solids which are not volatilized by heat may be rendered incandescent; and all liquids may be heated to redness, provided we can repress their volatility. But it has been doubted whether gases be capable of incandescence. Dr Fordyce had remarked that the extremity of the flame of a blowpipe, which was itself invisible, heated a thin rod of glass to a white heat; and some experiments of Mr T. Wedgwood prove that air, heated in a bent tube passing through a crucible filled with red-hot sand, was not luminous, although a gold wire suspended in the heated air became red. The speculations of Sir Humphry Davy on flame show that his opinion inclined to consider flame as luminous gases; but in all such cases there is reason to consider the light as derived from the combustible. Incandescence can be excited by the mere percussion of hard bodies against each other. Thus, two pieces of quartz struck together will produce light; the same will take place with two fragments of porcelain; and the light produced by the collision of flint and steel is partly incandescence, partly a species of combustion of the steel.

It has been supposed that incandescence affords a probable evidence of the identity or convertibility of heat into light. But this is not a legitimate deduction; for we may conceive that light and heat, though two distinct fluids, may have an intimate affinity for each other, or a tendency to unite, that both may exist united in all matter, that heat is most easily separated by percussion and friction, but that, when the percussion is violent, both are given out.

SECT. IV.—QUANTITY OF HEAT IN BODIES.

Equal weights of the same body, at the same temperature, contain equal quantities of heat; and when their tem-

Quantity of Heat in Bodies.

peratures are unequal, their heat is in proportion to their temperature. But it is very different with dissimilar bodies, which can be shown to contain unequal quantities of heat at the same temperature. The following is the method of proving these positions. If we mix a pound of water at 40° with a pound of water at 112°, the resultant is 76°, the mean between the extremes of temperature.

But if we mingle a pound of water at temperature 112° with a pound of mercury at 40°, the resultant temperature will not be 76°, the mean, but 109°. Here the temperature of the water has only been diminished 3°, yet that of the mercury has risen 69°. If we reverse the experiment, and take water at 40° and mercury at 112°, the product will be 43°; the mercury losing 69°, whilst the water only acquires 3°; or the same quantity of heat which can elevate the temperature of mercury 23° will only augment that of water 1°. If a similar experiment be made with spermaceti oil, Dr Thomson has shown (*System of Chemistry*) that the quantity of caloric which will elevate the temperature of the oil 2° can only raise that of water 1°.

Dr Black was undoubtedly the first who promulgated the idea of the absorption of heat during liquefaction and the formation of vapour; and this doctrine was publicly taught in his lectures in Glasgow university from 1757 to 1764. His pupil, Dr Irvine, continued these experiments at his suggestion, and ascribed the absorption to a change in the *capacity for heat*. These experiments were made between 1765 and 1770; and in 1779 Dr Adair Crawford published his treatise on *Animal Heat*, in which the capacities of numerous substances are given, which were corrected in his edition of 1788, from the results of most elaborate experiments. Professor Wilcke of Stockholm published some valuable experiments on the same subject, in the Stockholm Transactions for 1781. This philosopher introduced the term *specific heat* for what Irvine named *capacity for heat*. Various experiments on the same subject were made by Lavoisier and Laplace, with the instrument called a *calorimeter*, in which the specific caloric was estimated by the quantity of snow melted by different substances heated to the same pitch. The subject of experiment in their investigations was introduced into a wire cage suspended within a vessel of tinned iron. This vessel was filled with snow or ice; and to secure that snow from being melted by the external air, the vessel containing it was placed within another exterior case, and the space between them also filled with snow; and the whole covered by a lid, likewise covered with snow. Thus, if water in passing from 212° to 32° melted one pound of ice, and the same weight of oil melted a half pound; if the specific caloric of water be termed 1·0, that of oil will be 0·5.

A considerable series of experiments on this curious subject were made by Dr Dalton (*New System of Chemical Philosophy*). In these investigations Dalton pursued a method, also employed by Leslie, namely, to observe the comparative rates of cooling, as was proposed by Meyer. This would be preferable to the other modes of ascertaining the specific caloric, were we sure that the cooling of bodies is not influenced by other circumstances than their capacity; but in this method it is difficult to obviate the effects of radiation and conducting power on refrigeration. In all these determinations there are to be found discrepancies inseparable from the difficulties attending such delicate investigations; but they have sufficient accordance when we attempt to estimate the capacities of solids and of liquids. It is a far more difficult and delicate problem to determine the specific caloric of gaseous bodies, from the minute quantities of matter to be operated on in such experiments, and the difficulty of obviating the chance of accidental error where the changes of temperature are necessarily very minute. Crawford found the difference in the specific heat of the gases rarely to exceed $\frac{1}{10}$th of a degree of Fahrenheit. He employed two equal hollow spheres of brass, united by a bar of the same metal, and furnished with stop-cocks, and an adapting piece, to be screwed to an air-pump. One of these was filled with the gas to be tried, and the other was exhausted of air. Each ball had cemented into it a very delicate thermometer; both were heated to the same pitch by exposure to the same source of heat, conveyed by cylinders surrounded with warm water. They were then simultaneously plunged into separate vessels containing each equal quantities of cold water, and the elevation of temperature of the water in both vessels ascertained by delicate thermometers, indicating as small a change as $\frac{1}{30}$th of a degree of Fahrenheit. The temperature communicated by the vacuum being subtracted from that given out by the other ball, the difference exhibited the heat communicated by the included air alone; and the accuracy of the method was afterwards tested by again comparing them when the exhausted vessel was filled with atmospheric air.

The specific caloric of gases has been again investigated by Berard and Delaroche in 1813. They passed a current of each gas, at a given temperature, through a spiral tube, fixed in a cylinder of thin copper filled with water and then closed. The temperature communicated, by the passage of the gases from a gasometer through the spiral, to the surrounding medium in a given time, being proportional to the excess of temperature each gas acquires from the source of heat above that of the medium in the cylinder, the comparative specific heat of each gas may be ascertained.

For the success of such experiments the current of gas must be uniform, and the temperature of the gas, when entering and escaping from the cylinder, must be accurately ascertained, as well as that of the water in the copper vessel.

The conclusions of these philosophers are directly at variance with those of Crawford, and, indeed, would tend to overturn some of the most important points of the philosophy of heat now generally received. But these experiments, though highly ingenious, are not more satisfactory than those of Crawford. The only objection to his conclusions is derived from the smallness of the quantities operated upon in his experiments; but the simplicity of his apparatus, the delicacy of his instruments, and the apparent care of his manipulations, more than fully counterbalance that objection; whilst the complexity of the apparatus of Berard and Delaroche, the acknowledged difficulty of keeping up an equable current through the spiral tube, the impossibility of obviating in such investigations the influence of changes in the medium during the experiments, and the nicety requisite to ascertain the temperature of the entering and escaping currents, present sources of error of which it is almost impossible to estimate the amount. On these grounds we may consider the conclusions of Crawford as not yet overturned.

The deductions of these gentlemen would lead to the conclusion that all the gases, with the exception of hydrogen, have an inferior specific heat to water; and they even make steam *inferior* in capacity to water in the ratio of 847 to 1000. If this last were true, instead of an absorption of heat when steam is generated, we should have an extrication of caloric from it; and water in the *worm-tub* of a still, or in the *condensing-back* of a steam-engine, ought not to increase in temperature. It may be added, that more recently the conclusions of Berard and Delaroche have been controverted by Delarive; and his experiments, as well as those of Clement, support the opinions of Crawford.

Mr Haycraft (in a paper in *Trans. Royal Soc. Edin.* x.)

has endeavoured to show that all gases at the same temperature, when perfectly freed from moisture, have the same specific heat; and that when they are saturated with water, their specific caloric is a certain ascending arithmetical ratio, in proportion to the quantity of moisture they contain. These views are rendered not improbable by the well-ascertained fact, that the elasticities of all the gases are the same at the same temperature.

The capacities of bodies are more nearly in the inverse ratio of their density, than of any other sensible property. Thus solids in general have less capacity for caloric than liquids, and liquids less than vapours or gaseous bodies. In the same body a change of capacity accompanies a change of volume. Thus gases compressed have their capacity diminished, and heat is extricated; and when they expand, their capacity is increased, which is the cause of the coldness felt on a sudden expansion of the air. Crawford endeavoured to show that this was also the case with liquids; but his experiments are scarcely to be relied on as establishing that point. The contraction of Wedgwood's pyrometrical pieces would seem to diminish sensibly their capacity for heat. The capacity of bodies is not, however, exactly in the inverse ratio of their density, which probably arises from the effect of density on capacity for heat being modified by a difference in the force of affinity between caloric and various substances. There seems also to be some relation between capacity and power for conducting heat, as the former is nearly in the inverse ratio of the latter. If these views be correct, we may assume that the capacity of all bodies for caloric is directly as their volume and their affinity for heat, and inversely as their conducting power and their density.

When a body changes its form of existence, its capacity for heat is also changed. When a solid is melted, its capacity is increased, and the specific heat of the same substance is still further increased when it is converted into vapour. Thus, according to the best experiments, the capacity of ice is 0·9000, that of water being 1·000, and that of steam 1·500.

This important law was applied by Dr Irvine to explain the liquefaction of solids. Dr Black regarded the liquefaction as owing to the absorption of heat; Dr Irvine ascribed this absorption to a change in the capacity of the body. The first ascribed the melting of the solid to the absorption of the heat, whilst the other attributed the absorption to the change of form. As the change of form and the absorption or extrication of caloric are in such cases simultaneous, it is obvious that the question cannot be decided by direct experiment. It has been objected to Irvine's theory that it assigns no cause for the change of form, whilst Black's ascribes the change to the ingress of caloric. On the other hand, Black's theory does not explain why the heat is absorbed. When we heat a solid, the first effect is expansion, and this expansion keeping pace with the increasing temperature, a point will be attained when the expansion has so far overcome the cohesion of the solid that its particles move freely among each other, that is, when the body will become liquid. Thus far the change may be attributed to sensible heat; but the capacity of the body for heat has all the time been increasing, and, to satisfy this increased capacity, sensible heat has become latent. This appears the simplest view of the subject, ascribing the change of capacity to the expansion by the sensible heat; and the difference between the solid and fluid states may be conceived to depend on the prevalence of one of two opposing forms, the cohesive attraction of the particles of matter for each other, and the repulsive energy of caloric.

Dr Black has supposed that latent heat is retained in bodies by an affinity superior to that between sensible caloric and the particles of matter, and liquefaction is ascribed to this more intimate union. This opinion is scarcely perhaps reconcilable with the immediate effect of mixing ice cooled to 20° and water a little above the freezing point, when the water parts with its latent heat to raise the temperature of the ice; or with the effect of mechanical pressure in causing gases to part with their latent caloric.

Absolute Quantity of Heat in Bodies.

It will be sufficiently obvious, that neither by the thermometer nor by the capacity of bodies do we determine the whole heat which they contain at any temperature. The first is evidently nothing more than an indication of changes in a scale, of which the two extremes are unknown; the last mode affords us but the relative quantity of caloric required to elevate the temperature of other bodies compared to water, but it does not point out how many degrees any given temperature is above that point at which a body is deprived of all its heat. Irvine appears to have first conceived the idea of ascertaining by calculation the absolute zero, or deprivation of all heat, on the supposition that the whole heat in any body is proportional to its capacity. If this be granted, the whole caloric it contains at a given temperature may be found by ascertaining the quantity of heat it absorbs when passing from the solid to the liquid state. Thus ice has the capacity of 9 to water as 10, and, when both are at temperature 32°, water will contain one tenth more heat than the same weight of ice; but this excess is given out when water freezes, and as much is again absorbed when it melts. According to Black's experiment, ice absorbs as much caloric, whilst passing into water, as would elevate an equal quantity of ice-cold water 140° Fahrenheit. Therefore 10 × 140 = 1400°, will give the *natural zero*, or the point of the absolute deprivation of heat. Almost the same result is obtained by comparing the capacity of steam and water, viz. 1·0 and 1·5. Water, in passing into steam, absorbs 940° of sensible heat, and 940 × 1·5 = 1410.

The following general formula, as applicable to this investigation, is given by Professor Robison in his notes on Black's Lectures. Let the capacity of water be 1. Let the quantity of water be W, and its temperature be *w*. Let the quantity of the body whose capacity is tried be B, and its temperature be *b*, and the temperature after mixture be *m*. Then the

capacity of B $= \frac{W \times \overline{m - w}}{B \times \overline{m - b}}$. Or if the water be the hottest of the two bodies mixed, the formula is

$$B = \frac{W \times \overline{w - m}}{B \times \overline{m - b}}.$$

The accuracy of this conclusion, however, depends on three points: first, the perfect determination of the specific heat of water, and of its two other forms of existence, to which it is probably impossible to obtain any more than an approximation; secondly, on the assumption that the whole heat of bodies is retained in them by their capacity; and, lastly, on the supposition that while the body retains its form of existence, its capacity remains unchanged. Until these points be established, the theory is but an amusing speculation, in which the estimates of other philosophers do not materially differ from those of Irvine. Rumford, from experiments on the heat extricated by the combination of hydrogen and oxygen, placed the natural zero at 1552° Fahrenheit below the freezing point; Gadolin, from the cold produced by dissolving muriate of soda in water, inferred it to be at — 1432°.

Variations of Temperature.

SECT. V.—VARIATIONS OF TEMPERATURE.

1. *Artificial Means of Increasing Temperature.*

Caloric may be excited by the sun's rays collected by a lens or by a concave mirror, by friction and percussion, and by chemical action.

1. When we collect the sun's rays by a lens, it is well known that combustibles may thus be fired; and if the lens be large, it produces the most intense temperature we can command. In the focus of the powerful lens made in London for Mr Parker (which measured three feet in diameter, three inches thick at the centre, and weighed 212 lbs.), the most infusible metals were instantly melted and dissipated in vapour, and most stony substances were vitrified. Another, constructed at Paris, is described in the *Memoires* of the French academy. Lenses of great power have been also made of two curved plates of glass joined together, and filled with spirit of wine. A remarkable lens of this sort, formed by bending two plates of glass on a parabolic mold, and filling the cavity between them with ninety quarts of spirit, was constructed by Rossini of Gratz, in Styria. The diameter of the plates was 3 feet 3 inches, and they were united by a strong ring of metal. The whole was mounted on a heliostat, which, with the lens complete, weighed 550 lbs. This fine instrument cost about L.1000, but became, a few years ago, the property of the French government for L.338. In its focus a diamond was instantly kindled and dissipated; and a piece of platinum, twenty-nine grains in weight, was melted and thrown into violent ebullition.

Concave metallic mirrors are capable also of concentrating the sun's rays, so as to produce a powerful heat. Mirrors of hammered brass, or tinned iron, are used for experiments on the radiation of heat. It was by some combination of mirrors that Archimedes is said to have fired the Roman fleet at the siege of Syracuse; and Kircher, having found a description in Tzetzes, of the device of Archimedes, from which it would seem that the mirrors were placed on *hinges*, in order to adjust them to a focus, constructed a compound burning mirror of this kind possessing considerable power; but Buffon, by combining as many as 168 plane glass mirrors, six inches broad, showed that silver might be fused at the distance of sixty feet by such an instrument.

2. The capability of friction between two solids to excite heat is well known. In Rumford's experiments water was made to boil by the friction in boring a cannon; and the simple experiment of rubbing a smooth metallic button on a board, by which much heat is produced, is familiar to every school-boy. The firing of carriage-wheels, and of different kinds of machinery, whose parts, moving against each other, are not well oiled, is well known. This extrication of heat takes place *in vacuo* as well as in the air, and appears to be owing to the compression employed forcing the particles of the solid more closely together, and extricating their latent caloric. Berthollet showed that this extrication of caloric is not unlimited, as Rumford erroneously supposed; but that, if we repeatedly compress any body, the quantity of heat extricated rapidly diminishes by each application of the compressing force.

Percussion acts in precisely the same manner. A piece of iron, by smart hammering on an anvil, may become so hot as to fire combustibles. This process evidently diminishes the capacity of the iron for heat, its specific gravity becomes greater, and the loss of its latent heat renders it stiff and brittle. A similar change takes place in *wire-drawing* metals; so that, to restore pliability and ductility, we must subject them to the fire, which restores their latent heat, and renders them again ductile.

3. Chemical action is a fruitful source of increase of temperature. If we mingle together equal parts of sulphuric acid and water, or of alcohol and of water, the bulk of the mixture diminishes, and heat is given out. The temperature produced by chemical action will often ignite inflammables. Thus a drop of sulphuric acid on a mixture of chlorate of potassa and sugar will set the mixture on fire. Indeed, the process of combustion, the great source of artificial heat, is nothing more than the chemical union of the oxygen of the air with the combustible body. The source of the temperature is the liberation of the latent heat of the oxygen, on its entering into union with the carbonaceous matter of the fuel; and the increase of the temperature is in proportion to the air consumed in a given time. If we wish a higher temperature, we increase the quantity of air that passes through the fuel; hence the utility of bellows, and of the blowpipe, in exciting a higher temperature than the spontaneous combustion of the burning body would afford. See FURNACE.

Variations of Temperature.

2. *Artificial Means of Diminishing Temperature.*

There are three methods by which we can cool bodies; by placing them in contact with colder substances, by the evaporation of liquids, and by the liquefaction of solids.

1. The first method is very familiar, and depends on the tendency of caloric to an *equilibrium* in contiguous bodies.

2. The conversion of a body into vapour causes, by the increase of its capacity for heat, an absorption of caloric. Thus the evaporation of water from the ball of a thermometer causes the mercury to fall. If we apply a still more evaporable fluid, ether, the fall of the thermometer will be still lower; and, if we accelerate this process by an air-pump, the cold produced will be intense; the degree of the absorption of heat, or, in other words, the production of cold, being in proportion to the quickness of the evaporation.

3. The most powerful means of reducing temperature is by what are termed *freezing mixtures*. All these depend on the rapid melting of solids by the addition of various substances. Many experiments have been made on this subject by Lowitz of Petersburg, and by Mr Walker of Cambridge. Salts are the solids most commonly used, and they are in general either mixed with snow or with acids. Thus, if we mix common salt and snow together, the temperature falls to 0° of Fahrenheit. If we pour two ounces of nitric acid diluted with an equal quantity of water on three ounces of sulphate of soda, the temperature sinks below the beginning of Fahrenheit's scale. Equal parts of strong muriatic acid and of snow will produce a cold of -30° Fahrenheit; and the same proportions of diluted sulphuric acid and snow, if previously cooled down to 20°, will cause the freezing of mercury, reducing the temperature to -60°. Dry muriate of lime and dry powdery snow, in the proportions of two of the former to one of the latter, if previously cooled by immersion in salt and snow, will sink the temperature to -66°; and three parts of muriate of lime and two of snow, similarly treated, will reduce the temperature to -73°.

In all these experiments, it is the sudden conversion of sensible into latent heat that lowers the temperature of the mixtures; the substances assume the liquid form, their capacity for heat is increased, and the disappearance of the sensible heat is manifested by the sinking of the thermometer.

For the natural variations of temperature and their causes, see CLIMATE, and PHYSICAL GEOGRAPHY.

For various important facts and observations on heat, see Black's *Lectures on Chemistry*, vol. i.; Murray's *System of Chemistry*, vol. i.; Dalton's *Chemistry*; Leslie *on Heat*; Pictet *Sur le Feu*; Rumford's *Essays*; Deluc *Sur les Modifications de l'Atmosphère*; Saussure *Sur l'Hygrométrie*; Young's *Lectures on Philosophy*; Biot, *Traité de Physique*, i.; Martine *on Heat*; Crawford *on Heat*; Irvine's *Essays*; J. and G. Murray's *Popular View of Chemistry*; Mrs Somerville's *Connection of the Physical Sciences*; *Phil. Trans.*, 1754, 1777, 1783, 1788, 1792, 1795, 1799, 1800, and 1801; *Edin. Phil. Trans.*, vi., ix., x., xii., xiii.; *Ann. de Chim.*, 3, 14, 22, 29, 71, and 75; Nicholson's *Journal*, 4, 9, 11, and 12, 8vo series; *Journ. de Physique*, 61; *Ann. of Phil.*, 2, &c.; *Manchester Memoirs*; *Mémoires de l'Académie de Genève*, &c.

The theory of heat which ascribes this agent to motion among the particles of matter, and which has been distinguished by the name of *The Mechanical* or *Dynamic Theory of Heat*, was adopted by Count Rumford in 1778, and by Sir Humphrey Davy in 1799. Since that period it has been very ingeniously maintained by Mayer, in Liebig's and Wöhler's *Annalen* for 1842; by Mr Joule, before the British Association in 1843; by Mr John Macquorn Rankine; and by Professor William Thomson of Glasgow, in the *Edinburgh Philosophical Transactions.*

The principal fact on which Rumford founded his views is the high temperature exerted by friction in the boring of cannon; Davy adduced his experiment of the melting of two cakes of ice when rubbed together *in vacuo;* Mayer adduces the rise of 1° of the thermometer by the agitation of water in support of his views; Joule draws his conclusion from the heat produced by the friction of water running through a pipe, which he estimates at 1° for every pound of water moving with a force equal to raise a weight of 770 lbs. one foot.

Other arguments have been drawn from the still obscurely understood heating effects of magnetic electricity, and the analogies between radiant heat and light; to which last the undulatory hypothesis has been ingeniously applied. The views are specious, and by some are considered as satisfactory; so as to have converted the celebrated Melloni to the undulatory theory, which considers light and radiant heat as differing only in the length of their undulations. (T. S. T.)

HEATH. See BOTANY; nat. ord. *Ericaceæ.*

HEATHFIELD, LORD. See ELLIOT.

HEBE, in *Grecian Mythology*, the goddess of youth, and cup-bearer of the gods. She was the daughter of Jupiter and Juno, and is sometimes depicted assisting her mother in yoking her horses to her chariot. In her function of pouring out the nectar at the feasts of the gods, she was superseded by Ganymede; but she always retained her power of restoring the aged to the bloom and vigour of youth. In Rome she was worshipped under the name of Juventas, and a temple in her honour existed on the Capitoline Hill as early as the time of Servius Tullius.

HEBER, REGINALD, bishop of Calcutta, was born April 21, 1783, at Malpas in Cheshire. He was sent to the grammar-school of Whitchurch at the age of eight, and entered Brazen-nose College, Oxford, at the age of seventeen. In his first year there (anno 1800) his *Carmen Seculare* gained the prize for Latin verse, as did his *Palestine* in 1803 for English verse. In 1804—the year of his father's death—he was elected fellow of All Souls' College. In the following year he began his travels in Europe, visiting Sweden, Norway, Russia, and the Crimea. After an absence of more than a twelvemonth, he returned through Austria and Germany to England. Soon after he took the degree of M.A. he married Amelia, daughter of William Shipley, dean of St Asaph, and settled on the living of Hodnet in Shropshire. In 1812 he began a Dictionary of the Bible, and published a volume of poems. In 1815 he was appointed to deliver the Bampton lecture on "The Personality and Office of the Christian Comforter." In 1822 he was elected preacher at Lincoln's Inn. On the 16th June 1823, after having been made D.D. of Oxford by diploma, he sailed with his family for India, having been appointed to succeed Bishop Middleton at Calcutta. He landed at Calcutta on the 10th of October, and shortly afterwards consecrated the church of St Stephen at Dumdum. His first visitation in the cathedral at Calcutta was held on Ascension Day 1824. In May 1825 he held a visitation at Bombay. At Trichinopoly, on the 3d April 1826, he was found dead in his bath before breakfast, having been suddenly cut off by an apoplectic fit at the age of forty-three.

Bishop Heber gave early indication of that love for the classics, in the study of which he afterwards gained such high honours at college; for at the age of seven he had translated *Phædrus* into English verse. With a natural thirst for knowledge, a strong memory to retain what he once learned, and a glowing fancy, he possessed also the application necessary to develop these faculties into important results. Not possessing originality in the same degree, the classics became his model. For the exact sciences he had not the same relish. Logic, at least as unfolded by Aldrich, he even disliked. He had a taste for drawing and natural history. During his European travels he kept a copious journal of what he saw and read. Hence his voluminous correspondence with his friends contains the results of his close observations of the manners, customs, and superstitions of the people through whose countries he passed. He wrote a history of the Cossacks, contributed to the *Quarterly Review*, and published a complete edition of Jeremy Taylor's works, with a life and criticism. As an author he is most popularly known for his hymns and sacred pieces. These breathe a strain of the most exalted piety and Christian fervour; and in this accurately reflect himself.

But it is as the Christian pastor of Hodnet, and the apostolic Bishop of Calcutta, that Heber is specially entitled to our regard. From a very early age his mind was imbued with feelings of the deepest reverence for God. Prayer and reading of the Scriptures were attended to by him with exemplary regularity during the absorbing period of college life. When he returned from his travels in Europe, after his unusually brilliant career at Oxford, the path to literary fame was open to him, yet he preferred devoting himself to the humbler duties which devolve on the pastor of a parish. When disease was spreading through the district, Heber was still to be found at his post, visiting the sick, comforting the afflicted, relieving the distressed, and making known to all the way of salvation through Jesus Christ. An amiable temper, conciliatory manner, a benevolent heart, and a sound head, accompanied by such faithful discharge of duty, endeared him to all his parishioners.

Modest as he was, it is not remarkable that when he was offered the vacant bishopric of Calcutta his diffidence led him twice to refuse such a responsible charge. When, however, he did enter upon its duties, his whole energies were directed to the great work of evangelizing India. He travelled extensively, planting churches and encouraging the missionaries. Of his route through the upper provinces, between Calcutta and Bombay, a narrative was published in 2 vols. 4to. He also visited the Deccan, Ceylon, and Madras, carrying out with characteristic zeal the great object of his mission.

HEBERDEN, WILLIAM, a practical physician of great celebrity, was born in London in the year 1710. He was sent at a very early age, near the end of 1724, to St John's College, Cambridge. He took his first degree in 1728, and obtained a fellowship about 1730; he became master of arts in 1732, and took his degree in physic in 1739. He remained at Cambridge about ten years longer as a practitioner of physic, and gave an annual course of lectures on the Materia Medica. In 1746 he became a fellow of the Royal College of Physicians in London; and two years afterwards he left Cambridge, having presented to St John's College the specimens which had been subservient to his lectures. He also added to this donation, a few years afterwards, a collection of astronomical instruments of some value. Having determined to establish himself in London, he was elected a fellow of the Royal Society in 1769; and was employed in a very extensive medical practice for more than thirty years. When he became sensible that his age required some indulgence, he resolved to pass his summers at a house which he had taken at Windsor; but he continued his practice in the winter for some years longer. In January 1760 he married Mary, daughter of W. Wollaston, Esq., by whom he had five sons and three daughters; but he survived them all, except Dr W. Heberden, and Mary, married to the Rev. G. Jenyns. In 1778 he was made an honorary member of the Royal Society of Medicine at Paris.

Dr Heberden's first publication seems to have been a short essay on the incongruous composition of the mithridate and theriac, entitled *Antitheriaca*, 8vo, 1745. 2. He sent to the Royal Society an Account of a very large Human Calculus, weighing more than 2¼ lbs. avoirdupois (*Phil. Trans.* xlvi., 1750, p. 596; *Abr.* xi., p. 1005). 3. Account of the Effect of Lightning at South Weald, in Essex (*Phil. Trans.* liv., 1764, p. 198). Both these essays are erroneously attributed, in Dr Maty's index, to his brother, Dr Thomas Heberden of Madeira, who sent several other papers to the society. Dr Heberden was one of the principal contributors to the first three volumes of the *Medical Transactions*, published in a great measure at his suggestion, by the College of Physicians, in which we find about sixteen of his original communications. 4. Remarks on the Pump Water of London, 1768. 5. Observations on Ascarides. 6. On Night Blindness, or Nyctalopia. 7. On the Chicken-Pox. 8. On the Epidemical Cold of 1767. 9. Queries relating to bark, camphor, cold, the gout, and apoplexy. 10. On Hectic Fever. 11. On the Pulse. 12. On a Disorder of the Breast, the *angina pectoris*. 13. On Diseases of the Liver. 14. On the Nettle Rash. 15. On Noxious Fungi. 16. Queries on sizy blood, on hernia, on damp clothes, on venesection in hemorrhages. 17. On an Angina Pectoris. 18. On the Ginseng. 19. On the Measles. 20. Table of the Mean Heat of the different Months in London (*Phil. Trans.* lxxviii., 1778, p. 86). 21. *Commentarii de Morborum Historia et Curatione*, London, 1802, in 8vo; also in English. He had long been in the habit of making notes in a pocket-book, at the bedsides of his patients; and every month he used to select and copy out, under the proper titles of the diseases, whatever he thought particularly worthy to be recorded. In the year 1782 he employed himself in digesting this register into the form of a volume of *Commentaries* on the history and cure of diseases, religiously observing never to depend on his memory for any material circumstance that he did not find expressly written down in his notes. These Commentaries were intrusted to the care of his son, Dr W. Heberden, to be published after his death. We find in them a greater mass of valuable matter, accurately observed and candidly related, than in almost any other volume which has ever appeared upon a medical subject; yet they are but too likely to chill the ingenuous ardour of many a youthful mind, and even to lead to a total apathy with respect to the diligent study of a profession in which so respectable a veteran was so often disposed to exclaim that "all is vanity." There are, indeed, many instances in which he does not seem to have been perfectly master of all the instruments of his art: thus, he appears to have been but partially acquainted with the virtues and various uses of antimony and ipecacuan, and to have reasoned very inaccurately on the operation for a strangulated hernia. But it has been remarked, that the more experience a physician acquires in his profession, the more he is in general inclined to approach the opinions of Dr Heberden, and to esteem his writings.

Notwithstanding that he has been accused of having occasionally been liable to personal and professional prejudices, it may safely be asserted that he possessed a singular combination of modesty and dignity of character. He was not only a well-informed and accomplished scholar, but a man of the purest integrity of conduct, of mild and courteous manners, distinguished by genuine piety, and by unaffected benevolence of heart. It is related by one of his biographers, that he bought a sceptical work, left in manuscript by Dr Conyers Middleton, of his widow, for L.50, in order to burn it. He was at the expense of publishing another work of the same author on the Servile Condition of Physicians amongst the Ancients, as well as an edition of some of the plays of Euripides by Markland. He had an opportunity of rendering an essential service to Dr Letherland, a man of the deepest and most extensive learning and science that adorned the last century, but of retired habits, and very little known even in his own profession, though he contributed by his literary information to the popularity of more than one of his colleagues. Dr Heberden's extensive practice made it inconvenient for him to accept the appointment of physician to the queen; and the king, who had always shown him the greatest esteem and regard, readily adopted his disinterested recommendation of Dr Letherland as his substitute in the situation. He died on the 17th of May 1801, at the age of above ninety years, having exhibited at the close of his life the same serenity of mind which he had enjoyed throughout its course. (*Life* prefixed to his *Commentaries;* Chalmers' *Biographical Dictionary.*) (T. Y.)

HEBREW LANGUAGE. See PHILOLOGY, § *Hebrew Language;* ALPHABET, &c.

HEBREWS, EPISTLE TO THE. The authorship of this epistle has been greatly disputed. It has been ascribed to *Luke* by Origen, Jerome, and Philastrius; but, 1st, the similarity of style between this epistle and Luke's admitted writings is too general to support a claim of authorship. 2nd, Admitting Paul to have been the author of the epistle, such similarity of style as occurs between the epistle and Luke's writings could be easily accounted for by the fact that Paul and Luke were much associated together. 3d, The same resemblance between Luke and this epistle can be extended to the epistles which Paul is admitted to have written. Also Stuart and Eichhorn point out the preponderance of Jewish feelings, and familiarity with the Jewish schools, in the epistle over what is found in Luke's writings. Hence Luke is not the probable author of the epistle. Barnabas has been claimed by some as the author This view is supported somewhat inconclusively by Ullmann and Wieseler, the latter of whom has appended a long dissertation on the subject to his *Chronology of the Apostolic Age.*

An Alexandrian origin has been claimed by Eichhorn, Schulz, Bleek, and others, chiefly on account of the close resemblance between this epistle and the writings of Philo, an Alexandrian Jew. Stuart, however, has shown that there is nothing in the epistle which could not have been written by a person who had never quitted Palestine. It is alleged by Bleek that the author of the epistle makes a mistake about the furniture of the tabernacle (ix. 3, 4) which a Jew in Palestine would not have made; but Deyling has shown that there the mistake belongs only to those who have discovered it. The claims of Apollos to the authorship of the epistle fall to the ground with those for an Alexandrian origin. Apollos was first suggested by Luther, and in this the Reformer has been followed by Heumann, Bertholett, De Wette, Bleek, and Tholuck. Clement, Silas, and others, have also been proposed as the authors of the epistle.

The claims of the apostle Paul are founded—1st, upon the doctrinal correspondence between this epistle and his other writings. To him peculiarly belongs the doctrine, that Judaism was typical and temporary; while Christianity was typified and permanent. The glory of the Mediator, both in his humiliation and exaltation, is described in the Epistle to the Hebrews in the same manner as in Paul's admitted epistles. The word *Mediator* occurs only in the Epistle to the Hebrews and in Paul's epistles; so also the expression *the God of Peace*. So obvious are these resemblances in

Hebrews to what occurs in Paul's epistles, that even those who deny his claim admit that the author must have been one of his companions. But, 2d, many of the *figures* used in the Epistle to the Hebrews are Pauline: the Christian life is a *struggle*, a *race;* through Christ we have *access* with *confidence* to God; the *Word of God* is a *sword;* some Christians are only *children*, and to be fed with *milk;* others are *men*, to be fed with *strong meat.* 3d, Peculiarities of style favour the Pauline authorship. Paul is given to the use of *unusual words* in his admitted epistles; unusual words occur in Hebrews; so of paronomasia, and the tendency "to go off at a word" into a long parenthesis; also the manner of reference to Old Testament illustrations; and the multiplication of these references favours the Pauline origin. 5th, The concluding personal references of the writer of Hebrews accord with the supposition of the Pauline origin of the epistle.

The objections to the Pauline authorship are—1st, the difficulty of assigning a reason for the suppression of the name of Paul, were he the author. But the difficulty is just as great whether Luke, or Apollos, or Barnabas, or any other be supposed to have written the epistle. 2d, Eichhorn urges that the Epistle to the Hebrews is more logically reasoned than accords with the Pauline authorship. It is answered that the reasoning of the Epistle to the Romans is as closely logical as that in Hebrews. Tholuck urges that Paul nowhere calls Christ priest, shepherd, apostle, &c.; it is replied that Paul applies figurative appellations to Christ according to the peculiarities of the parties addressed. To speak of priests to Gentiles could not be done without explanation. It was quite otherwise in addressing Jews, who had a priesthood of divine appointment; so of other names.

As to external evidence, the Pauline authorship was universally received from the first by the Eastern Church. In the Western Church, however, it was not so universally adopted till the fifth century. The general result is—1st, no better claims can be urged than those of Paul; 2d, there is no decided obstacle in the way of his claims; and, 3d, both internally and externally the evidence preponderates in his favour.

The object of the epistle was to convince Jewish Christians of the superiority of Christianity over Judaism. It was written before the destruction of the temple.

HEBRIDES, The, or Western Islands of Scotland, consist of about 200 islands or islets, lying between N. Lat. 55. and 58. 51., and W. Long. 5. and 7. 52. Their ancient name was *Hebudæ* or *Ebudæ*, and the alteration was simply the result of a printer's error in an early edition of the works of the venerable Bede, published in Paris. From the census returns it appears that in 1851 the number of inhabited islands in the Hebrides was 79, having a population of 116,367; from 20 to 30 more are partially inhabited during the summer and grazing season. The most southern of the group are situated on the Firth of Clyde—as Bute, Arran, the Cumbrays, Lamlash, and Inchmarnoch. The geological formation of these islands includes granite, gneiss, slate, trap, sandstone, and limestone. Arran is peculiarly rich in attractions both to the geologist and botanist, and possesses highly picturesque scenery. The other islands are usually divided into the *Outer Hebrides*, or Long Island, and the *Inner Hebrides.* The former consists of the Lewis, Harris, North and South Uist, Benbecula, Barra, and a number of smaller islands—the whole length from Barra-Head to the Butt of Lewis being about 130 miles. The Inner Hebrides include Islay, Skye, Mull, Jura, Coll, Colonsay, Rum, Tiree, Ulva, Lismore, &c. The outer range consists almost exclusively of gneiss rocks, with poor soil and large proportions of moss and moor. The inner range is composed chiefly of trap and slate—"a basis," as is said by a recent authority, "for the most part of secondary sandstones and limestone, out of which have arisen from the fiery nucleus of the earth, enormous overlying, and, in some cases, overflowing masses and mountains of trap rocks, chiefly greenstone, sienite, basalt, hyperstene, and an endless variety of pitchstone, claystone, and felspar porphyries, with their associated crystals and minerals." The magnificent basalt columns and caves of Staffa are well known. The islands are not rich in minerals. Iron has been found in several of them, but the want of coal in sufficient abundance renders it of but nominal value. Lead exists, and was sometime wrought in Islay. In Skye and Tiree are marble quarries, which also were worked for a short time, but are now abandoned. There are excellent slate quarries at Easdale, Luing, Seil, Shuna, Lunga, &c.—a small and intricate group of islands annexed to Argyllshire, which, from the number of workmen employed, the workmen's houses, and vessels shipping cargo, present a busy and animated scene. The Outer Hebrides are almost wholly destitute of wood. For miles the eye ranges over tracts of dreary moss, though efforts have been made in Lewis to redeem the sterility of the soil. At one time the manufacture of kelp from the seaware afforded employment to the people of Barra, Harris, Lewis, Skye, &c., but the reduction of the duty on salt and barilla has nearly extinguished this branch of Hebridean trade. When Dr Johnson visited Skye in 1773, agriculture was neglected, and there was scarcely a vegetable grown on the island. Now arable farms, cultivated with care and skill, and gardens producing all the fruits and flowers grown in Scotland, are found. The mild and humid climate of the islands is peculiarly favourable to vegetation, and vast improvement has been effected. Arable cultivation, however, is in most districts considered subordinate to grazing and sheep-farming. The greater part of the surface consists of mountains incapable of cultivation. The valleys by which these mountains are intersected are narrow, and frequently covered with peat-moss, and the sides of the valleys are often too steep and rocky to be fit for tillage. But the most formidable obstacle to the profitable pursuit of corn-farming is the excessive humidity of the climate, which no industry can overcome, and no skill obviate. The drenching rains and cloudy skies for which the Hebrides are so notorious, frustrate the efforts of the cultivator in every stage of his operations. In winter the finer particles and every soluble and fertilizing ingredient in the soil are washed away; in spring the land cannot be brought to the requisite condition for receiving the seed; in summer the corn is etiolated and does not fill, and in harvest the process of ripening is retarded, and the crop is often little better than straw. In truth, the islands are essentially pastoral. Drainage and artificial manures have done much, and there are farms in Skye and Islay which may vie with any on the mainland, but the general characteristics of the islands are such as we have described. Rearing of cattle (which is carried on to a considerable extent) and sheep-farming seem to be the only sure and profitable occupations. Much of the land has been converted into sheep-walks, on which large flocks of Cheviot sheep are now reared, and sold at the Inverness or Falkirk trysts. The Crinan and Caledonian canals offer facilities for export and intercommunication; steamboats from Glasgow now visit most of the islands; and excellent roads, under the charge of a parliamentary commission, traverse the principal districts. The impulse which all these combined have given to trade and production need not be described. The moors and desolate tracts are often let at high prices to English sportsmen. Every year the passion for field sports, especially deer-stalking, seems to increase, and many Highland lairds derive a larger revenue from their moors than their grandfathers did from their whole estates. One great and permanent interest in the Hebrides is that of the fisheries. This has never been prosecuted with sufficient spirit or perseverance. The Lewis islanders are perhaps the most active;—of old, Barra was celebrated for its bold seamen and fishermen, but their descendants are sunk in apathy and poverty. To Lowland adventurers is left the chief harvest of these distant seas.

The scenery of the Hebrides may be generally described as partaking of the wild and sublime. Large masses of mountains, of all forms, tower up in the interior; and the coasts, indented by arms of the sea, are rugged and varied in outline. Skye is now a favourite resort of tourists. The Bay of Scavaig, Loch Coruisk, Glen Sligachan, and the Cuchullin Hills, are scenes of almost unexampled grandeur and picturesque desolation. The Spar Cave, with its lofty chamber and white translucent stalactite, and the mighty ocean-temple of Staffa, have no parallels. Spots of great beauty—green pastoral glens, sheltered bays and lakes, are interposed amidst the wildest scenes. Even among the rough rocks of Harris and Barra, enchanting marine views burst on the spectator. In winter they are terrible; but "what can be more delightful," asks a native of that solitary coast—the late Professor Macgillivray—"than a midnight walk by moonlight along the lone sea-beach of some secluded isle, the glassy sea sending from its surface a long stream of dancing and dazzling light, no sound to be heard save the small ripple of the idle wavelet, or the scream of a sea-bird watching the fry that swarms along the shores? In the short nights of summer, the melancholy song of the throstle has scarcely ceased on the hill-side, when the merry carol of the lark commences, and the plover and snipe sound their shrill pipe. Again, how glorious is the scene which presents itself from the summit of one of the loftier hills, when the great ocean is seen glowing with the last splendour of the setting sun, and the lofty isles of St Kilda rear their giant heads amid the purple blaze on the extreme verge of the horizon!" We may add that a sail on a summer day down the Sound of Mull, amidst the archipelago of islands, gigantic mountain-ranges in the distance, and by the shores, perched on projecting rocks and promontories, the ruins of Dunolly, Dunstaffnage, Duart, Ardtornish, Mingarry, &c.,—"chiefless castles breathing stern farewells,"—is an event never to be forgotten or remembered without emotion.

The original inhabitants of the Hebrides seem to have been of the same Celtic race as those settled on the mainland—the Scoto-Irish, whom Columba, about the middle of the sixth century, converted to Christianity. Scandinavian hordes then poured in, with their northern idolatry and lust of plunder, but in time they adopted the language and faith of the islanders, and were recognised as Earls of Orkney and Kings of the Hebrides and Isle of Man. The chief seat of their sovereignty was at Islay. About the year 1076 or 1096 died in Islay, Godred Crovan, King of Dublin, of Man, and of the Hebrides. He was succeeded by Olaus or Olave, and the daughter of Olaus was married to Somerled, or Sorlet (in Gaelic *Somhairle*, and corrupted by chroniclers into Sorli Marlady, &c.), who became the founder of the dynasty known as Lords of the Isles.[1] From the year 1156 to 1164, Somerled was styled Prince of Argyll *(Regulus Eregeithel)* and Lord of Kintyre. After a rebellion of twelve years against the Scottish monarch, Malcolm IV., he was slain in 1164, and was succeeded by his son Reginald, who styled himself Lord of Inchgall (the Western Isles), and also King of the Isles and Lord of Argyll and Kintyre. This Reginald, his son, and grandson, were monks of Paisley, and liberal benefactors to the monastery there. Angus Oig, the fifth of the race of Somerled, in 1306, after the defeat of Robert Bruce by John of Lorn, entertained the king for three days at his castle of Dunaverty, in South Kintyre. Previous to this many efforts had been made by the Scottish monarchs to displace the Norwegians. Alexander II. led a fleet and army to the shores of Argyleshire in 1249, but he died in the island of Kerrera. On the other hand the Norwegian sovereign was no less indignant at the independence assumed by the Jarls, or governors of the islands, and at the indignities offered to his subjects. King Haco or Hacon sailed with a great fleet and army to assert his rights. The exact date of his expedition is ascertained by a fact illustrative of the light thrown by science on history. The Norwegian chronicler remarked, that when the king lay with his fleet in Orkney, "a great darkness grew over the sun, so that only a little ring was bright round his orb." The eclipse was calculated, and found to have taken place on the 5th of August 1263. Haco's fleet was shattered by tempests in the Firth of Clyde, and the portion of his army which landed was defeated at Largs. The discomfited monarch retreated, passing the narrow strait between Skye and the mainland (which still bears the name of Kyle-Hacon, or Kyleakin), and reaching Orkney, died there on the 12th of December. Magnus, son of Haco, concluded a peace with the Scots (1266), renouncing all claim to the Hebrides and other islands, excepting Orkney and Shetland, and King Alexander agreed to give him a sum of 4000 merks in four yearly payments. It was also stipulated that Margaret, daughter of Alexander (then only four years of age), should be betrothed to Eric, the son of Magnus—a connection long remembered and lamented in Scottish song and story.

The race of Somerled continued to rule the islands, and from a younger son of the same potentate sprung the Lords of Lorn, who took the patronymic of Macdougall. John of Isle or Islay, between the years 1346 and 1354, first adopted the title of "Lord of the Isles." He was one of the most potent of the island princes, and was married to a daughter of the Earl of Strathern, Steward of Scotland. His son, Donald of the Isles, was memorable for his rebellion in support of his claim to the earldom of Ross. The chiefs of Mackintosh and Maclean joined his standard, but Donald was defeated or weakened at the battle of Harlaw, fought in July 1411, and was ultimately compelled to make submission, and abandon his claim to the earldom. His son Alexander resumed the hereditary warfare against the Scottish crown. The sceptre, however, was now in the firm and unrelenting hand of James I.; and the Lord of the Isles, after undergoing, with his mother, the Countess of Ross, imprisonment for a year, was fain to make abject submission, delivering up his sword on his knees. The son of Alexander, John of the Isles, soon however appears in an attitude of sovereignty, treating as an independent prince with Edward IV. of England. In 1462 was concluded, between John of Isle, Earl of Ross and Lord of the Isles, and King Edward IV., the treaty of Ardtornish, by which John, his son Donald Balloch, and his grandson John of Isle, became bound to assist King Edward and James Earl of Douglas in subduing the kingdom of Scotland. The reward promised for this high service was not great. They were to receive respectively, in time of war, L.200, L.40, and L.20 yearly; and in time of peace 100 merks, L.20 and L.10 sterling. The alliance seems to have led to no active operations, and the island king was adjudged to be a traitor to his liege sovereign of Scotland, and deprived of his earldom of Ross, which was annexed to the crown. In the reign of James V. another John of Isla resumed the title of "Lord of the Isles," but was compelled to surrender the dignity. He afterwards laid siege to the Castle of Ellandonan in Ross-shire, and was slain with an arrow. The glory of the lordship of the Isles—the insular sovereignty—had departed. From the time of Bruce, the Campbells had been gaining the ascendancy in Argyll. The Macleans, Macnaughtons, Maclachlans, Lamonts, and other ancient races had sunk before this favoured family. The lordship of Lorn was wrested from the Macdougalls by Bruce, and their extensive possessions, with Dunstaffnage Castle, bestowed on the king's relative, Stewart and his descendants, afterwards Lords of Lorn. The Macdougalls, at a subsequent period, regained possession of their ancient residence, Dunolly Castle, but this branch of the house of Somerled was never reinstated in its former importance. The Macdonalds of Sleat, the direct representatives of Somerled, though driven from Islay and deprived of supreme power by James V., still kept a sort of insular state in Skye. There were also the Macdonalds of Clanranald and Glengarry (descendants of Somerled), with the powerful houses of Macleod of Dunvegan (*Siol Tormod)*, and Macleod of Harris *(Siol Torquil)*, M'Neill of Barra, and Maclean of Mull.[1] Fierce sanguinary feuds continued throughout the 16th and 17th centuries among these rival clans and their dependent tribes, and the turbulent spirit was not subdued till a comparatively recent period. James VI. made an abortive attempt at the colonization of Lewis. William III. and Queen Anne attempted to subsidize the chiefs in order to preserve tranquillity, but the wars of Montrose and Dundee, and the Jacobite insurrections of 1715 and 1745 showed how futile were all such efforts. It was not till 1748, when a decisive blow was struck at the power of the chiefs by the abolition of heritable jurisdictions and the appointment of sheriffs in the different districts, that the arts of peace and social improvement made way in these remote regions.

[1] Worsaae's *Danes*. *Origines Parochiales Scotiæ*, Bannatyne Club, 1854.

The change was great, and at first not unmixed with evil. It was no longer the interest of the chief to surround himself with a host of dependents. His strength lay in money, not in arms. A new system of management and high rents were imposed, in consequence of which numbers of the tacksmen, or large tenants, emigrated to America. In twenty years, from 1772 to 1792, about 6400 persons left the country, carrying with them, in specie, at least L. 38,400. The exodus continued for many years. Sheep-farming, on a large scale, was next introduced, and the crofters were thrust into villages or barren corners of the land. The consequence was, that despite the numbers who entered the army, or emigrated to Canada, the standard of civilization sunk lower, and the population multiplied in all the islands. The people came to subsist almost entirely on potatoes and herrings; and in 1846, when the potatoe blight commenced its ravages, a scene of nearly universal destitution ensued. The population of Skye, which Johnson, in 1773, considered too great for the means of subsistence, had swelled from 15,000 to 24,000; and of these, 8000 (one-third) demanded and received relief from the Destitution Fund nobly provided by the British nation. In Tiree there were 1400 people who paid no rent and had exhausted the fuel on the island. Over the islands, generally, the proportion of destitution was in the ratio of 70 per cent. of the population. Temporary relief was administered in the shape of employment on roads and other works; and an emigration fund being raised, from 4000 to 5000 of the people, in the most crowded districts, were removed to Australia, where labour, and the reward of labour, awaited them. The condition of the islanders at home is still deplorable. To elevate them must be the work of many years; and a still more extensive family emigration seems necessary as a preliminary step. Education in the English language is also required, to which should be added the prosecution of the fisheries on a better basis, and the colonization in the Hebrides of east coast fishermen (descendants of the industrious and hardy Shetlanders and Scandinavians) in eligible fishing stations.

Hebrides, *New*, a group of islands in the Pacific Ocean. See Australasia (vol. iv., p. 265).

HEBRON, a very ancient city of Palestine, in the tribe of Judah, 18 miles S. of Jerusalem. Its most ancient name was Kirjath-arba, *i. e,* "the city of Arba," so called from Arba, the father of Anak and of the Anakim, who dwelt in and around Hebron. The patriarchs Abraham, Isaac, and Jacob resided much at Hebron, and are there entombed. The ancient city lay in a valley; and the two remaining pools, one of which at least existed in the time of David, serve with other circumstances to identify the modern with the ancient site. David on becoming king of Judah, made Hebron his royal residence, and reigned here seven and a half years. Its modern name is *El Khulib*, "the friend" of God, the title by which the Moslems designate Abraham. In modern history Hebron is chiefly noted for the part taken by its inhabitants in the rebellion of 1834, and the heavy retribution which it brought down upon them. They gave battle to Ibrahim Pasha near Solomon's pools, but were defeated, and retired within the city, which was taken by storm, and given over to sack and pillage. The town of Hebron lies low down on the sloping sides of a narrow valley. The houses are all of stone, high and well-built, with windows, and flat roofs, on which are small domes, sometimes two or three to each house. The streets are narrow, seldom more than two or three yards in width. The bazaars and shops are well supplied with commodities. It has nine mosques, the principal of which is the massive structure built over the tombs of the patriarchs. This is esteemed by the Moslems one of their holiest places, from which Christians are rigorously excluded. Hebron has long been noted for the produce of its glass-works, consisting chiefly of glass lamps, many of which are exported to Egypt. Pop. variously estimated from 5000 to 10,000.

HEBRUS, now the Maritza, the largest river in Thrace, rises in the high ground between Mounts Scomius and Rhodope. It flows in a S.E. direction from its source to Hadrianople; from that city to the sea its course is almost due S. It falls into the Ægæan nearly opposite the island of Samothrace, and forming at its mouth the Palus Stentoris. Unlike most of the rivers in Greece the Hebrus is navigable for about two-thirds of its course. Small craft sail up as far as Philippopolis. Its principal tributaries are the Artiscus (Bujuk-déré), the Agrianes (Ergene), Contadesdus (Saradjala), and Tearus (Tekedéré). It was at the source of the Hebrus that Darius erected a pillar with an inscription to the effect that its waters were the purest and best, just as he himself was the fairest of men.

HECATÆUS, one of the earliest of the Greek historians. He was sprung from a noble family of Miletus; his father's name was Hegesander. The dates of his birth and death are not ascertained; but he is known to have taken part in the counsels of the Ionians when they were deliberating to throw off the Persian yoke. He tried to dissuade his countrymen from this attempt; and as he was well acquainted with the strength and resources of the Persian empire, he dwelt on the hopelessness of a contest with so powerful an antagonist. His advice was neglected, and the consequence followed which he had predicted. This fixes his *floruit* about 500 B.C. Like Herodotus, Hecatæus seems to have visited foreign countries, and to have described, from personal observation, their physical characteristics, and the manners and customs of their inhabitants. His works were of three kinds, historical, genealogical, and geographical, and were held in some esteem by the ancients. Herodotus sometimes refers to him as an authority. The numerous fragments of his works which have come down to us have been collected by Creuzer in his *Historicorum Antiquissimorum Fragmenta.* (See *Mémoires de l'Académie des Inscript.*, tom. vi., p. 475; Vossius *de Hist. Græc.*, p. 440; and Ulrici, *Charakteristik der antiken Historiographie*, Berlin, 1833.)

---

[1] The M'Neills were originally of Irish origin. It is related that when the chief dined, a horn was sounded from the battlements of the castle tower in Barra, and a herald proclaimed, "Hear, O ye people, and listen, O ye nations! The great M'Neill of Barra, having finished his meal, the princes of the earth may dine!" The charters granted by the Macdonalds ran in a similar mock-heroic strain:—"I, Macdonald, give you a right to your farm from this day till to-morrow, and every day thereafter, so long as you have food for the great Macdonald of the Isles."

HECATE, in *Grecian Mythology*, the name of a mysterious goddess, who, in many of her attributes, bore a strong resemblance to Diana. Her power was at one time so extensive that she was identified with several other deities, such as Proserpine, Ceres, Cybele, and especially Diana or Artemis. Her statues were set up in cross-roads and in front of houses. She was worshipped with peculiar honours at Athens and Ægina, where she was regarded as the patron goddess of the domestic hearth. The sacrifices offered to her consisted chiefly of black lambs, dogs, and honey. (See Diana.)

HECATOMB, in *Grecian Antiquity*, signifies, according to its etymon, an offering of a hundred oxen. Even before Homer's time, however, the word had lost its strict etymological meaning, and was employed to denote generally a great public sacrifice. Homer himself (*Il.* vi., 93) talks of a hecatomb of twelve oxen; and again (*Il.* i., 315), hecatombs of oxen and rams; and even (*Il.* xxiii., 146) a hecatomb of fifty rams. Later writers used sometimes to reckon even the votive gifts under the hecatomb. (See Sacrifice.)

HECATOMBÆON, in *Grecian Antiquity*, the first month in the Attic year, answering to the last half of our July and the first of August. It took its name from the great festival of the Hecatombæ, at which hecatombs were offered.

HECHINGEN, a city of Germany on the Starzel, 31 miles S.S.W. of Stuttgart. It was capital of the sovereign principality of Hohenzollern-Hechingen, which was ceded to Prussia in 1849. Pop. about 3400.

HECLA, a volcano of Iceland. See Iceland.

HECTOLITRE. See France, § *Weights and Measures.*

HECTOMETRE. See France, § *Weights and Measures.*

HECTOR, in *Grecian Story*, the most valiant foe that the Greeks had to encounter in the siege of Troy. He was the eldest son of Priam and Hecuba, and of all the Trojan chiefs was the wisest in counsel and the bravest in the field. During the whole continuance of the siege he was the bulwark of his country, devotedly meeting all risks, and bravely encountering all odds. He slew some of the most distinguished leaders of the Grecian host, and fought on equal terms with Menelaus, Ajax, Diomede, and others. His last exploit was his conquest of Patroclus, the friend of Achilles, whom he slew and stript of his armour. The death of Patroclus roused Achilles from the lethargic indifference which he had maintained since he had been insulted by Agamemnon. He sought out the slayer of his friend, and Hector fell in the encounter. His victorious foe dragged his corpse three times round the walls of Troy; but the body was preserved from injury by the gods. Some of the scenes in which Hector takes part are among the finest in the Iliad. Such are his interview with his brother Paris, and afterwards with his wife Andromache and his son Scamandrius at the Scæan gate (book vi.); his final combat with Achilles; and after his death, the interview of his aged father with that chief concerning the ransom of the slain hero's body. The *Iliad* closes with the description of the funeral rites and games in his honour.

HECUBA, the daughter of Dymas (Hom. *Il.* ii., 718), or of Cisseus (Eurip.), or of the River Sangarius and Metope (Apollodor. iii., 12, 5), was the second wife of Priam, and had by him nineteen sons and a great number of daughters. Of the sons, the most celebrated were Hector, Paris, Deiphobus, Helenus, Polydorus, Troilus; and of the daughters, Polyxena, Cassandra, Creüsa, and Laodice. When Hecuba was pregnant of Paris, she dreamed that she had brought into the world a burning torch, which reduced her husband's palace and all Troy to ashes. This dream was interpreted to mean that the son she should bring into the world would prove the destruction of his country. To avoid this, she exposed Paris as soon as he was born; but he was saved by shepherds, and afterwards acknowledged by his parents. During the Trojan War she witnessed the death of nearly all her children, and at last saw her husband murdered before her eyes. (Virg. *Æn.* ii.) When Troy was taken, Hecuba fell to the lot of Ulysses. They set sail and landed in the Thracian Chersonnesus, where Hecuba learned that her son Polydorus had been murdered by Polymnestor, the ancient friend of the Trojans, to whom Priam had sent him. She proceeded with some Trojan women to the house of Polymnestor, put to death two of his sons, and tore out his own eyes. Polymnestor foretold to her that she would be changed into a she-dog, and would leap into the sea at Cynosema. The tradition further says, that under this form she ran for a time howling through Thrace, till she was at length stoned to death by the inhabitants.

HEDGEHOG. See index to Mammalia.

HEDJAZ, El, a district of Arabia. See Arabia.

HEDWIG, Johann, a distinguished German botanist, was born in 1730 at Cronstadt, in Transylvania. He early lost his father, and was obliged to fight his way as he best might through his medical course. This he did manfully and honourably. After graduating at Leipzig he returned home, only to find that it was not lawful for him to practise with a foreign diploma in the Austrian dominions. He then removed to Chemnitz in Saxony; and thence, in 1781, to Leipzig, where he published his great work on the mosses under the title of *Fundamentum Historiæ Naturalis Muscorum.* This work secured him the chair of botany at the university, when it fell vacant in 1789. He held it till his death in 1799. Hedwig was an excellent observer; one of the best, indeed, of last century. In microscopic researches his skill was pre-eminent. Two valuable qualities in an observer he combined in a very unusual degree—memory and keenness of eye-sight. Besides his *Fundamentum*, he wrote many other scientific works and papers, nearly all bearing on his favourite study, but none of them approaching in value the important work with which his fame is now identified.

HEGEL, George Wilhelm Friedrich, was born at Stuttgart, on the 27th of August 1770. At the age of eighteen he entered the University of Tübingen. During his philosophical and theological curriculum he was the chosen friend of Schelling, who, though his junior, at this time far outshone his destined rival. He took his degree in 1793; and for the following eight years was engaged as a private tutor, partly in Berne, and partly in Frankfurt-on-the-Maine. During this period he entered deeply into those theological, historical, and political studies, the results of which in after-life gave so much lustre to his peculiar system. But his mind was already becoming more and more exclusively bent towards philosophy. The death of his father in 1799 having left him in possession of some property, he gave up private teaching, and in 1801 went to the University of Jena with the view of qualifying as an academical lecturer. At this time his earliest publications were issued (Jena, 1801), viz., his *Habilitations-Schrift, De Orbitis Planetarum;* and an essay—*Ueber die Differenz des Fichte'schen und Schelling'schen Systems.* Soon after he embarked, along with Schelling, in the publication of the *Critische Journal der Philosophie.* During the six following years he was engaged in the preparation of the earliest of his larger works, the *Phænomenologie des Geistes* (Bamb. 1807). In 1806 he was made professor of philosophy at Jena. But the disastrous campaign of that year drove him to Bamberg, where for two years he was editor of a political journal. In 1808 he became rector of the Academy of Nüremberg. During the last four years of his residence there he issued the second of his great works—*Wissenschaft der Logik* (Nürem. 1812–16). In 1816 he was removed to a chair of philosophy at Heidelberg. Here he published his *Encyclopædie der Philosophischen Wissenschaften* (Heidel. 1817). In 1818 he at last reached a position where his genius found full scope and appreciation. He was called to Berlin, to fill the chair of Fichte; and here he remained till his death, the acknowledged chief of the German philosophers. Men of all ranks and professions, even from foreign countries, flocked to his lectures. A school of zealous disciples formed around him. In 1827 a review (*Jahrbücher für Wissenschaftliche Critik*) was established as the organ and advocate of his doctrines; and through the influence of the minister Von Altenstein, his scholars came to occupy many of the professorial chairs in the Prussian universities. Thus honoured and rewarded, Hegel survived till 1831, when he was cut off by cholera (14th November), in the sixty-first year of his age. During this period he had published his *Grundlinien der Philosophie des Rechts* (Berlin, 1821). Soon after his death a complete edition of his works was commenced by a number of his scholars. Besides those published in his lifetime, this issue included his lectures on the *Philosophy of Religion*, on *Æsthetics*, on the *Philosophy of History*, and on the *History of Philosophy;* and also a copious *Life* of Hegel by Rosenkranz, forming the last volume of the series. It was completed in 1844, in 18 vols. octavo.

Hegel did not stand alone; he stood at the culminating point of German philosophy, towards which there had been a continuous progress ever since the days of Kant. That great thinker, in opposition to the reigning sensationalism of his time, had chiefly devoted himself to the investigation and vindication of our *a priori* principles of knowledge;—of those principles, regulative and constitutive, *analytic* and *synthetic*, which depend upon experience only (as the spark in the flintstone depends upon the steel) as the occasion of eliciting them into conscious recognition, and which, moreover, being prior to experience in the order of thought and of nature, though posterior to it in the order of time, are necessary in order to the possibility of experience itself. But while vindicating, with a hitherto unequalled power and success, the independence of our *a priori* knowledge to experience, Kant left experience itself and its *a posteriori* products on a very unsatisfactory footing. He held that the *data* of the *sensory*, of perception internal and external, must be recognized as valid for practical purposes; but he refused to recognize their truth and validity within the sphere of speculation. As he was thus confessedly unable to bridge over the gulf between the internal and the external, the ideal and the real, his system was one of virtual idealism. The Gordian knot which Kant thus failed to untie was boldly cut by the subjective idealism of Fichte. Beginning with the admitted impossibility of establishing the existence of an external world, Fichte carried it out to this conclusion, that for man there *is* no external world; that as no other thing *is known* to him, so in fact no other thing *exists for* him, but his own mind; that self, or the "*ego*," is the universe. The objective idealism of Schelling was an attempt to deliver the human spirit from the prison-house of the *ego* in which it had been thus pent up by Fichte. The question was, how to find a way out of it to the knowledge of something beyond. The good old way of common sense, external perception, was not to be thought of. Accordingly, Schelling hit upon the old Platonic figment of *intellectual intuition—Anschauung*—a state of cognition in which the soul transcends the ordinary conditions of thought and limitations of being, and gazes directly upon the unconditioned, the self-existent, the *absolute.* This absolute, the object of intuition, has a real existence beyond the knowing subject. At the same time subject and object, ideal and real, though diverse, are identical; they are but opposite poles of the same universal subject, of the one, true, indivisible, absolute object—the living soul of the universe. Thus the solid footing which Kant had failed to find for metaphysics was sought by Fichte and Schelling in the knowledge of the absolute. Fichte assumed this transcendent reality as existing in man himself; Schelling, as—phenomenally, at least—manifesting itself *ab extra.*

Only one step further remained to be taken; that step was taken by Hegel. He, too, seeks to solve the same problem by an assumed knowledge of the absolute. But this absolute with him is not a universal *substance*, as with Spinoza; or *self*, as with Fichte; or a universal *mind* or *subject*, as with Schelling. Hegel's absolute is neither matter nor mind, neither a substance nor a subject, external nor internal; but *a process*, even the process of thought itself. The constitutive principle of his system is the identity of thought and existence. And it is not merely that the ideal and the real *are* identical, as in the system of Schelling; it is this *relation* of identity that is the sole reality—the absolute itself. And again, it is not merely that the absolute may be recognized, as by Schelling's *Anschauung*, as uniting in itself the subject and object; it is this *recognition* that *constitutes* the absolute, because it is only in this conscious recognition that the unity is realized or brought into being. Thus, the process of apprehending, and the object apprehended, the absolute thought and the absolute existence, are one; all being is represented by the term absolute idea; this process, thought, or idea, is the ground of all existence, embracing in its bosom, as its possible developments, God, the universe, and man.

Having thus indicated the marvellous results, let us now revert to the method by which they have been reached. This is the more necessary in the present case, because it is its method, or dialectic, which forms the distinctive peculiarity of the Hegelian system. In fact, Hegel's aim at first was, not so much to establish a new system, as to give scientific form and method to the somewhat loose materials thrown out by Schelling. Hegel's genius was severely systematic; and the *Anschauung* which his illustrious friend had invented as an organ of constructive thinking, was to him only a stumbling-block. It grieved him to see the absolute arrived at in this arbitrary way—"shot," as he himself expressed it, "out of a pistol." So, in place of this intuition, he resolved to substitute a rigidly dialectic method. With this view, he first of all (in his *Phaenomenologie*) instituted an inquiry into the process by which, in point of fact, man does arrive at the knowledge of the absolute. This process, both in the individual mind and in that of the race, he found to embrace three distinct epochs—three successive, progressive, and mutually connected stages of intelligence. The *first* is that of pure and simple sensational intuition; in which the subject is barely conscious, being aware of no object, but merely of a "here" and a "now." The *second* is that of perception or understanding; in which the subject and object appear as diverse and contrasted; in which they are regarded only as opposites or contraries; in which the thinker regards the objects of his thought as having an independent existence, and forming a world distinct from the thought itself. The *third*, last, and highest, is that of *absolute thought.* Here the point of view is reached from which man attains to the knowledge of the absolute The multiplicity of the second epoch or stage now disappears, by being brought back into a unity—*a unity which consists in the recognized identity of the seemingly contrasted opposites.* But this recognition is now no longer, as in the first epoch, a mere undeveloped sensation; it is an act of thought, carrying along with it a distinct consciousness of the seeming or phenomenal diversity of the things thus brought into one.

But we have not merely thus reached the point of view from which the absolute is descried, or, in other words, that absolute thought in which the absolute consists. In so doing we have also discovered the *regulative principle*—that of the *identity of contraries*—which has presided over its genetic development. This principle or law is the immanent fate or inborn necessity of thought. By the force of this law the subject in its first stage is eternally constrained to project itself into an object; and the contrast thus produced gives birth to the second stage. But by the same law the thinker or thought is made to seek for the recognition of the unity of these apparent contraries; and in seeking and finding their unity the last and highest stage of thought is reached. Further, in thus discovering the development of thought, we have also found the law of the history of *being*. For thought and existence are identical. And therefore the principle of the identity of contraries, in being the law of thought, is also the law of things; and thus we have the materials, not only of a logic, but also of a metaphysic; the faithful application of this one law will enable us to deduce, from the bare idea of being, a true history of actual things, a complete system of the universe.

This, in fact, is what Hegel professes to have accomplished. His only postulates are, the identity of thought and existence as a *constitutive*, and the identity of contraries as a *regulative* principle. This regulative principle guides him through all the departments of human knowledge, in all their details and ramifications. Everywhere he finds the same rhythm endlessly repeated, the one unvaried trilogy of, first, the idea simply; then, the idea of opposites as contrasted; and then, the contraries returning into a recognized unity. In thus following out his principle to its results he has shown wonderful dialectic skill, and at the same time lighted incidentally upon many views of real value to true philosophy. Let us illustrate his principle by its application. By his self-imposed limitation, he feels compelled to begin with the barren, empty idea of being, eviscerated of all contents, and in fact equal to nothing; and from this *Seyn=nichts* to develop the universe in the following manner:—1st, We have pre-supposed the bare idea, being, or thought (for they are identical), as yet undeveloped, and recognizing nothing beyond itself. 2d, The immanent necessity of its own law causes thought to project itself into externality or objectivity; and thus gives to us *nature*, and the philosophy of nature. 3d, Under the impulse of the same necessity, the thought, or idea, or being, is carried to its completed evolution, by a regression to the primitive unity, but now a unity that is consciously recognized; and this self-consciousness gives *mind*, and the philosophy of mind. Thus the universe is produced; and by the same method we arrive at all its varied details.

Speculations so shadowy, unsubstantial, and wildly remote from men's living sympathies and interests, might safely be allowed to pass away unrecorded into their native dreamland, if it were not that certain of their practical consequences, or rather of their practical aspects, invest them with a deep, and even a tragic interest. We might perhaps be disposed to recoil from the view which this system gives us even of what we are accustomed to speak of as the material world; for surely to describe nature as being merely one of the manifestations of thought, is not to *explain* nature, but to substitute a shadow in its place. This, however, might be tolerated, side by side with the ingenious speculations of our own Berkeley. It is only when we look upon the great realities of the spirit-world in the light of the Hegelian pantheistic idealism, that its frightful consequences fully unfold themselves to our view. In reviewing Hegel's deduction of the universe from the abstract idea (or being=nothing), we naturally inquire, Where is *God* to find a place in this system? In answer to this, we are told that he is in the universe, as the soul is in the body, "all in the whole, and all in every part." The absolute thought or existence itself is God; who, therefore, reaches self-consciousness and personality only in the person and consciousness of man. This is, in effect, to affirm that there is no God—*i.e.*, that there is no personal, supreme, intelligent being, distinct from and presiding over the universe; that creation and providence are not the actions of a free agent, but the mechanical operation of a *nothing*, obeying the constraining power of the law of the identity of contraries. To say that though God is not a person, yet he is personality realizing itself in man, is only to say that the only vestige of divinity in the universe is an attribute of what we are accustomed to regard as one of God's imperfect creatures. And while man is thus seemingly exalted with one hand into a god, with the other he is reduced to a phantom. For man is thus not a separate, independent person, endowed with a free will, and responsible for his actions; he is but the absolute thought in its highest manifestation, ever moved only by the power of the supreme regulative principle of all existence. Human history is not the progression of the free, but the necessary evolution of thought, according to the same all-pervading law of the identity of opposites. And not only is man thus stripped of his distinctive attribute, that of freedom and responsibility, he is at the same time robbed of his distinctive hope, that of immortality. There is, no doubt, a verbal admission of man's immortality, as there is also of God's personality. For, it is said, as God finds his personality in man (by being degraded into the finite), so man finds his immortality in God, by having his being absorbed in the infinite, by sinking back into unconsciousness. Thus man finds immortality by *ceasing to be*, by losing his personality; even as God, in order to *begin to be*, in order to find personality, has to lose his infinity by becoming identified with evanescent humanity. God is but a shoreless, soulless, thoughtless ocean of being, ever striving to come into personal existence in the consciousness of men. The generations of men, past, present, and future, are but the separate waves, or rather, the froth on the crest of the waves of the endlessly evolving tide, destined, each one in succession, to pass away into oblivion and nonentity, as they sink back and are absorbed in the ocean whose heavings gave them a momentary and phantastic existence. Having thus bereft humanity of its three grand moving powers—a personal God, a free will, and a real immortality—it only remained that Hegelianism should extend its baleful influence into the sphere of revelation. And this has not been left undone. While preserving the terminology of orthodox Christianity, and even while professing to be a devout adherent of the Lutheran Church, Hegel contrived to torture the Bible itself until it became a witness for his absolute idealism. Thus the doctrine of the Trinity is that of absolute thought, developing itself in the three-fold movement prescribed by the law of contraries. The fall of man is simply a departure of the absolute idea into a state of objectivity or externality; redemption is a method of restoring the unity thus lost between the soul and God—*i.e.*, between the phenomenal opposites; and the church and its ordinances are the means by which their reunion is symbolized and realized.

The followers of Hegel have been divided into three parties. The "extreme right" endeavour to harmonize the speculations of the Hegelian philosophy with the doctrines of Christianity, to philosophize with their master, and believe with the orthodox Christian. How this can be effected, or even attempted by a sane mind, it is hard for a British intellect to fathom. The "centre" party, again, hold by the principles of Hegel, and deduce from them their legitimate logical results—among other things, the subversion of the historical truth of Christianity. But even here we find evidence of that strange obliquity of intellectual and moral vision which, in those of the "extreme right" we might regard as a misfortune arising from their false position. One of the "centre" (Strauss), avowedly in application of the Hegelian principles, has made a formal attempt to overthrow the authority of the gospels, and reduce their contents to the rank of mythic fables. Thus far might have been expected. But what we cannot reconcile with the supposition of his possessing the feeblest sense of moral distinction is, that this coryphæus of infidelity *was a doctor in divinity!* A third party, the "extreme left," though not shining among the great lights of philosophy, is yet important because of its extended ramifications in Germany, in France, and even in Britain. But while this party have adopted the negative and destructive results of Hegelianism, they have departed altogether from its real principles, spirit, and method. Hegel himself would be the last to recognize as his legitimate offspring the spurious brood of gross materialistic atheism and red republicanism which has assumed his name.

The fontal error, from which consequences so disastrous have flowed, is found in Kant's refusal to hold as valid for speculation the products of experience, the data of the *sensory*, of perception and reflection. This refusal was grounded upon the fact that these *a posteriori* judgments are not, like the *a priori*, possessed of the qualities of universality and necessity. While the German philosophers, down to Hegel, were unfolding the results of this one-sided system, another, and a wiser, though a humbler philosophy, in Scotland, while vindicating as vigorously as they against sensationalism, the idealistic, or *a priori* portion of our knowledge, was no less firmly contending for the reality and validity of the *a posteriori* or contingent elements given in perception and reflection. It was asserted that the only authority, that of consciousnesss, which we possess for the truth of the *a priori*, speaks no less emphatically for the truth of the *a posteriori;* and that, therefore, if upon that authority we accept the one as true, we must also accept the other; if we reject either, we must reject both.

But while a direct refutation of the Kantian error was thus being prepared in Scotland, an indirect, and perhaps a more effective one, was being prepared in Germany itself. In the hands of its own adherents the principle that would reject our experience, in being carried out to its full legitimate results, found a *reductio ad absurdum.* Their fundamental principle, that nought is to be held as valid for metaphysics which does not possess the *criterion* of necessity and universality, renders metaphysic impossible. For metaphysics is the science of being; and being can be made known to us only as *contingent.* All being, all actual concrete existence—God, the world, man, personality, identity, freedom, responsibility—is made known to us, and can be made known to us, only as logically contingent; as something that is; as a matter of fact or history. Being, therefore, can be revealed to us only *a posteriori* through experience—*i.e.*, through the medium of external and internal perception. And thus, in rejecting experience as a source of knowledge, Kant deprived metaphysics of all its possible *materials.* That which remains, the law of contradiction and the causal judgment, is purely formal. These *a priori* principles may themselves be elaborated into the formal sciences of logic and induction; they may give form to matter obtained through experience; but they can never themselves give to us any knowledge of existing things—of an object or objects to be constructed into a science of the actual. Thus we are shut up to a philosophical *rationalism*, compelled to find in our discursive reason itself, not only the principles, but also the constituent elements of our knowledge. It is vain with Fichte and Schelling, after having dethroned intuitive reason in its normal exercise of perception and reflection, to seek for the lost materials of knowledge by such expedients as the "*Anschauung*"—*i.e., the same intuition*, but now, in an arbitrary acceptation, and a confessedly abnormal exercise—the same mind, but now raised to a preternatural and extranatural elevation, to which, although the ascent were possible, no mortal could *be known* to ascend, nor would be able to bring down the results of his exstatic vision so as to render them intelligible to the world below. Hegel clearly saw that this *Anschauung* was but a makeshift. He carried out the rejection of experience to its legitimate results. In his system alone can rationalism be consistent with itself. It is only where *thought* is *existence*, where *logic* is *metaphysics*, that metaphysics not based on experience can exist. But as soon as it thus exists it ceases to be. For in asserting that thought is not only the *organ*, but also the whole *material* and *substance* of our knowledge of the actual, we are at the same moment admitting that this knowledge has *no* material whatever. And thus the coryphæus of idealism is the nemesis of sensationalism; while carrying a false philosophy to its last extreme Hegel has vindicated the true; he has done modern philosophy the service of furnishing, the most impressive refutation, while presenting the most completely and consistently developed exposition, of the German speculative idealism. (J. M'G.)

HEGIRA (from the Arabic *hajara*, to desert), a Mohammedan epoch, dating from the expulsion of Mohammed from Mecca, July 16, A.D. 622. (See CHRONOLOGY and MOHAMMED.)

HEIDELBERG, an ancient and interesting city of Southern Germany, in the grand-duchy of Baden, and circle of the Lower Rhine. It stands in one of the most beautiful spots in the whole of Germany, on the left bank of the Neckar (here spanned by a covered bridge of nine arches, and more than 700 feet in length), about 12 miles above its confluence with the Rhine at Mannheim; N. Lat. 49. 25., E. Long. 8. 42. The town is picturesquely situated at the foot of the finely wooded hills which slope towards the river, while the rising grounds on the opposite bank are covered with the richest vineyards. To the S. is the Königstuhl, or king's seat, which, since it was ascended in 1802 by the Emperor Francis, has been called the Kaiserstuhl. On the top of this hill, which is 2000 feet high, a tower has been erected, from which charming glimpses of the distant Rhine are to be had. In fine weather the spire of Strasburg Cathedral, 90 miles distant, is plainly visible. The streets of the town, which diverge nearly all from one central street, the Haupt-strasse, are narrow and gloomy; and the interest attaching to the great public buildings is more historical than artistic. All the splendid monuments of architecture in which it once abounded have long since perished in the many bloody wars, sieges, and conflagrations, from which the town has suffered so terribly. Of the extant buildings may be mentioned the church of the Holy Ghost in the market-place, which is divided by a partition wall, so that the Catholic and Protestant services are conducted simultaneously in the different compartments; and the church of St Peter, the oldest in the town, and memorable as the scene of the daring exploit of Jerome of Prague, who hung up on its gate his celebrated thesis, in which he attacked the doctrines and practice of the Church of Rome. In the adjoining churchyard is the tomb of the learned Olympia Morata, whose history in many respects resembles that of the celebrated Hypatia. There are two other churches of inferior interest, and a Jewish synagogue. The university, of which the buildings stand in a small square near the centre of the town, is, with the exception of that of Prague, the oldest in Germany, having been founded in 1386. The number of students that flocked to it at one time was very great; but their annual average is now not more than about 700. In the departments of law and medicine it still maintains its ancient renown. Mittermeyer the jurist, and Tiedemann the anatomist, are acknowledged to rank among the first of modern authorities on their respective subjects. Near the university is the library, which contains 150,000 volumes, besides numerous and valuable MSS. The famous Palatine library, sacked and pillaged in the Thirty Years' War, was partly restored in 1815 by Pope Pius VII., to whose predecessors a portion of it had been sent as a present by the Bavarians. There is a tradition that Tilly the imperialist general, being in want of straw for his cavalry after the storming of the town, used the invaluable MSS. of the elector's library to litter his horses. In a suburban building, formerly a Dominican convent, are good museums of anatomy and zoology. By far the most interesting relic of the past in Heidelberg is the castle, once the residence of the electors palatine, and a magnificent combination of the palace and the fortress. It is now in ruins, but is sufficiently well preserved to show the tastes of the different occupants, who added to it the architectural styles of the successive centuries, and the horrors of war in the three conflagrations and ten sieges which it had to undergo. In the beginning of last century it was rebuilt and restored to its old magnificence; but in 1764 it was set on fire by lightning, and burnt to the ground, and since that time it has continued to crumble away an untenanted ruin. In one of the cellars is the famous Heidelberg tun, constructed in 1751, and able to contain 800 hogsheads of wine. It has never been filled, however, since 1769. The view to be obtained from the castle-rock is in its way one of the finest in Europe, and has afforded the material for many a poet's song.

The causes of the decay of Heidelberg are not difficult to trace. In 1622, the era of the Thirty Years' War, it was taken by Tilly after a month's siege, and delivered over to plunder for three days. Eleven years later it was recovered by the Swedes, who did the town nearly as much damage as the Austrians had done. But the cruelties and brutalities of this period were far surpassed by those which devastated the town at the close of the seventeenth century, when the French under Turenne turned the whole palatinate into a desert. In 1688 the town was again stormed and plundered by the French under Melac, in comparison with whom the brutal Tilly was a humane commander and a generous foe. Five years later Melac was in his turn outstripped and left behind by Chamilly, whose fiendish excesses have made the French name a byeword of horror and execration in Germany to this day. It is matter of wonder that after such a history Heidelberg should exist at all. It is a place of no commercial activity, and is increasing very slowly. Were it not for the students and the visitors, whom the beauty and cheapness of the place attract in considerable numbers, the general stagnation would be complete. Pop. about 15,000.

HEILBRONN, a fortified town of Würtemberg, formerly a free imperial city, on the right bank of the Neckar, 26 miles N. of Stuttgart. The most interesting of its buildings is the church of St Kilian, a Gothic edifice with a beautiful tower (225 feet high), the lower part of which was built in the thirteenth century, the upper part in 1529. The town-hall is an antique building, in which some interesting ancient records are deposited; and in the outskirts of the town is the tower in which Götz von Berlichingen was confined in 1525. The house of the Teutonic knights is now used as a barrack. Heilbronn has a gymnasium, public library, and a richly endowed hospital. The vicinity produces a tolerably good wine, and the town itself carries on an extensive transit trade between Frankfürt and South Germany. Its chief manufactures are woollen cloths carpets, tobacco, silver articles, and chemicals. Pop. about 10,000.

HEILIGENSTADT, a town in Prussian Saxony, capital of a cognominal circle in the government of Erfurt, 32 miles E.N.E. of Cassel, on the Leine. It has a castle, gymnasium, normal school for Roman Catholics, five churches, and two orphan asylums. Its chief manufactures are woollen yarns and wooden clocks. Pop. (1849) 5240. Under the French Heiligenstadt was capital of the department of Harz.

HEINE, Heinrich, a distinguished German poet and miscellaneous writer, was born at Dusseldorf, Dec. 13, 1799. His father was a Jewish merchant in that city, in circumstances so humble that without the aid of a wealthy brother in Hamburgh he would not have been able to educate the future poet. On leaving school in 1819 the young Heine became a student of law at Bonn, where he wrote the now forgotten tragedies of *Almansa* and *Ratcliffe*, and some short miscellaneous pieces. In the following year he removed to Göttingen, which in a little while he exchanged for Berlin, where he mixed with the fashionable literary circles. In 1823 he returned to Göttingen, and in due time he graduated there as doctor of law. He first attracted notice as an author by his *Reisebilder* (Pictures of Travel), begun in 1826 and finished in 1829. His *Buch der Lieder* (Book of Songs), extended his reputation; and when the expulsion of the old Bourbons from France in 1830 seemed to point to Paris as the future centre of political action and liberty in continental Europe, Heine established himself in that city, and remained there till his death, Feb. 18, 1856. It was in Paris that he wrote his *Salon*, and *Romantische Schule*, two collections of poems entitled respectively *Neue Gedichte* and *Romanzen*, and his *Vermischte Schriften* (Miscellaneous Works), published in 1854. During the ministry of Guizot he enjoyed a pension of 4000 francs from the French government.

Since the days of Voltaire there has been no such scoffer as Heine; and were it credible that his cynicism was wholly genuine, Voltaire might in comparison with him be almost called an orthodox Christian. Nothing that men have ever considered sacred or estimable has escaped his sneer. Christianity of course he mocked at; and when in his latter years he professed himself a convert to it, it was discovered from his own *Confessions* that he had not embraced Christianity, but had merely ceased openly to countenance atheism, because it had grown vulgar. He alternately mocked and praised every generous and noble sentiment; and he found an endless subject of scoffing in the diseases that confined him almost entirely to his bed during the last eight years of his life. The very agonies of mental and physical torment that he underwent he seemed to delight in intensifying by describing them in their minutest details, and then laughing at them and his own descriptions of them. His poetry repays perusal better than his prose, which is often flippant, epigrammatic, and merely smart; but his poetry is in a style peculiarly his own. "Other bards," says a recent critic, "have passed from grave to gay within the compass of one work; but the art of constantly showing two natures within the small limit of perhaps three ballad-verses was reserved for Heine. No one like him understands how to build up a little edifice of the tenderest and most refined sentiment for the mere pleasure of knocking it down with a last line. No man like him approaches his reader with a doleful countenance, and pours in the ear a tale of secret sorrow, and when the sympathies are enlisted, surprises his confidant with a horse-laugh." He ridiculed with merciless sarcasm the very democracy of which he had been at one time the apostle and the martyr.

HEINECCIUS, Johann Gottlieb, one of the most learned jurists of Germany, was born at Eisenberg in Saxony, Sept. 21, 1681. His life is totally unmarked by any event or incident of importance. He held a chair first of philosophy and afterwards of law at Halle, from which in 1724 he was transferred to a similar chair at Franeker in West Friesland. He next migrated to Frankfort-on-the-Oder, where he remained till 1733, when he once more resumed his professorship at Halle, where he died in 1741.

A list of his numerous works will be found in the *Bibliothèque Germanique*, tom. ii., part 1st. The principal are—*Fundamenta styli cultioris una cum Sylloge exemplorum*, Halle, 1719, in 8vo; *Elementa Philosophiæ Rationalis et Moralis, quibus præmissa Historia Philosophica*, Francfort, 1728, in 8vo; *Antiquitatum Romanarum Jurisprudentiam illustrantium Syntagma juxta seriem Institutionum Justiniani*, Halle, 1718, in 8vo; *Elementa Juris Naturæ et Gentium*, Halle, 1738, in 8vo; *Prælectiones Academicæ in* H. Grotii *de Jure Belli ac Pacis libros*, Berlin, 1744, in 8vo; *Prælectiones Academicæ in* Sam. Puffendorf *de Officio Hominis et Civis*, ibid. 1742, in 8vo; *Historia Juris Civilis Romani ac Germanici*, Halle, 1735, in 8vo; *Elementa Juris Civilis secundum ordinem Institutionum*, Franeker, 1725, in 8vo; *Elementa Juris Civilis secundum ordinem Pandectarum*, Francfort, 1756, in 2 vols. 8vo; *Elementa Juris Cambialis*, Amsterdam, 1743, in 8vo. The works of Heineccius were collected and published by Uhl, professor at Frankfort-on-the-Oder, under the title of *Opera ad Universam Jurisprudentiam, Philosophiam, et Litteras humaniores pertinentia*, Geneva, 1744–48, in 8 vols. 4to, reprinted in the same city, with additions, 1771, in 9 vols. 4to; and to these two editions a supplementary volume was at the same time added. After the works of Cujas, this collection is perhaps the most valuable and necessary to a student of jurisprudence. The commentary of Heineccius on the Julian and Papian laws would alone suffice to place him in the rank of the greatest jurisconsults; and if his authority has decreased somewhat in Germany, which we believe to be the case, it is because his successors, profiting by his researches, have been enabled to surpass him. We are also indebted to Heineccius for editions of the *Jurisprudentia Romana et Attica*, Leyden, 1738, in 3 vols. folio, with a learned preface prefixed to the first volume.

HEINSIUS, Daniel, a distinguished Dutch scholar, was born at Ghent, of a noble family, in 1580. The Low Countries were then distracted by civil wars, which compelled his father to fly with him for safety to England. After a short residence in that country, the family returned home, and the young Heinsius was sent to Franeker to study law. He soon exchanged law for Greek, however, and removed from Franeker to Leyden to enjoy the tuition of Joseph Scaliger. After holding some minor appointments at that university, he was made professor of politics and history at the age of twenty-five, and, on the death of Paul Merula, librarian and secretary of the university. His editions of the classics made him so famous that his services were courted by nearly every crowned head in Europe, but he steadily refused to leave his country, whose historiographer he had now become. In 1618 he acted as secretary to the synod of Dort, having already distinguished himself in the theological controversies of the day. In his later years he suffered greatly from the failure of his memory. He died Feb. 23, 1655. His works consist of—Editions of the Greek and Latin classics, or works of criticism connected with them, amounting to eighteen in number—Latin poetry, particularly *Iambi; Auriacus*, a tragedy; *Herodes Infanticida*, also a tragedy; *De Contemptu Mortis*, a poem in four books; fugitive pieces under the titles of *Extemporanea* and *Juvenilia*, and some Greek poems; Latin harangues, which have been collected under the title of *Orationes Varii Argumenti*, Leyden, 1615, 1620, in 12mo; *Rerum ad Sylvam Ducis atque alibi in Belgio aut a Belgis anno* 1629 *gestarum Historia*, Leyden, 1631, in folio. (J. B—E.)

Heinsius, *Nicolas*, was the son of Daniel Heinsius, and obtained nearly equal eminence with his father as a scholar. He was born at Leyden in 1629, and was educated there by his father, as well as by Grotius, Gronovius, and other celebrated scholars. In 1642 he visited England previous to commencing a literary tour through France, Italy, and Sweden. In 1659, on the invitation of Queen Christina, he settled at Stockholm, and remained there till his father's death in 1655 recalled him home. After his return to Sweden he was in 1667 sent as ambassador to the Czar of Moscow, from which he returned with broken health and spirits. The remaining ten years of his life he spent for the most part in Holland, and died at the Hague, October 7, 1681. His principal works were his *Claudian*, with notes, Leyden, 1650, in 12mo, and Amsterdam, 1665, in 8vo; *Ovid*, with notes, ibid., 1652, 1661, 1668, in three vols. 12mo; *Virgil*, without notes, Amsterdam, 1676, and Utrecht, 1704, in 12mo; *Valerius Flaccus*, without notes, Amsterdam, 1680, in 12mo; Remarks on Silius Italicus, Petronius, and Phædrus; A great number of Letters, which may be found in the *Sylloge Epistolarum* of Burmann, in 5 vols. 4to; *Poemata*, the best edition of which is that of Elzevir, Amsterdam, 1666, in 8vo, dedicated by the author to the Duke of Montausier. Peter Burmann the younger also published *Nic. Heinsii Adversariorum, libri v.*, followed by the notes of Heinsius on Catullus and Propertius; and the same author also cites inedited notes of Heinsius on Tacitus, on the dialogue *De Claris Oratoribus*, and on the *Catalecta veterum Poetarum*.

HEIR-AT-LAW, is a person who succeeds to another by descent. Both in England and Scotland, estates, in the absence of a different special destination, descend to heirs in the direct line, however remote. The exclusion of parents, until the extinction of all descendants, both direct and collateral, is almost peculiar to the laws of these kingdoms. By the Jewish law, on the failure of issue, a father succeeded to his deceased son, to the exclusion of the son's brothers, unless one of them married and had issue by his widow. By the Roman law, on the failure of children or lineal descendants, the father and mother, or other lineal ascendants succeeded, together with the deceased's brothers and sisters. As a consequence, however, of the feudal system in Britain, a landed estate descends to sons, in the order of their seniority—the issue of the elder son always excluding the immediate younger son, and so on through the whole sons. It is only in default of such issue that daughters succeed, and then they succeed equally. The children of a deceased child in the order now mentioned, represent the parent, and exclude all relatives which such deceased parent, if surviving, would have excluded. By this rule the son of an eldest son, and failing him and his issue, the daughters of an eldest son, equally among them, and their descendants, exclude the other sons and daughters of the ancestor, and so on through all the ancestor's children. On the entire failure of lineal descendants, the estate goes to collateral heirs—that is, the ancestor's immediate younger brothers in the order above mentioned, and their issue; failing whom it goes to his sisters equally and their issue. On the entire failure of collateral descendants, it goes to the ancestor's father, then collaterally to the ancestor's uncles and their descendants; whom failing, to his aunts (the latter equally) and their descendants. It is only on the failure of all these, that the succession opens to the grandfather, and next to his relatives. There is no succession by or through the mother, unless the estate came from her. In Scotland where an estate is not acquired by inheritance, it is called conquest; and in all competitions among brothers or uncles, or their descendants regarding conquest, it is not the immediate younger brother or uncle, as in heritage, who succeeds, but the immediate elder brother or uncle.

Heir *by Destination*, sometimes called "heir of provision," is a person called to succeed by the will of the proprietor, either directly, or on the failure of persons to whom the estate is primarily conveyed. Any absolute proprietor executing a conveyance of his estate, can regulate the order of succession; but unless the specified destination be protected and enforced by certain legal prohibitions and re-

Heir-apparent
||
Helena.

straints, attention to which require all the skill of the practised conveyancer, a hope of succession is merely created, which may be defeated by each heir as he enters on the possession.

Heir-*apparent* is a person so called in the lifetime of his ancestor, whose right of succession is indefeasible, provided he outlive the ancestor; as the right of the next heir to the throne, or to an estate under a deed of entail, or under the marriage-contract of his parents.

Heir-*presumptive* is one who, if his ancestor should die under existing circumstances, would be his heir, but whose right of succession may be defeated by various contingencies, such as the subsequent existence of a nearer heir, even though by posthumous birth, or the special conveyance of the estate by the ancestor to a different person.

HELDER, a fortified seaport town on a projecting tongue of land at the N. extremity of North Holland. It is separated by the Mars diep from the island of Texel, and stands 40 miles N. W. of Amsterdam. It commands the Mars diep, the channel to the Zuider Zee. East of the town is the fine harbour of Nieuwe diep, accessible to the largest ships. It is connected with Amsterdam by the Helder Canal, by means of which the largest merchant vessels reach Amsterdam without encountering the difficult navigation of the Zuider Zee. This canal is 50 miles in length, 125 feet broad at the surface, and 21 feet deep. The Dutch admiral, Van Tromp, was killed in an engagement off Helder in 1693. It was taken by the British under Sir Ralph Abercrombie in 1799. Pop. about 2900.

HELENA, the daughter of Leda (wife of Tyndareus, king of Sparta), and of Jupiter, who, under the form of a swan, had obtained the favours of the queen. In consequence of this amour she produced two eggs, from one of which sprang Castor and Clytemnestra (both mortal, as being children of Tyndareus), and from the other Pollux and Helena, who were considered immortal, as the offspring of Jupiter.

From her infancy she possessed that dazzling beauty which became in the course of time so fatal to her admirers. About the age of ten she was carried off by Theseus, who concealed her at Aphidnæ, in Attica, under the protection of his mother Æthra. She was rescued by her brothers, Castor and Pollux, who discovered her place of concealment by means of Academus. They carried off at the same time Æthra, who henceforth remained the captive slave of Helen. This adventure did not prevent her from being sought in marriage by all the young princes of Greece. The most celebrated of her suitors were Menelaus, Diomede, Philoctetes, Idomeneus, Merione, Amphilochus, Patroclus, the two Ajaxes, Teucer, Antilochus, Ulysses, with others to the number of thirty. Her father, Tyndareus, was alarmed at the number of her suitors, believing that the preference he showed to one would bring on him the displeasure of all the rest. He was relieved from this dilemma by Ulysses, on condition he should receive the hand of his niece Penelope in marriage. His advice was to bind all the princes by an oath that they would yield implicitly to the will of the princess, and that they would unite to defend her if any attempt should be made to carry her off from the arms of her husband. The rivals consented, and Helen decided in favour of Menelaus, who thus became the heir apparent, and soon afterwards possessor, of the throne of Sparta. By her he had a daughter, Hermione, and two sons, Morrhaphius and Diethus.

Venus had promised to Paris the possession of the most beautiful of women. At her instigation, he proceeded to Sparta during the absence of Menelaus, and succeeded in gaining the affections of Helen, and in inducing her to quit her husband and her country. It was in vain that Menelaus sent to Troy to demand back his wife, in vain that the sons of Atreus threatened that all Greece would march against Troy. During the celebrated Trojan War she remained faithful to Paris, and had by him Bunichus, Agane, Idæus, and Corythus. On the death of Paris she married Deiphobus, the bravest of the sons of Priam after Hector; and on the taking of Troy, she is said to have betrayed him in order that she might ingratiate herself with Menelaus. It appears that Menelaus forgave her, and that they proceeded on their way to Sparta, where, according to some, they did not arrive till the space of eight years had elapsed. Here they received the visit of Telemachus, who had been sent by his mother in search of his father Ulysses. And here the legend of Homer ends. According to Euripides, she was killed by Orestes, her son-in-law, or she was banished by her step-sons, Megapenthes and Nicostratus, when she retired to the island of Rhodes, where she was suffocated in a bath.

Helena, St.

Helena, *St*, the mother of the Emperor Constantine, was born of humble parents in Bithynia. The place of her birth was the little town of Drepanum which her son afterwards raised to the dignity of a city, under the name of Helenopolis. Reasons of state compelled her husband (Constantius Chlorus) to divorce her when he assumed the purple in A.D. 292; but she was amply compensated for this indignity by her son Constantine. After her conversion to the Christian faith, which seems to have been effected by her son, she made a pilgrimage to Jerusalem, where she is said to have discovered the Saviour's tomb, and the real wood of his cross. She exhibited so many virtues and so much Christian zeal and charity, that in due time after her death, which happened in A.D. 328, she was canonized by the church.

HELENA, St, an island in the S. Atlantic, belonging to Britain; S. Lat. 15. 55. 26.; W. Long. 5. 42. 30. It is about midway between Africa and South America, 1800 miles from the Cape of Good Hope, and 600 miles from the Island of Ascension. Its extreme breadth is 7 miles; and its greatest length 11 miles; its area is 30,300 English acres. The geology of St Helena is interesting. The island may be considered as the highest peak of a range of mountains traversing the S. Atlantic, and is most probably an extinct tertiary volcano. Geologists have been unable to fix with exactness its chronological position. The volcanic forces which have produced the complicated disturbances so conspicuous throughout the island, must have ceased at a very remote period, as it has evidently retained for ages its existing conformation.

The climate of St Helena, though within the tropics, is temperate and healthy, and not unfavourable even to European constitutions. In James' Town (600 feet above sea-level), the thermometer seldom rises above 80°; but in calm weather the heat reflected from the sides of the valley is often oppressive. In the open country the temperature is more uniform and mild, scarcely so hot and never so cold as in England. During some seasons the highest point of the thermometer during the summer has been only 72° in the interior; and the ordinary range during winter from 55° to 56°.

The soil of St Helena is clayey, and in many places of considerable depth. Vegetation is very luxuriant in the island, which is abundantly supplied with water from 160 excellent wells.

In some parts of the island iron ore has been found, but the scarcity of fuel prevents it from being smelted. Gold and copper have been observed in small quantities. Concrete limestone is excellent in quality and abundant. The hills are covered with furze and various indigenous shrubs and trees. Of the latter the most abundant is the gumwood, of which there are three kinds, the common, the bastard, and the dwarf gum-tree. Other native trees are stringwood, dogwood, redwood or ebony, and the cabbage-tree, of which the last two are very durable as building timber. Oaks, cypress, and pinaster, have been introduced into the plantations and thrive well. The ferns of St Helena are numerous, and the myrtle grows to the height of 30 feet. The cotton plant also thrives very well. Fruits ripen best in the valleys near the coast, but every farm produces in abundance the common fruits and vegetables both of the tropical and temperate zones. The attempts to grow cereals have not succeeded. Of the 756 species of plants now found in the island only 52 are natives. The cattle, sheep, and goats on the island are of English origin.

The greater part of the surface of St Helena is waste-land; but about 160 acres have been reclaimed and brought into cultivation, 7000 improved as pasture ground, and 28,000 are suitable for grazing sheep and goats. Such roads as exist are wretched.

In 1851 the total revenue of the island was L.17,177, and total expenditure L.16,427.

The supreme authority is vested in a governor, and a council composed of the lieutenant-governor, colonial-secretary, and chief-justice. When the council is not assembled the whole authority of the board centres in the governor.

St Helena was discovered by the Portuguese in 1501. They succeeded in concealing the position of St Helena from other European nations till 1588, when it was descried and visited by Captain Cavendish on his way home from a voyage round the world. Soon after this it became well known to the Dutch and Spaniards. In course of time it was abandoned by the Portuguese, and taken possession of by the Dutch, who in turn abandoned it on the establishment of their colony at the Cape of Good Hope in 1651. On their departure the English East India Company formed a settlement upon St Helena, and about ten years afterwards obtained from Charles II. a charter for its possession. In 1665 the Dutch successfully attacked the island, but in a few months were driven out of it by the English. Again, in 1672, the Dutch recaptured it, through the treachery of the planters; but it was almost immediately recovered by an English squadron, under Captain Munden, and again restored to the East India Company. As the trade of the East India Company increased, the importance of the island became daily more apparent.

But the chief historical interest of St Helena centres in Longwood House, the residence of the exiled Emperor Napoleon from 1815 till his death, May 5, 1821. The house in which the Emperor lived has been allowed to fall gradually into decay ever since his body was removed to France in 1841. (Brooke's *History of the Island of St Helena;* Johnson's *Account of St Helena;* Beatson's *Tracts relative to the Island of St Helena,* &c.)

In 1805, the pop. was 3078; in 1823, 4381 (composed of 1201 whites, 911 in the civil and military establishments, 1074 slaves, 729 free coloured, 442 Chinese, and 24 Lascars); in 1839, 4205; in 1849, the total military force amounted to about 1500 regular troops, besides four volunteer companies of white and black militia. Soldiers are sometimes placed at St Helena to undergo a seasoning previous to being sent to India; and this island and the Cape of Good Hope are the principal stations to which captured slaves are brought, and employed in public works.

HELENSBURGH, a burgh of barony, and a fashionable watering-place, Dumbartonshire, Scotland, on the Firth of Clyde, opposite Greenock. Pop. (1851) 2841.

HELENUS, one of the sons of Priam and Hecuba. He distinguished himself during the Trojan War by his valour, and by the gift of prophecy which he possessed. He became the captive of Ulysses, who afterwards made him over to Neoptolemus, the son of Achilles. When Neoptolemus returned home, he took his prisoner with him, and assigned Andromache to him as his wife. Helenus afterwards became king of a part of Epirus, and was visited there by Ænæas while on his way to Italy.

HELIACAL, a term applied to a star or planet, with reference either to its emergence from the light of the sun, or immergence into it. A star is said to rise heliacally when, after being in conjunction with the sun, it gets at such a distance from it as to become visible before sun-rising. The heliacal setting of a star denotes its entering into the sun's rays, and thus becoming lost in the superior splendour of that luminary.

HELIADES. See PHÆTHON.

HELIÆA, the chief law-court of Athens, at which state-offences were tried, and which was probably presided over by the Thesmothetæ.

HELICON, in *Ancient Geography,* a celebrated mountain range in Bœotia, lying between the Lake Copais and the Corinthian Gulf. It was the fabled abode and favourite haunt of the muses, thence called Heliconides and Heliconiades. On the hill-side was a grove sacred to these deities, not far from which was the celebrated fountain of Aganippe. About twenty stadia from this same grove was the still more famous fount Hippocrene (horse's well), said to have been made by the foot of the winged horse Pegasus. The mountain is nearly equal to Parnassus in circumference, but not much more than half as high. Its highest peak, Paleovuni, is rather less than 5000 feet in height, while Parnassus is more than 8000. The eastern slopes of Helicon are well-watered and fertile, and produce a great variety of trees and fruits. Those on the western side are less productive.

Helicon owes its celebrity chiefly to its poetical associations; and it became famous in Greek poetry, from its neighbourhood to Ascra, the birth-place of Hesiod, the first and greatest poet of his class, who was born in Greece Proper.

HELIER, ST, the capital of Jersey; N. Lat. 49. 11., W. Long. 2. 6. It is situated on St Aubin's Bay, on the S. coast of the island, between two rocky heights, on one of which stands Fort Regent, an irregular fort of great strength, erected in 1806, at a cost of L.800,000. The fortress of Elizabeth Castle, capable of containing 600 men, stands on a small rocky island, which, though about a mile from the shore, is accessible at low water by a long natural causeway. The port is large, and consists of an inner and an outer harbour, the latter completed in 1846. The town of St Helier is rapidly extending; and in the outskirts there are many handsome villas. The court-house in the Royal Square is a plain structure erected in 1647. In it the "states assembly" hold their meetings. The parish church was built in 1341. The theatre is a neat building, with a light portico. St Helier has a public library and reading-rooms, baths, savings bank, hospital, and several other benevolent institutions. Shipbuilding is extensively carried on. The cheapness of living has induced many persons of limited means to settle here. Pop. (1851) 29,133.

HELIGOLAND, properly HELGELAND, *i.e.,* HOLY LAND, a small cluster of islets belonging to Great Britain in the German Ocean, about 25 miles off the coast of Holstein, and about the same distance from the mouth of the Elbe. The group consists of Heligoland (which gives name to the whole cluster), Sandy Island, and a great number of banks, reefs, and uninhabited cliffs, of which latter the largest is called the Monk. The islet of Heligoland is only about three miles in circumference. It consists of two distinct parts, the low ground and the rock. The latter, which rises with an almost perpendicular abruptness to the height of between 150 and 200 feet above the sea, consists of a reddish sandstone, and has a very striking aspect from the sea. The flats at its foot produce a little corn, and are chiefly valuable for the excellent double harbour which they present. To the east of them is an excellent roadstead, well sheltered, and capable of accommodating the largest vessels. Heligoland is said to have been at one time much larger than it is now; and Sir C. Lyell, in his *Principles of Geology,* endeavours to prove, that since the year 800 it has been gradually crumbling away before the action of the currents. Portions of the island, it is quite true, have been swept away; but it has also been thought that the famous map by Meyer, which exhibits the island as containing nine parishes, &c., is a mere fiction. A comparison of the oldest extant maps of good authority shows, that the amount of destruction for the whole circumference in the course of a century does not exceed three feet. The people of Heligoland live chiefly on the rocky part of the island; a few fishermen only inhabiting the flats. The native inhabitants support themselves principally by fishing and piloting. Though the island has been in possession of the English since 1807, there are almost no English residents except the governor and his suite, and the garrison. During the great continental war, however, when Heligoland became the depôt of a vast quantity of merchandise, which was thence smuggled into the Continent, the population rose to upwards of 4000, and the commercial interests of the place became very considerable. A lighthouse and batteries have been erected by the English for the protection of the island and shipping. Heligoland was anciently inhabited by the Frisii, and it is believed that the famous temple of the Frisic god Fosete stood on the island. This temple was destroyed in the eighth century, at the time when the inhabitants embraced Christianity. The existing natives speak the language of the old Frieslanders, whose customs, manners, and dress, they have also retained with slight modifications. Pop. about 2300.

HELIODORUS, the first and best of the Greek romancers, was born at Emesa in Syria, and flourished under Theodosius at the close of the fourth century. Nothing is known of his personal history, except that he became bishop of Tricca in Thessaly, and compelled every married priest in his diocese to put away his wife as soon as he applied for ordination. His famous romance, the *Æthiopica*,—so called, because the scene is laid in Æthiopia,—narrates the loves of Theagenes and Chariclea. The work is interesting, both because it exhibits the first germs of the great modern art of novel-writing, and because the story as a story has very considerable merit. The adventures are, perhaps, too numerous; and, besides following in too rapid succession, are occasionally rather improbable; yet both the main plot and the episodes are well managed, the characters are well drawn, and the scenery is well described. The language, too, though somewhat deficient in point and terseness, is natural and pleasing. The *Æthiopica* was not known to modern scholars except by repute, till the sack of Ofen in 1526, when a MS. copy from the library of Matthew Corvinus fell into the hands of a German soldier, who carried it off with him into his own country. It passed into the hands of Obsopæus, by whom it was printed at Basle in 1538. Other MSS. were discovered, and new and more correct editions followed. The most recent is also the best—that of Coraës, Paris, 1804.

HELIOMETER (ἥλιος, *sun*, and μέτρον, *measure*), the name given by Bouguer, to a kind of double-image micrometer for measuring the diameters of the stars, and especially those of the sun and moon, or any small apparent distance between the heavenly bodies. Mr Savary of Exeter communicated to the Royal Society, in the year 1743, an account of a double-image micrometer, from which the *heliometer* proposed by Bouguer, five years afterwards (1748), does not differ in construction. This instrument is described under the head MICROMETER, in which the various improvements it has received are given in detail.

HELIOPOLIS, *i.e.*, the city of the sun, in *Ancient Geography*, a town in Lower Egypt, on the right bank of the Pelusiac branch of the Nile, not far from the point where it diverges from the main stream. See EGYPT.

HELIOPOLIS, the classical name of Baalbec in Syria. See BAALBEC.

HELIOSTAT, in *Optics*, the name given by s'Gravesande to an instrument devised by him for the purpose of fixing, as it were, the solar rays during the whole time of observation—namely, by reflecting them in the same straight line by a mirror, to which a proper motion is given by means of clockwork. The original instrument is described in his *Phys. Elementa Mathematica;* but it has been greatly improved by Malus and others.

HELIOTROPE (*heliotropium*), amongst the ancients, an instrument or machine for showing when the sun arrived at the tropics and the equinoctial line. This name was also used generally for a sun-dial.

HELIOTROPE, a siliceous mineral of a dark green colour, and variegated commonly with bright red spots, whence it is called *hæmatite*, or *bloodstone*. See MINERALOGY.

HELIOTROPE, a genus of plants of the nat. ord. *Ehretiaceæ. H. peruvianum* and some other species are much cultivated on account of their fragrance.

HELIX (ἕλιξ, *a wreath* or *winding*), a spiral line. In architecture, some authors make a difference between the helix and the spiral. A staircase, according to Daviler, is helical when the steps wind round a cylindrical newel; whereas the spiral winds round a cone, and is continually approaching nearer and nearer its axis. This term is also applied to the caulicules or little volutes under the flowers of the Corinthian capital.

HELLANICUS, of Mitylene, the best of the old Greek logographers, lived and wrote in the fifth century B.C. His exact era is not known; but the best authorities place the date of his birth in B.C. 496, and of his death in B.C. 411. Nothing is known of his personal history except that he died at Perperene, a town of Mysia, opposite the island of Lesbos. His works, which were very numerous, and are frequently alluded to in the classics, are only known to us from the fragments that still survive. They seem to have comprised treatises on mythology, history, and chronology. Of these the most important were his *Atthis*, or History of Attica from the remotest times; his *Æolica*, *Persica*, and *Junonis Sacerdotes.* This last-mentioned work is a History of Argos arranged chronologically according to the succession of the priestesses of Juno in the great temple in that city. It contains, however, besides mere dates, a number of traditions and historical events which were afterwards turned to account by Thucydides. Hellanicus was the first Greek who can be said to have even tried to rise above the method of the old logographers, and his success is very partial. His histories are not so much separate works as detached and isolated fragments of the same work, which he had not the skill to work up into an harmonious whole. Thucydides censures his chronology as incorrect. The fragments of Hellanicus have been published by Sturz, Leipzig, 1787; and again in 1826 in the *Museum Criticum;* and in Müller's *Fragmenta Historicor. Græc.*

HELLANODICÆ, in *Grecian Antiquity*, the chief judges at the Olympic games. They were chosen by lot from the whole body of the Elean people, to whom the entire management of the festival belonged. They were originally only two in number, but were afterwards increased to nine, three of whom superintended the horse-races, three the pentathlon, and three the other sports. A tenth judge was next added, and in the 103d olympiad, when the Elean phylæ were twelve in number, the judges were next increased to twelve, one being chosen from each phyla. In the war between the Eleans and the Arcadians (104th olymp.) the former lost a considerable extent of territory, and the hellanodicæ were reduced from twelve to eight. A few years afterwards, however, their number was increased to ten, and remained unchanged till the time of Pausanias, from whom most of our information on the subject of these umpires is derived. For ten months before the games began the hellanodicæ were trained in their duties by certain Elean magistrates entitled nomophylaces. Their duties, which only lasted over one festival, consisted in seeing that the laws were strictly observed by the competitors and others who took part in the games, in adjudging the prizes, and awarding them to the victors. The hellanodicæ were held in high esteem in virtue of their office, and were allowed to wear a handsome uniform. The best seats at the games were also reserved for them. All the details of the arrangements were controlled by them.

HELLAS. See GREECE.

HELLE, in *Grecian Mythology*, was the daughter of Athamas, king of Thebes, and the goddess Nephele, whom he had married at the command of Juno. Athamas, however, secretly loved the mortal Ino, and at last took her to his home as his wife. Dissensions, of course, sprang up between the wives and their respective families. Athamas went to Delphi to consult the oracle as to the best means of restoring domestic harmony. Ino bribed the priestess, and Athamas was told that it would be necessary to sacrifice Phrixus, the brother of Helle. Thereupon Nephele and her two children fled for safety towards Asia on the back of the ram with the golden fleece. Helle, however, had the misfortune to slip off its back, and the strait into which she fell was called in her honour, *Helles Pontus* or *Hellespont*, the Sea of Helle. Phrixus, after burying his sister, held on his way to Colchis.

HELLEBORE (*helleborus*), a genus of plants of the nat. ord. *Ranunculaceæ*, all of which possess very active purgative qualities. (See BOTANY.) The *black* hellebore was a famous remedy among the ancient Greeks and Romans, especially in mania: and so prevalent was the belief in its efficacy in imparting clearness to the mental faculties, that the most celebrated philosophers used to prepare themselves for intellectual labour by drinking an infusion of the leaves of this plant. The best grew in the island of Anticyra in the Ægean Sea, and the gathering of it was accompanied with superstitious observances.

HELLENISMS are idioms transferred from the vernacular into the Greek by the writers of the New Testament.

HELLENISTS (*Hellenistæ*), a term occurring in the Greek text of the New Testament, and which in the English version is translated Grecians. The authors of the Vulgate, indeed, render it *Græci;* but the Port-Royalists, more accurately, *Juifs-Grecs*, Grecian Jews—that is, Jews who spoke Greek, and who are thus distinguished from the Jews called *Hebrews*, who spoke the Hebrew tongue of that time. The Hellenists, or Grecian Jews, were those who lived in Egypt and other parts where the Greek tongue prevailed. It is to the Hellenists that we owe the Greek version of the Old Testament, commonly called the Septuagint. The Hellenists are properly distinguished from the *Hellenes* or Greeks, mentioned in John xii. 20, who were Greeks by birth and nation, and yet proselytes to the Jewish religion.

HELLESPONT. See HELLE and DARDANELLES.

HELLIN (anciently *Ilunum*), a royal town of Spain, in the province of Murcia, and capital of a cognominal department in the bishopric of Cartagena. It lies on the slope of the Sierra de Segura. The parish church is very elegant, the masonry and marble pavement at the entrance being worthy of special notice. Near Hellin are the mineral baths of Azaraque; and the celebrated sulphur mines, at a distance of twelve miles, are under its jurisdiction. Hellin was sacked by the French under Montbrun; and was the point where Joseph and Soult united with Suchet after Marmont's rout at Salamanca. The industry of Hellin is chiefly confined to the manufacture of earthenware, linens, cloths, hats, flour, oil, and chocolate. Pop. 8818.

HELMET, a piece of defensive armour for the head. In heraldry the helmet is placed over a coat-of-arms as its chief ornament; and, according to its form, position, &c., marks the quality or dignity of the bearer. See HERALDRY.

HELMINTHOLOGY.[1]

(ANNELIDA.)

THE title of this article was formerly bestowed on a much larger group of animated beings than that to which it has been here restricted. The Linnæan group of *Vermes* contained, in fact, the whole of the intestinal and other worms, the molluscous and testaceous tribes, the Zoophytes and Infusoria—which now form the natural materials of many classes. We here apply it exclusively to the ANNELIDA, or red-blooded vermes, of which the medicinal leech and earth-worm afford familiar examples. Bruguière and others have no doubt conjoined them, in comparatively recent times, with the intestinal tribes; and it was at one time our intention (see ANIMAL KINGDOM, § *Divisions*) to have adopted that arrangement. But we conceive it to be more in accordance with the principles adopted in our other systematic articles, to abide by the example of Cuvier, and, referring the latter to the radiated or zoophytical division, to include in the article HELMINTHOLOGY the Annelida alone. In truth, the intestinal tribes exhibit no organs of respiration, either tracheal or branchial—no traces of a true circulation—and their nervous system is extremely obscure. It will therefore become apparent, from the following definition, how greatly the Annelida differ from the creatures just named.

The Annelida or red-blooded worms form the first class of the articulated or annulose division of the animal kingdom.[2] Their blood, of a red colour, resembling that of the vertebrated animals, circulates in a double system of closed vessels, that is, in arteries and veins. This system, though destitute of a heart properly so called, is sometimes provided with one or more distinct fleshy ventricles. Respiration is carried on through the medium of organs, which are sometimes external, occasionally developed beneath the surface of the skin, or sunk more deeply into the interior. They may all be presumed to breathe by means of branchiæ, although the respiratory system of the so-called Abranchial Order is still in some respects obscure. The branchiæ or respiratory organs of the greater number are external, and vary considerably in their size, form, number, and position. Their body, of a softish texture, is more or less elongated, and always divided into numerous rings or segments, of which the anterior, known under the name of head, scarcely differs from the others, except by the possession of a mouth, and of the principal organs of the senses. None of the Annelida possess articulated members properly so called, but in room of these many are furnished with setiferous mammillæ, or fleshy projections, bearing bundles of hairs or bristles, and forming what may be called *pedes spurii*, of which the number is extremely various. These peculiar organs are sometimes composed of two parts, the one superior and dorsal, the other inferior and ventral. The muscular power resides in the interior, and is capable of producing only an undulatory or creeping movement—

---

[1] From ἑλμινς, *a worm*, and λογος, *a discourse.*

[2] For a description of these primary divisions of the animal kingdom, see ANIMAL KINGDOM, § *Third Primary Division.*

the locomotive parts being incompetent to sustain the body. The organs of the mouth consist sometimes of parts resembling jaws, more or less developed, sometimes of a simple tube. The organs of the external senses are composed of fleshy tentacula, sometimes articulated, and of certain blackish points, not existing in all the species, regarded as eyes. The nervous system consists of a double ganglionic cord, analogous to that of insects, as already described in our art. ENTOMOLOGY. In regard to their natural habits, most of these creatures are aquatic (the Lumbrici or earthworms excepted), and a great majority marine. Some dwell in holes beneath the waters, others form tubes or tunnels of mud or other matters, or even transude from their own bodies a calcareous secretion, which forms around them a protecting covering.[1] Considered sexually, they are for the most part hermaphrodite, and some require reciprocal communication.

It will be perceived, even from the preceding brief exposition, that the Annelida are animals of a very peculiar nature. Although their nervous system coincides with that of the other articulated classes, and although their bodies are likewise divided by transverse sections, yet their locomotive organs are entirely dissimilar to those of the Crustacea, Arachnides, and Insects. Their setiferous mammillæ are merely retractile sheaths; and the hairs or bristles which they inclose are in no way comparable to the feet of the last-named classes, but are organs of a very different nature.

The Annelida are few in number compared with insects and other articulated classes, and the greater proportion are marine. Their possession of red blood is a singular character in animals so low in the scale, and one not possessed by the molluscous tribes, which are yet regarded as their superiors in other points of organization. Some peculiarities in the circulating fluids of these creatures have been recently described by Dr Williams.[2] With the exception of one or two species, two distinct and separate fluid elements of nutrition exist in these creatures—one, consisting of the proper and true blood, is contained in closed vessels, and moving in a definite orbit, constitutes a well-marked *circulation;* the other is a liquid mass, filling the open space which, in all species, intervenes between the intestine and the integument, holding organic corpuscles in suspension, varying in different species, and performing irregular to-and-fro oscillations under the agency of the muscular contractions of the intestine and integuments. On these two fluids two separate physiological functions devolve, each essential to the maintenance of life in the Annelida. All the recesses and ramifications of the *general cavity of the body* in these animals communicate freely with each other, constituting thus one common space. This cavity is lined by a distinct membrane, which is obviously the anatomical analogon of the *peritoneum,* and is filled by a fluid which is unquestionably an organic fluid. Dr Williams adduces reasons for regarding it as physiologically allied to the chyle of the higher animals, and the containing cavity as the prototype of the *peritoneal.* This general splanchnic chamber he therefore names the peritoneal cavity, and its liquid the peritoneal fluid, or the chyle-aqueous fluid of the peritoneal cavity. As the peritoneal membrane of the Annelida is not vibratory, the oscillations of the fluid contents cannot be caused by ciliary vibration. This fact is regarded as distinguishing the class from the Echinodermata, of which, in all the species, the peritoneal space is richly lined with vibratile cilia. The real character of this fluid was till recently unknown. Its coagulating principle consists of fibrine, and there can be no doubt that the greater portion is composed of sea-water. In a few minutes after removal from the body of the animal, it throws down an unquestionable coagulum, like the clot of true blood. The organic corpuscles cohere into groups and masses, and sink with the clot. Mechanically and physiologically this fluid is immediately essential to the maintenance of life—mechanically, by preventing contact between the intestine and integument, thus favouring the circulation of the blood proper; and physiologically, by furnishing the pabulum out of which the latter fluid is perpetually renewed or reinforced. In the genus *Sabella* this peritoneal fluid is opalescent and thickly corpusculated; it does not change its colour with that of the true blood, since its colour is the same in those species which are distinguished by *green* blood, as in those of which the blood is red, although so generally charged with corpuscles. *Aphrodita aculeata* is an exception, and exhibits a fluid which, bearing no visible morphous substances, seems to depart but slightly from the standard of salt water. The physiological character of this fluid is unequivocally manifested in *Glycera alba,* in which it bears in great abundance *blood-red* flattened oval corpuscles, resembling those of the frog. This is the sole instance of an Annelid with coloured corpuscles in the peritoneal fluid. The blood proper in this species is so faintly red as to be nearly devoid of colour, and is quite incorpuscular.

That the basis of this fluid consists of sea-water is rendered almost certain by the following expedient. If it is collected in adequate quantities (say from *Arenicola* or *Terebella nebulosa*), and carefully filtered, and the clean liquor then submitted to evaporation, the crystalline products will be found identical with those resulting from the evaporation of simple sea-water. Dr Williams infers that this sea-water, under such circumstances, readily assumes the character of an *organic fluid*—that is, becomes *vitalized* with great facility by the solid organic elements contained in the peritoneal fluid. Whether the peritoneal fluid is organically capable of maintaining the nutrition of the solid structures of the system, cannot be directly proved; but it is scarcely susceptible of doubt, from the intricate manner in which the true blood-vessels afterwards coil in the midst of the fluid contents of the general cavity, that the former must absorb from the latter the elements from which the true blood is afterwards manufactured. It presents, in fact, according to our author, the same relation to the contents of the proper blood system of vessels as the chyle of the higher animals does to the true blood; the peritoneal fluid of the Annelida differing from the chyle of the mammalia only in the fact that the latter is contained in vessels, while the former rolls in a capacious chamber.

---

[1] "As to the external tube which the Chetopoda (by which term M. de Blainville denominates the setigerous genera of the class Annelida) often inhabit, although it is frequently sufficiently regular and solid, it cannot however in any manner be compared to the shell of the Mollusca, not even where there is the greatest approximation, as in *Dentalium* and *Siliquaria.* These tubes of the Chetopoda are always simple excretions from their body, which are by no means attached to it, and from which the animal may issue forth without dying immediately. We begin to observe something of this kind in the mucosity with which certain species line the hole hollowed in the mud or sand which they inhabit, as in the Arenicolæ, and some Lumbrici. This is analogous to the mucous pellicle of the tube of the Amphitritæ and the Sabellæ; but in the latter, surrounding this mucosity, is attached externally a stratum, more or less thick, composed merely of mud or very fine grains of sand, or, in fine, of debris, more or less thick, of shells and larger grains of sand. These tubes are constantly open at both extremities; there are also some of them more regular, which are completely calcareous. The double opening is a character whereby they are distinguished from tubular shells, the summit of which, on the contrary, is constantly imperforate. These tribes, however, appear constantly to grow, after the manner of tubular shells, by laminæ or strata extremely thin, placed inside of and out-edging one another. From this result striæ, marking the growth, more or less apparent outside; but we never remark longitudinal striæ on their surface, nor anything indicating the delicate working of the edges of a mouth, as in the Mollusca. This character alone might suffice to distinguish them from the true tubular *shells;* but to this we may add, that the constant perforation of the summit of the tube of the Chetopoda never allows the animal, in growing and advancing in its tube, to form partitions there, whereas in the tubular shells the reverse is invariably the case. A final character which distinguishes the tubes of the Chetopoda is, that they are adherent, and fixed flatly, through a greater portion of their extent, on foreign bodies, which never takes place with the tubular shells." (Griffith's edition of Cuvier's *Animal Kingdom,* vol. xiii., p. 58.) We may add, that the young of the shell-bearing Mollusca are always born with shells, because that part forms, in fact, a portion of their *skin;* but there is no doubt that the young Annelida are produced in an exposed condition, and afterwards proceed, by a voluntary effort, to form their protecting habitations.

[2] See his excellent and elaborate paper "On the British Annelida," published in the *Reports of the British Association* for 1851. London, 1852.

Although we are deeply indebted to M. Milne-Edwards for his ample exposition of the colour and distribution of the blood in the Annelida,[1] he appears to have overlooked, if not mistaken, its corpuscular or microscopic character. "Mais, du reste," he remarks, "examiné au microscope, ce liquide ne m'a pas semblé differer du sang des autres animaux sans vertèbres. Les globules qu'on y voit nager n'ont pas du tout l'aspect de ceux propres au sang des animaux vertébrés; ce sont des corpuscules circulaires, dont la surface a une apparence framboisée, et dont les dimensions varient extrêmement chez un même animal." Mr Wharton Jones has also figured and described these blood corpuscles as supposed to exist in the earth-worm and leech.[2] Now, Dr Williams, after the most careful and extended examination, states as follows:—

"*In no single species among the Annelida does the blood proper contain any morphic element whatever!* In all instances, without a single known exception, it is a perfectly amorphous fluid, presenting under the highest powers of the best microscope no visible corpuscles or molecules, or cells whatever; it is a limpid fluid variously coloured, as originally and correctly described by M. Milne-Edwards, in different species. No complete distinction into venous and arterial blood can be observed, and the plan of the circulation renders such a distinction only partially possible. In all cases the colouring matter is fluidified, and uniformly blended with the fluid mass of the blood; the colour therefore must be *developed* in the fluid mass, for there exist here no morphotic elements in the blood itself by which the separation of the coloured substances from the peritoneal fluid can be effected, unless indeed the parietes of the vessels of the blood-proper discharge this eclectic function. With one exception, namely, that of *Glycera alba*, in which they are red, the corpuscles of the peritoneal fluid are in all species destitute of colour. But it is not at all chemically impossible that the coloured ingredients may exist in this fluid in a colourless state, and that these ingredients, through entering into new combinations, may become brightly coloured after transition into the true blood. In consequence of the impracticable minuteness of the quantity, no direct chemical analysis of the blood in the Annelid can be executed. As to the colour, however, analogy removes all doubt that the red tinge is due to the salts of iron, and the green to those of copper. In those species in which the blood is light, yellow, opaque, or lymph-like, it does not follow that the salts of the coloured minerals are altogether absent; they may exist under colourless combinations. The physiologist cannot view with unconcern the question, which in this class of animals affects the mode in which the peritoneal fluid and the blood-proper stand related to each other. That the former is higher than the latter in degree of organization, no doubt can exist; but it is not quite clear that the true blood is reproduced out of the elements of the peritoneal fluid; since the vessels distributed over the parietes of the alimentary canal may take up some of the immediate products of digestion, before the latter exude into the general cavity of the body to mingle with its semi-aqueous contents. Nor can it be affirmed, from the evidence drawn from its composition, that the peritoneal fluid is unfitted to supply the means of nutrition to the solid structures, into the interior of which in every part of the body it intimately penetrates. It is more probable, because more in accordance with analogy, however, to suppose, that it is a manufactory in *itself;* that its corpuscles execute an office by which the mineral substances and proximate principles are vitally assimilated; that the corpuscular elements in the Annelida do in this fluid, what in the higher animals analogous bodies effect in the blood-proper. From these facts the physiologist may advisedly say thus much, that in these animals nature divides the vital fluids into two separate and distinct orders, on one of which the preparative and elaborative cell-agency devolves, on the other the work of solid nutrition. They prove with great clearness, that the corpuscular elements, either in the blood itself, or, as in this case, in some contributory fluid, are essential to the preparation of the blood-proper; for when in the zoological series, as in the higher articulata, this corpusculated fluid disappears, the blood itself becomes corpusculated; or when the peritoneal fluid, as in the Echinodermata, becomes *less organic*, then also morphotic elements are developed in the true blood. From these observations the inference may be further drawn, that between these two nutritious fluids there exists a definite physiological balance; that one is capable of absorbing or merging into the other, according as the observer ascends or descends the organic scale. The peritoneal system of fluid terminates at the standard of the insect, the true blood system traced downwards terminates at the Echinodermata."[3]

The swelling of certain portions of the body in progression may be regarded as due to the interior fluids. These are driven to a given point of the containing cavity, where they are momentarily imprisoned by the contraction of the *circular* integumentary muscles before and behind,—thus producing a bulging. The muscles of the integument are then excited to action, and the fluid is forcibly compressed forwards or backwards, in accordance with the direction of the muscular agency. This is the mechanical use of the chyle-aqueous fluids of the peritoneal cavity, the physiological purposes of which have been already explained. Almost all the Annelida are struck, as it were, by paralysis, when this fluid is made to escape from its cavity by a puncture through the external walls. The power of motion is immediately suspended, and the body becomes flaccid and passive. The peritoneal fluid is really the fulcrum on which all muscular action is based, and without it these creatures cannot make the required contractions with sufficient effect and precision. But this is not the only mechanical use which it affords. It prevents that injurious pressure amid the internal organs which might impede or arrest the circulation of the blood. In the leech tribe it is the fluid contained within the stomach that accomplishes this important object. "Nothing in the history of the Annelida," says Dr Williams, "can be conceived more wonderful than the mechanically perfect and facile manner in which *Linus longissimus*, a worm of many yards in length, performs the feat of locomotion, and that too over craggy and rugged rocks." Without the conjoined action of these internal fluids, the motor apparatus would be incapable of effort.

The Annelida, as a class, may be said to undergo, in their earlier stages, few, if any, metamorphoses. The young

Annelida.

Annelida.

seem at first to be entirely devoid of appendages, but the body does not in any instance exhibit those peculiar transmutations so observable in the growth of insects and crustacea.

In regard to the external parts, we shall here indicate a few of the most important,—premising, that the characters mentioned are not universal to the class, but rather confined to certain races. The head, in such as possess one, is a small anterior swelling, which bears the antennæ commonly so called, and the eyes, and is distinct from the first segment of the body. The Nereids of Linnæus are regarded by Latreille as the only Annelida of which the anterior segment merits the name of head, or possesses organs fit to be compared to eyes, more especially to those of the larvæ of insects. The eyes, where such exist, are simple, extremely small, and appear like blackish points. The organization of the mouth varies greatly in the different orders. The parts called maxillæ by Savigny are hard circumscribed parts, of a corneous or calcareous nature, to which Latreille does not accord the name of jaws. The latter author indeed seems to regard the Annelida as a suctorial rather than a masticating class. Most of them are of carnivorous habits, and live on the blood of other creatures. The trunk or sucker is a contractile fleshy portion, constituting the mouth, and containing the so-called jaws. The latter portions, however, being adherent to the inner coats of the sucker, which is itself nothing more than a prolongation of the œsophagus, can scarcely be regarded as genuine jaws.

Several tribes have their branchiæ uniformly spread over the extent of the body, or over its central portion, while others (and these usually dwell in tubes) bear those organs at their anterior extremity. In the erratic species, or such as are naked, and without fixed dwellings, they are usually disposed longitudinally along the sides of the body, there being one for each foot. Blood-vessels sometimes appear to spread into the setiform processes, and to convert them into respiratory organs.

We have already stated that Linnæus placed the Annelida in his almost unlimited class of Vermes,—a vast and by no means well-combined group, which the later labours of Otho Frederick Müller, Pallas, and other naturalists, failed to cast into a much more natural mould. The great Swedish naturalist separated the true Annelida from each other, placing one portion of the group in the order Intestina, and the other in that of Mollusca. In Cuvier's earliest work (*Tableau Elementaire*, &c., 1789), he restricted the class of worms to the Annelida and intestinal species, a mode of grouping previously practised by Bruguière in the *Encyclopédie Méthodique.* Subsequent investigations induced the French anatomist to raise the former to the rank of a separate class, which he named *Vers à sans rouge*, in a memoir read to the French Institute in 1802. On this same group Lamarck (*Extrait du Cours*, &c., 1812) bestowed the name of ANNELIDES,[1] which has since been very generally adopted. A slight disparity, however, still exists in the constitution of the class, in the works of Cuvier and Lamarck, the former including therein the genus Gordius, which the latter associates with the other Vermes.

But notwithstanding the valuable labours of these and other writers, the external structure of the Annelida cannot be said to have been at all rigorously determined, or viewed in relation to that of conterminous groups, till we received the fruits of Savigny's laborious and most delicate observations, originally presented to the Academy of Sciences.[2] At that period Blainville was also occupied in the study of the same group, which, with the exception of the leeches, forms his class of *Sétipodes.* He published an extract from his labours in the course of the ensuing year.[3] Oken, Leach, Latreille, Dugés, Audouin, Milne-Edwards, and others, have likewise contributed to our knowledge of this curious and important class, in publications, to the majority of which we shall more particularly allude in the course of the present treatise.

In regard to the geographical distribution of the Annelida, our data are not yet sufficiently precise and numerous to admit of any satisfactory generalization. We have already said, that with the exception of the earth-worms (and even these require a moist abode), all the *known* species are aquatic. We may add, that the great majority inhabit the saline waters of the ocean. Most of the Naids, however, occur in fresh water, and some true Nereids are found in the lakes of North America. Annelida of some kind or other are met with in all quarters of the globe, and the species of many genera are very widely distributed; but others, such as the *Amphinomæ*, for example, are characteristic of, if not peculiar to, the warmer seas. Undoubtedly the most magnificent are native to the Indian shores. "It is in general on the coasts of the sea, in the midst of Thalassiophytes, in the anfractuosities of madrepores, in the sand, and particularly in mud, that the Chetopoda are to be found; and if some species are more commonly to be met with in the open sea, as, for instance, the Amphinomæ, named by M. Savigny *Pleione vagans*, it appears that they may have been drawn along with marine plants by the currents, as is the case with many other animals."[4] Their natural movements are extremely slow, and may be compared to those of slugs, although their appendages for locomotion are much more numerous. The Nereides, however, not only creep in a kind of serpentine manner over the surface of solid bodies at the water's edge, but frequently swim very respectably, either by successive undulations of the body, after the manner of eels and serpents, or by agitating their appendages, and thus making these organs serve as oars.[5]

The utility, in an economical point of view, of the Annelida in general, to the human race, is by no means great. According to Pallas, the inhabitants of some parts of Belgium eat those portions of *Aphrodita aculeata* which compose the mouth; the Nereides and Arenicolæ, as well as the earth-worms, are extensively employed as baits for fish, and the medicinal uses of the leech are notorious; but, with these, and, it may be, a few other exceptions, little can be said regarding the direct benefits derivable from this peculiar class. Its subjects, however, are by no means on that account the less important in the eyes of the philosophical naturalist.

Several of the Annelida possess a phosphoric property, from which Linnæus named a certain species Nereis *noctiluca.* Others, characterized by the same attribute, were afterwards described by Sig. Viviani.[6]

---

[1] From *annellus*, a little ring. The body of these animals is composed of a series of annuli or rings, a formation which suggested to Lamarck the general name which they now bear. The substance of these rings is neither horny nor calcareous, but soft and fleshy, and thus so far differs from the truly articulated tribes in the entire absence of any approach to a hard skeleton, or the consistent covering of insects. The segments are divided from each other only by a circular band of muscular fibres, the annulations not being perfectly distinct from each other,—the longitudinal muscles passing over and under the constricting circular bands. Thus, as Dr Williams remarks, these segmentations of the Annelida are more apparent than actual. In addition to the works mentioned in the course of this article we would especially recommend Dr Williams' *Report* already referred to, and of which we have made frequent use. We may moreover refer the reader to M. de Quatrefage's elaborate *Etudes sur les types inférieurs de l'embranchement des Annelides*, consisting of many *Memoires* published in the *Annales des Sciences Nat.*, 3me série, for the years 1848, 1850, and 1852. See also Siebold's *Anatomy of the Invertebrata* (translated by Dr Burnett), London, 1854; Dr Carpenter's *General Physiology*, 5th edit., *Ibid.*, 1854; and Mr Rymer Jones's *General Structure of the Animal Kingdom*, 2d ed , *Ibid.*, 1855.

Annelida.

The presence or absence of the organs of motion, and the position of the branchiæ, furnish natural characters of easy application, which modern zoologists have employed to signalize the primary groups. Lamarck divides the Annelida into three orders—*les Apodes, les Antennes*, and *les Sédentaires ;* and in the system of Cuvier they likewise form an equal number of orders—*les Tubicoles, les Dorsibranches*, and *les Abranches.* In both systems the Serpulæ occupy the highest position in the scale. Savigny's arrangement of these animals consists of five orders, of which the author has as yet treated only of four—viz., *les Néréidées, les Serpulées, les Lombricines*, and *les Hirudinées.* He places the Aphrodites and Nereids at the head of the class. Latreille is also of opinion that these Annelida, especially the Nereides, so far as regards their external organization, are entitled to precedence, and make the nearest approach to the articulated animals provided with feet, such as Insects and Crustacea.

We shall here, in as far as general arrangement is concerned, follow the system of Cuvier.[1]

ORDER I.—TUBICOLÆ, Cuv.

Some form a calcareous homogeneous tube, supposed to result from transudation, like the covering of testaceous Mollusca, but which does not adhere by any muscular attachment; others construct a covering by agglutinating grains of sand, broken shells, and other debris, by means of a membrane, likewise the result of transudation; while a third group are surrounded by a tube of an entirely membranous or corneous nature.

GENUS SERPULA, Linn. The body is composed of numerous segments; its anterior portion is enlarged in the form of a disk, armed on either side by several bundles of stiff bristles; and on each side of the mouth is a fan-shaped plume of branchiæ, usually adorned by lively colours. At the base of each plume is a fleshy filament, one or other of which is always prolonged and dilated at the extremity into a disk of various form, which serves as an operculum, and closes the overture of the tube whenever the contained creature chooses to retire. Of this genus the calcareous tubes cover, by their tortuous windings, the surface of stones, shells, and other submarine bodies. The species are widely distributed throughout the seas of Europe, India, and America. The largest are indigenous to the warmer climates of the globe. Little is known of their instinctive habits or natural economy. They are said to feed on aquatic animalcules, which they seize by means of their branchial tentacula.

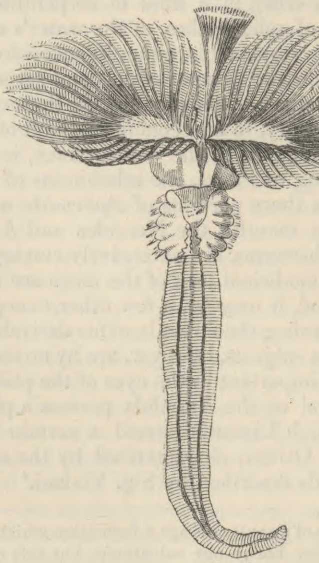

Fig. 1.

Linnæus, and most of the naturalists of his time, placed the Serpulæ among the testaceous Mollusca. They now constitute a numerous genus, of which several species occur in the European seas. They are very contractile, and are supposed to feed on animalcules. A well-known species, *S. contortuplicata* (fig. 1), has rounded tortuous tubes, of about three lines in diameter. Its operculum is tunnel-shaped, and its branchiæ are often of a beautiful red, or varied with yellow and violet. Any object thrown into the sea is apt to be speedily covered by this species.

Annelida.

In tropical seas they usually form their encrusting habitations in the midst of corals, lengthening their tubes as the coral is built up around them. Their extent is sometimes equal to three feet; and the expanded gill-tufts are of extremely vivid colours, equalling in brilliancy the brightest carnations. Some of the many small species which occur along our own coasts are also remarkable for the beautiful tinting of their gills.

GENUS SPIRORBIS, Lam. Branchiæ much less numerous than in the preceding genus (from three to four on each side), placed anteriorly in a somewhat radiated form. A pediculated operculum, with a flat summit placed between the branchiæ. Tube testaceous, and rolled after the manner of a *Cornu ammonis.*

This genus is composed of very small species, which are found attached to fuci, shells, and other marine bodies. They frequently occur in great numbers, though always separate from each other. The animals are of a blood-red colour. We have figured the *Sp. nautiloides* of Lam. (fig. 2) synonymous with the *Serpula spirorbis* of Linn.

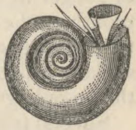

Fig. 2.

GENUS SABELLA, Cuv. *Amphitrite*, Lamarck. Body and fan-shaped branchiæ resembling those of the preceding genus, but both the fleshy filaments adhering to branchiæ terminate in a point, and do not form an operculum; they are sometimes even wanting. Their tube is rarely calcareous, and seems often formed of grains of very fine clay or mud. Most of the ascertained species are of considerable size, and are remarkable for the extreme delicacy and lustre of their plumy branchiæ.

One of the most splendid of the genus is figured by Dr Shaw under the title of *Tubularia magnifica.*[2] It is found on various parts of the coast of Jamaica, adhering to the rocks. It is extremely wary, and when approached instantly recedes within its tube, which on a further alarm also retires into the rock, so that specimens can be obtained only by breaking off portions of the mass. These, when put into tubs of sea-water, may be preserved for months, and the habits of the animals attentively studied. The species in question is characterized by a simple undulated tube of a whitish hue, the tentacula being varied by beautiful alternate bands of red and white. *Sab. vesiculosa* (fig. 3) is a British species described by Montagu.[3] The internal texture of its tube is coriaceous, but the outer coat is invariably covered by coarse sand, intermixed with fragments of shells. Considerable variety exists in the form and aspect of the genus Sabella.

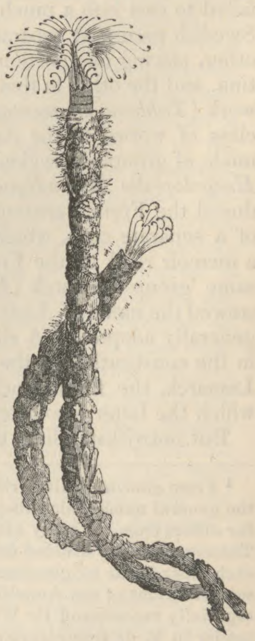

Fig. 3.

[2] *Linn. Trans.* v., p. 228, tab. 9.

[3] *Ibid.* xi., p. 19, tab. 5.

Genus Terebella, Cuv. These, like the preceding, inhabit a tube of their own formation, but composed of coarser materials than that of the generality of Sabellæ. Their body presents much fewer segments, and the head is otherwise adorned. Numerous filiform tentacula, capable of great extension, surround the mouth; and on the neck are placed the branchiæ, which are not fan-shaped, but in the form of little branches.

The animals of this genus, according to Montagu, either prepare a sheath from the tenacious secretion of their own bodies, mixed with adventitious matters, or reside in prepared perforations at the bottom of the sea. Their tubes are in general so extremely fragile as to be easily destroyed, and the animals are then found lurking beneath stones, or forming a new dwelling. Some fabricate their tube in old shells or stones, to which they adhere by their entire length, while others fix a tube perpendicularly in the sand. These tubes are indeed frequently observed to obtrude several inches above the surface of the soil, and when the waters flow, the gills and other appendages are stretched forth, and seem agitated to and fro. The gills or branchial appendages are extremely sensible, of a fine blood colour, and when touched they contract so suddenly as to expel the fluid which they contain, and then they lose their sanguine hue.

The cephalic tentacles form auxiliary organs of respiration, not for the aeration of the blood-proper, but for that of the peritoneal fluid already mentioned, by which they are filled. They exhibit some peculiar features. From their great length and vast number, they expose a large aggregate surface to the action of the surrounding medium. The lower surface of each tentacle is clothed with cilia, and is thinner than the dorsal aspect. The richly corpusculated peritoneal fluid enters freely into the hollow axis of all these tentacles, and is thus brought into contact with the surrounding waters. The tentacles themselves can grasp a grain of sand or other minute fragment, at any point of their length, or, if placed in a linear series, a row of grains. So perfect is the order of the muscular fibres at the extremity of each filament, that it is gifted with the twofold power of suction and ordinary muscular action. When the tentacle is about to seize upon an object, its extremity is drawn inwards (like a portion of the finger of a glove reversed) in consequence of the sudden reflex of the interior fluid. By this movement a cup-shaped cavity is formed, in which the object is securely held by atmospheric pressure—a power immediately reinforced by the contraction of the circular muscular fibres.

In addition to these important purposes, the tentacles of the Terebellæ are also the organs of locomotion. Being outstretched by the ejection into their interior of the peritoneal fluid—a process effected by an undulatory contraction of the body from behind forwards—they are next attached like so many slender cables to a comparatively distant surface, and being then shortened, the otherwise helpless body is hauled forwards. The concentration of the tentacles and branchiæ around the head in this genus, gives a great development in that quarter to the circulating system.

The generative apparatus conforms in its general arrangement with that of the earth-worm, and others, in presenting a segmental repetition of the ovigerous organs, while the male portion is grouped together in a lobated mass at the mesial line. We owe to M. Milne-Edwards a detailed account of the development of the young.[1] On first leaving the egg they exhibit no resemblance whatever to their parents, but might rather be mistaken for the ciliated larvæ of Polypi or Medusæ, presenting no vestige of the annular type of form. Ere long, however, their bodies become elongated, and begin to assume a somewhat symmetrical or two-sided form, consisting of four zones or rudimentary segments, the posterior of which is continuous, provided with a ciliary apparatus. A fifth ring next makes its appearance between the penultimate and terminal joint, while the rudiments of the mouth and alimentary canal become distinguishable. The growth now advances rapidly, the body becoming more worm-like as the segments are added between the last-formed segment and the terminal one. It is observable that the originally ultimate segment continues so to the end. Simple subulate setæ, supported by small fleshy tubercles, begin to appear on both sides, and the larva is no longer apodous. At this period it resembles a minute sub-cylindrical worm, and in a few days the cilia entirely disappear, the body now exhibiting the aspect of one of the erratic Annelids, in no respect resembling the tubicolous genus to which it actually belongs, and is ere long transformed into. This young larva is furnished with a distinct head, an antennary organ, eyes, and feet, provided with subulate setæ; while we afterwards come to know, that the adult or *perfect* state, as we are wont to term it, have neither head, eyes, nor antennæ, and exhibit feet furnished with hook-like appendages. Having lost its locomotive cilia, it now ceases to swim, and begins to inclose itself in a kind of mucous substance, which gradually solidifies into a cylindrical tube, open at both ends. The first stage of its existence, during which it has led an unfixed or erratic life, now closes, and it commences a life similar to that of its parents. The ventral oars, armed with terminal hooklets are successively developed, as are also the tentacular appendages around the head; but it is not till the creature has acquired some forty pair of feet, that the branchial apparatus begins to show itself under the form of two simple tubercles, springing from the lateral regions of the neck.

Dr Williams states that the number of setiferous feet constitutes by far the best character for the fixation of the boundaries of species. Between several of these, as constituted by Montagu, there is no actual difference but that of the age of the observed individuals. Many of the Terebellæ are gregarious, and some are so numerous that the sea-shore after a storm is seen to be covered with their fragments. When their tubes are entire, but a small portion of the body is protruded, with the exception of the long filiform tentacles, which are thrust about in all directions as if in search of food. The branchial appendages previously mentioned as so finely coloured during healthy life, are observed to lose their brightness from day to day as the animals become sickly in confinement.

Terebella gigantea, Mont., the largest of the genus, measures sixteen inches in length, and occurs, though rarely, on the coast of Devonshire.

Genus Amphitrite, Cuv. *Pectinaria*, Lam. Recognizable by the golden-coloured bristles ranged in a coronal or pectinated manner, in one or more rows, on the anterior portion of the head, where they probably serve either as a means of defence, for the purposes of locomotion,[2] or for collecting the materials of their dwelling. Numerous tentacula surround the mouth, and at the commencement of the back, on either side, there are comb-shaped branchiæ.

The gills or branchial appendages of this genus are attached to the anterior part only of the body; and this is the case, in fact, with all the tribes that inhabit tubes, because gills attached to the other parts which are covered, would be useless for the purposes of respiration.[3]

---

[1] *Recherches Anatomiques et Zoologiques faites pendant un Voyage sur les Côtes de la Sicile. Annales des Sciences Nat.*, 3e série, Zool. t. iii. (Mars 1845).

[2] Montagu observed *Terebella venustula* fixing its tentacula, and then, by contracting them, draw its body forward.

[3] Griffith's *Animal Kingdom*, vol. xiii., p. 86.

Certain species construct very light and delicate tubes, in the form of a lengthened cone, which they carry along in the course of their travels. Their golden bristles form two combs, the teeth of which are directed downwards. Their intestine is very ample, folded several times, and is usually filled with sand. A well-known European species is the *Amph. auricoma Belgica* of Gmelin, of which we have given two representations (fig. 4). Its tube measures about two inches in length, and is formed of little rounded grains of various colours. Other species attach their tubes to different substances; and their golden setæ form upon the head several concentric crowns, from which an operculum is produced, which closes the tube when the animal is in a state of contraction. Each foot is furnished with a cirrhus, and the body, terminating posteriorly in a tube curved towards the head, is provided with a kind of muscular gizzard.[1] To these belong *Amph. alveolata*, Ellis, *Corall.* 37, of which the tubes, combined in a compact mass, present regularly disposed orifices, resembling the cells of a piece of honeycomb. Another species, *Amph. ostrearia* of Cuvier, forms its tubes on the shells of oysters, and is said to be extremely injurious to the increase of that valuable mollusc.

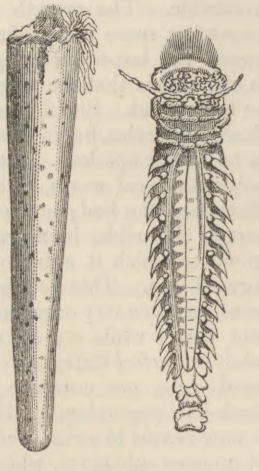

Fig. 4.

Cuvier has placed in this order of Annelida the singular genus Syphostoma (fig. 6), first made known by Dr Otto in a dissertation published at Breslau in 1820. It appears to have two anterior openings or mouths.[2]

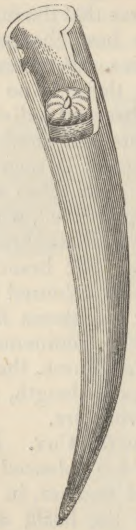

Fig. 5.

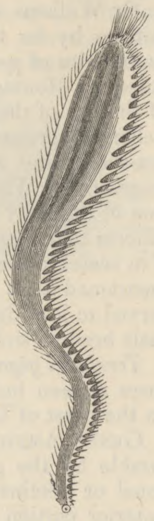

Fig. 6.

Here also, but with a very doubtful claim, the genus Dentalium (fig. 5) is allowed to stand. Its covering is a solid calcareous shell, in the form of an arched elongated cone, open at both ends, and compared by some to a small tusk of an elephant. The animal itself does not appear to be in any way articulated, nor to possess lateral setæ. Its body is of a conical form, like that of the shell, and is very smooth and compact.[3]

It seems now to be determined that the position of this last-named genus in the Cuvierian system was a misplacement. Dr Williams is very clearly of opinion that the researches of Deshayes and Savigny, and more satisfactorily of M. de Blainville and Mr Clark (in *Annals of Nat. Hist.* for Nov. 1849), have proved that the *Dentaliadæ* are gasteropodous Mollusca, ranking somewhere between *Chiton* and *Patella.* In *Dentalium*, the symmetrical sub-ventral position of the branchiæ, the posterior flow of water which takes place in them, and the resemblance of the foot to that of some of the bivalves, appear in a striking manner to prove its connection with the *Conchiferæ*, whilst by its œsophageal cerebral ganglions, and the completeness of its circulating system, its affinity to the Gasteropod is established. But neither can it be disputed that the genus exhibits some peculiar approximations to the Annelida or annulose tribes; such as the red blood, the vermiform configuration of the posterior portion of the body, the tubular figure of the shell, the operation of the operculum, and the apparent resemblance of the branchiæ to those of the *Sabellæ.* All these characters may readily be viewed as prefiguring some of the outward features of the Annelida, although they are in truth only analogies of an apparent and superficial nature. The species have therefore been excluded from the latter class in Dr Williams' *Report.* Our author maintains the close and natural approximation of the Annelida and Entozoa.

Order II.—DORSIBRANCHIA.

The genera of this order bear their branchiæ throughout the length of their body, or are at least along its middle portion, and in the various forms of branches, tufts, plates, or tubercules, in which the sanguineous vessels ramify. The majority of the species live in the mud, or swim freely in the sea. A few dwell in tubes.[4]

Those in which the branchiæ are most highly developed are placed at the head of the order.

Genus Arenicola, Lam. Branchiæ numerous, complicated, bush-shaped, and disposed over the intermediate segments of the body. Mouth terminal, in the form of a dilatable fleshy trunk, without either teeth or tentacula. No apparent eyes. The posterior extremity wants both the branchiæ and the bundles of setæ with which the other segments are furnished. There are no cirrhi to any part of the body.

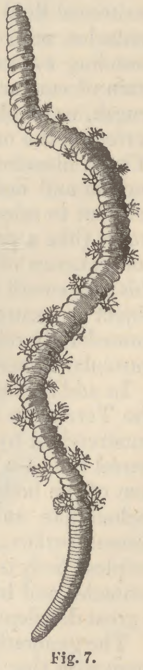

Fig. 7.

This genus was established by Lamarck, at the expense of the old genus *Lumbricus* of Linnæus. The best-known species, *A. piscatorum* (*Lum. marinus*, Linn.) or lug-worm (fig. 7), measures about a foot in length, and bears thirteen pair of branchiæ. It is of a reddish colour, and, when handled, stains the fingers of a fine yellow. It inhabits moist sand by the sea-shore, and is much used as a bait by fishermen.

This Annelid lives almost entirely by the swallowing of sand, and its position is indicated by the numerous little coils so frequent on the sea-shore below high-water mark. The sand traverses the entire extent of the animal's body, yielding for digestion and assimilation whatever it may contain of an organic nature, the residuum being rejected in the form of sand-coils. Deglutition, with this species, can only be performed when the sand is saturated with water. If too dry, it cannot be swallowed; if too wet, it cannot be seized by the proboscis.

Though the lug-worm may seem to inhabit the loose moist sand, or to perforate it merely mechanically, it is well known to secure the sides of the passage from closing in by applying to them a glutinous cement, which unites the particles of sand into a kind of wall or coating. This covering does not adhere to the body, but forms a surrounding tube, within which the animal moves with perfect freedom, and which it leaves behind it as it progressively advances; so that the passage is kept pervious throughout its entire length by means of the lining, which may not inaptly be compared to the brickwork of the shaft of a mine or tunnel.[1]

---

[1] These species form the genus *Sabellaria* of Lamarck, and Hermella of Savigny. No department of natural history is more darkened by a confused cloud of synonyms than that which treats of the Annelida. "Ces perpétuels changements des noms," says Cuvier, "finiront par rendre l'étude de la nomenclature beaucoup plus difficile que celle des faits." (*Règne Animal*, t. iii., p. 195.)

[2] See the article *Siphostome*, in the *Dict. des Sciences Nat.*

[3] See Savigny, *Système des Annelides*, p. 98; and Deshayes, *Monographie du Genre Dentale*, in *Mém. de la Soc. d'Hist. Nat. de Paris*, t. ii., p. 321. We may here note, that the genus *Dentalium* (now classed with the molluscous tribes) seems to have been equally abundant in ancient as in modern times,—many of its calcareous tubes being found in a fossil state.

[4] Consult Orsted's *Gronlands Annulata dorsibranchia*, Kjöbenhaven, 1843; and by the same author, *Beschreibung der Plattwurmer*, ibid., 1844.

As allied to *Arenicola*, we may here name a singular Annelid, or sea-worm, called *Palolo*, of which specimens were some years ago presented to the British Museum by the Rev. J. B. Stair.[2] It is described by Mr J. E. Gray as characterized by—"a cylindrical body, separated into equal joints, each joint with a small tuft of three or four spicula on the middle of each side. Head——? Last joint ending in a couple of tentacles. Eggs globular." Most of the specimens examined were unfortunately much broken; and as none of the portions possessed a head, Mr Gray very properly did not describe it. He names the species *Palolo viridis*. It is of a green colour, with a row of round black spots down the middle of the dorsal (?) surface,—one spot on the middle of each joint. The following is Mr Stair's account of its habits and locality:—

"Palolo is the native name for a species of sea-worm which is found in some parts of Samoa (the Navigator Islands), in the South Pacific Ocean. They come regularly in the months of October and November, during portions of two days in each month, viz., the day before, and the day on which, the moon is in her last quarter. They appear in much greater numbers on the second than on the first day of their rising, and are only observed for two or three hours in the early part of each morning of their appearance. At the first dawn of day they may be felt by the hand swimming on the surface of the water; and as the day advances their numbers increase, so that by the time the sun has risen thousands may be observed in a very small space, sporting merrily during their short visit to the surface of the ocean. On the second day they appear at the same time, and in a similar manner, but in such countless myriads that the surface of the ocean is covered with them to a considerable extent. On each day, after sporting for an hour or two, they disappear until the next season, and not one is ever observed during the intervening time. Sometimes, when plentiful at one island in one month, scarcely any are observed the next; but they always appear with great regularity at the times mentioned, and these are the only times at which they are observed throughout the whole year. They are found only in certain parts of the islands, generally near the openings of the reefs on portions of the coast on which much fresh water is found; but that is not always the case.

"In size they may be compared to a very fine straw, and are of various colours and lengths, green, brown, white, and speckled, and in appearance and mode of swimming resemble very small snakes. They are exceedingly brittle, and if broken into many pieces, each piece swims off as though it were an entire worm. No particular direction appeared to be taken by them in swimming. I observed carefully to see whether they came from sea-ward or rose from the reef, and feel assured they came from the latter place. The natives are exceedingly fond of them, and calculate with great exactness the time of their appearance, which is looked forward to with great interest. The worms are caught in small baskets, beautifully made; and when taken on shore are tied up in leaves in small bundles and baked. Great quantities are eaten undressed, but either dressed or undressed are esteemed a great delicacy. Such is the desire to eat palolo by all classes, that immediately the fishing parties reach the shore, messengers are despatched in all directions with large quantities to parts of the island on which none appear."[3]

GENUS AMPHINOME, Brug. A pair of branchiæ on each segment of the body, and two bundles of setæ, and a pair of cirrhi to each foot. The sucker is destitute of maxillæ.

This genus was formed by Bruguière from *Aphrodita* of Pallas, and *Terebella* of Gmelin. Savigny divides it into three, viz.,—

1*st*, Gen. CHLŒIA, containing such as have five tentacula to the head, and branchiæ in the form of tri-pinnate leaves.

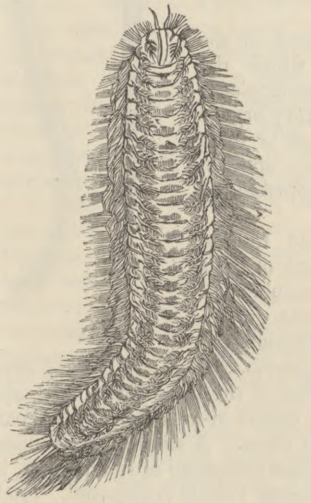

Fig. 8.

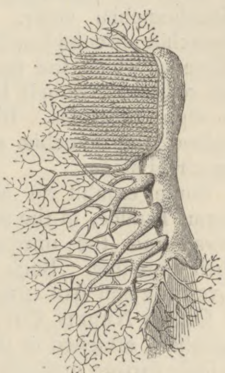

Fig. 9.

We have figured as an example a large and beautiful species, *C. capillata* (fig. 8), remarkable for its long and thick-set bundles of setæ of a brilliant yellow, and its purple branchiæ. It inhabits the Indian Seas. 2*d*, Gen. PLEIONE, containing those species which, with the same number of tentacula, have tufted branchiæ. 3*d*, Gen. EUPHROSINE, containing species characterized by bushy branchiæ (fig. 9), of a complicated structure, and strongly developed. The head is furnished with only a single tentaculum. The known species inhabit the Red Sea.

GENUS EUNICE, Cuv.—*Leodice*, Sav. Branchiæ in the form of plumes, but the mouth or trunk armed with three pair of corneous maxillæ of different forms. Each foot has two cirrhi and a tuft of setæ. The head bears five tentacula placed above the mouth, and two on the nape of the neck. Some of the species are furnished with a pair of eyes.

This genus contains a monstrous worm, *Eun. gigantea*, Cuv., the largest of all known Annelida. It measures from four to six feet in length, and its body consists of 448 segments. Its colour is ashy grey, with an opalescent reflection. It inhabits the Indian Seas. Montagu (in *Linn. Trans.*, vol. xi., pl. 3) has figured and described a species, under the title of

---

[2] *Proceedings of the Zoological Society*, March 9, 1847.

[3] We owe a recent notice of this marine worm (misnamed a *fish*) to the Rev. William Harbutt, now officiating under the London Missionary Society. The following is an extract of a letter (addressed to Mr R. M. Smith of Edinburgh,) dated Samoa, 9th December 1854:—"I remember I promised to send you a few of the singular fish which annually visits our shores, and only on one morning in the year—the day in which the moon enters her last quarter in November. I should say two days, for on the first day the fish are just seen, few in number, and for a few minutes; on the second in great numbers. This year I had an argument with the people here. They calculated that the fish would appear on the 11th and be taken on the 12th; I, by the almanac, told them the days would be the 12th and 13th, and I proved correct. I was at the fishing, and a busy hour it was." The specimens transmitted to Mr Smith did not arrive in very good condition. *Palolo* seems to be, if not brittle, at least what mineralogists term "easily frangible."

Nereis sanguinea, but which, from the author's description of the jaws, is no doubt referrible to the present genus, or rather to that subdivision of it called Marphysa by Savigny, and distinguished by the absence of nuchal tentacula. The body is long, slightly depressed beneath, and its segments exceed 270, about 40 of which, at the posterior extremity, were of a much paler colour than the others, and appeared to Montagu as if they had been lately reproduced. The rest of the body was of a fine bronze colour, resplendent with changeable prismatic tints. It is a large species, measuring fourteen or fifteen inches in length. *Eun. tubicola* (fig. 10) inhabits the North Sea, and is remarkable for dwelling constantly in a solid corneous transparent tube.

After the preceding genera of the dorsibranchial order, of which the branchiæ are complicated, Cuvier places those of which the respiratory organs are reduced to simple laminæ, or even to slight tubercles. In some species, indeed, the branchiæ are represented by cirrhi alone.

Some exhibit an alliance to the genus Eunice, in the strength of their jaws, and the unequal number of their antennæ. Such are the genera Lysidice and Aglaura of Savigny.

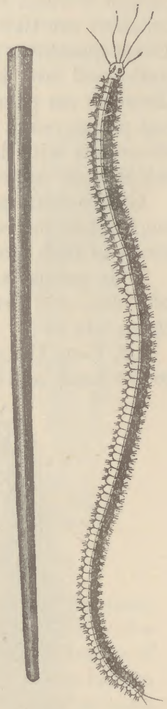

Fig. 10.

Genus Nereis, Cuv.—*Lycoris*, Sav. Tentacula of even numbers, attached to the sides of the base of the head, and a little further onwards two others bi-articulate, with a pair of simple tentacula between them. A single pair of maxillæ in the proboscis. Branchiæ composed of small plates, in which a net-work of sanguineous vessels is disposed. Each foot is moreover provided with two tubercles, two bundles of setæ, and an upper and under cirrhus.

"The Nereides," it is observed in Mr Griffith's Supplement, "most usually live in the excavations of littoral rocks, in the hollows of sponges, in certain alcyones, in univalve or bivalve shells, in madrepores, in the interstices of the radicles of Thalassiophytes, under stones, and in general in all bodies which present fissures more or less profound. There are some which bury themselves in mud or sand, where they excavate a lodge proportional to the dimensions of their body, and sometimes they line this dwelling with a mucous matter issuing from their body, in sufficient abundance to construct a tube or sheath. From this they put forth a greater or less portion of their body, but rarely the posterior extremity, so that they may be able to re-enter on the slightest indication of danger. They all appear to feed upon animal substances, whether in the living state, or in a state of putrefaction more or less advanced. M. Bosc, who has observed the manners of some species on the coasts of the United States, tells us positively that these animals feed upon polypi and small worms, on which they throw themselves, by darting out the anterior part of their body, which they have first contracted. Otho Fabricius tells us of some species of Spio, or Nereides with tubes, that they seize the planariæ on which they feed, by means of their long tentacula."

The species of this genus have a linear-shaped body, more or less convex above, and composed of numerous segments. The term Sea Scolopendræ, sometimes applied to them, expresses not inaptly their usual form. The species represented (fig. 11) is *Nereis nuntia*. *N. margaritacea* of Leach is distinguished by its pearly body, terminated by two long setæ. Its head is tri-lobate, with eight tentacula. This species is common near the Bell Rock, and is subject to great variation of colour.

Near the preceding Nereids may be classed several genera of the same slender form, and with branchiæ reduced to simple plates, or even to threads or tubercles. In some the maxillæ and tentacula are absent.[1]

Genus Phyllodoce, Sav.[2] Tentacula on the side of the head, in equal numbers, with four or five smaller ones in advance. Eyes apparent. Trunk large, and provided with a circle of very short fleshy tubercles. No apparent jaws. Branchiæ broad, and in the form of leaves, thin, flat, and veined. Body linear, with many segments.

Ph. laminosa, Sav., is almost cylindrical, and consists of from 325 to 338 segments. It is of a brown colour, with reflections of purple and violet. Though nearly a foot long, it measures only a line and a half in breadth. It inhabits the shores of Nice. The *Nereis lamelligera atlantica* of Pallas[3] is probably a Phyllodoce.

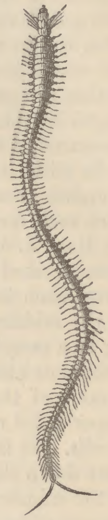

Fig. 11.

Genus Alciopa, Aud. and Edw. Mouth and tentacula resembling those of the preceding genus, but the feet or organs of movement present, in addition to the tubercles which bear the setæ and foliaceous cirrhi (branchiæ), two branchial tubercles, which occupy the upper and under margins.

Genus Spio, Fab. Body slender, with two very long tentacula resembling antennæ. Head furnished with eyes. Branchiæ on each segment of the body, in the form of a simple filament.

The species of this genus occur chiefly in the North Sea. They are of small size, and dwell in membranous tubes. They continually agitate their long tentacula. We have figured as an example the *S. crenaticornis* of Montagu (fig. 12).[4]

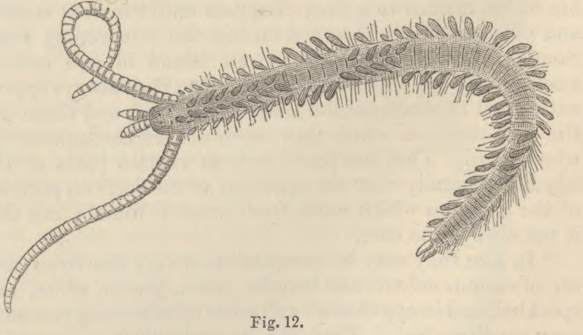

Fig. 12.

The tube of this species is extremely tender, being composed of minute adventitious matter slightly agglutinated. It is usually attached to *Sertulariæ*. In general the feelers or tentacula are alone displayed; these are kept in constant motion, and are turned about in all directions, although they are at the same time capable of instantaneous contraction.

Genus Syllis, Sav. Tentacula of uneven number, and moniliform, in common with the superior cirrhi of the feet. The latter very simple, with a single tuft of setæ.

Some diversity seems to exist in this genus in regard to

---

[1] Consult Rathké *De Bopyro et Nereïde*, Rigæ, 1837.

[2] Not to be confounded with the genus so named by Ranzani (in *Mem. di Storia Natur.* dec. prima, pl. i., fig. 2-9), at a period posterior to the publication of Savigny's work.

[3] *Nov. Act. Petrop*, t. ii., 233, tab. 5.

[4] *Linn. Trans.* xi., tab. 14, fig. 6 (not 3, as in the author's *references* to his own figures).

the presence or absence of the so-called jaws. The segments of the body are very numerous.

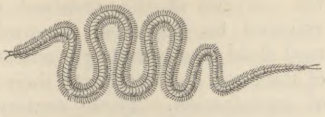

Fig. 13.

S. Monilaris, Sav. (fig. 13) inhabits the Red Sea. Its body is long (consisting of 341 segments), slightly depressed, insensibly narrowed towards the tail, which terminates in two slender moniliform threads.

Genus Glycera, Sav. Recognizable by the form of the head, which bears the shape of a fleshy conical point, resembling a little horn, and of which the summit is divided into four scarcely perceptible tentacula. The maxillæ are alleged to vary as in the preceding genus.

Few of the species have been observed in a recent state. *G. unicornis* is supposed by some to be identical with the *Nereis alba* of Muller and Gmelin. Its native country is unknown. *G. Meckelii* of Audouin and Edwards occurs on the shores of France.[1]

Genus Nephthys, Cuv. The species of this genus are distinguished by a trunk resembling that of Phyllodoce, but they want the tentacula, and have on each foot two bundles of setæ, widely separated, with an intermediate cirrhus.

The only species admitted by Savigny is *N. Hombergii*, discovered by the gentleman whose name it bears, near Havre de Grace.

Genus Lombrinera, Blainv. Tentacula wanting. The body, which is extremely elongated, bears on each segment merely a little forked tubercle, from which issues a small bundle of setæ.

To this genus are referrible, among other species, the *Nereis ebranchiata* of Pallas,[2] and the *Lumbricus fragilis* of Muller.[3] The latter forms the doubtful genus *Scoletoma* of Blainville.

Genus Aricia, Sav. Teeth and tentacula wanting. Body elongated, with two rows of lamellar cirrhi on the back. Anterior feet furnished with dentated crests, which are absent from the other organs of movement.

Genus Hesione, Sav. Body short, thickish, composed of few segments, and these not very distinguishable. A very long cirrhus, probably performing the functions of branchiæ, occupies the upper part of each foot, which has also another beneath, and a tuft of setæ. The sucker is large, but unprovided with either teeth or tentacula.

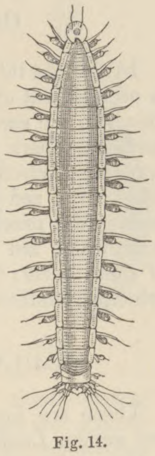

Fig. 14.

The species, though few in number, seem pretty widely distributed. *H. splendida*, Sav.[4] (fig. 14) occurs on the coasts of the Red Sea, and was found by Mathieu at the Isle of France. *H. festiva* greatly resembles the preceding, though of smaller size. It was discovered in the neighbourhood of Nice, by M. Risso.[5]

Genus Ophelia, Sav. Body thick and short, with the segments not very apparent, and the setæ scarcely visible. For two-thirds of its extent long cirrhi serve as branchiæ. The palate contains a toothed crest, and the lips are surrounded by tentacula, of which the two upper are larger than the others.

O. bicornis, Sav., discovered by Orbigny, seems the only species yet distinctly known.

Genus Cirrhatulus, Lam. A very long branchial filament, and two small tufts of setæ on each segment of the body. These segments are very numerous and closely set, and there is an additional range of filaments on the posterior part of what may be called the neck. The head, but slightly apparent, has neither jaws nor tentacula.

To this genus Lamarck (under the name of C. *borealis*) refers the *Lumbricus cirrhatus* of Otho Fabricius.[6] Cuvier considers the *Terebella tentaculata* of Montagu[7] as likewise being a species of Cirrhatulus.

The body of this marine Vermis is long and slender, and composed of more than 200 annulations, each of which is furnished with two fasciculi of very minute bristles. There are no eyes, and the branchiæ are obscure. From the sides of the segments issue very long, red, capillary, appendages, most numerous near the anterior end, the extreme point of which, however, is destitute of them, and becomes acuminated. The mouth is placed on the inferior face. The posterior end is likewise obtusely pointed. The length of this animal is eight or nine inches. The colour of the upper portion is olive green; of the under, dull orange. While in a state of nature, the filiform appendages of the sides are in continual motion, appearing like slender red worms, twisting themselves around the body in all directions. This curious species was taken from a piece of timber that had been perforated by *Pholades*, and was destitute of any natural covering.[8] Although Montagu placed it in the genus *Terebella*, he expressed his doubts as to the genus to which it really belonged.

Cirrhatulus Lamarckii, so abundant between tide-marks on the coast of Swansea, is described by Dr Williams as subsisting almost entirely by swallowing clay. Its long branchial appendages are but slightly, if at all subservient to the seizing of food. The mouth is a small circular orifice, situated ventrally a short distance below the tapering snout in which it terminates, and is well adapted for the suction of semi-fluid food. The native colours of this marine worm are beautifully variegated; the brilliant yellow of the intestine, which begins near the head and continues to the tail, being relieved by the greenish hue of the back, and contrasting well with the vermilion thread which spangles every portion of the body. This creature is capable of throwing out from the general cutaneous surface a considerable quantity of viscid secretion, by which it is enabled to roll itself within an impenetrable coat of mail. The mechanical art of applying the surrounding substances to the body is accomplished by the thready appendages; and nothing can be more exquisite and admirable than the perfect, though very rapid manner in which these microscopic strings accomplish their protecting work. In its natural state, *Cirrhatulus* does not seem so much to inhabit channels, as soft semi-fluid clay, in which it is found beneath stones, near the ebb-mark of the tide.

Genus Palmyra, Sav. Setæ of the upper tufts large, flattened, fan-shaped, and shining with the brilliancy of polished gold; under tufts small. Cirrhi and branchiæ not much developed. Body elongated, with two rather long, and three very short tentacula.

The only known species is *P. aurifera*, a native of the Isle of France, from whence it was sent to Paris by M. Mathieu.

Genus Aphrodita, Linn. Distinguished by its two longitudinal ranges of broad membranous scales, which cover the back, and beneath which the branchiæ, in the form of little fleshy crests, are concealed.[9]

The form of these Annelides is usually flattish, and is shorter and broader than in most of the genera. The interior contains a very thick and muscular œsophagus, susceptible of being in part protruded outwards, like a trunk or sucker; there is likewise an unequal intestine, furnished on each side with a great number of branched cæca, of which the extremities are attached between the bases of the tufts of setæ, which serve as locomotive organs. It is alleged that the sexes are separate in the Aphroditæ, and that the females are oviparous. At certain periods the female is certainly found filled with egg-like substances, which swim in a circumambient liquid, and the male is said to abound with milt.

[7] *Linn. Trans.* ix., pl. vi., fig. 2.

[8] *Ibid.*, p. 110.

[9] In the opinion of some observers, the *Aphroditæ* offer an exception to the characters of their class, in not being possessed of *red blood*, but Cuvier has stated his belief (*Règne Animal*, t. iii., p. 186, *note*) that that feature is distinguishable in *Aph. squamata*.

The ordinal term of dorsibranchiate scarcely applies to the majority of the species, so many of which present no branchial appendages either on the back or elsewhere. They are exceptional also in this respect, that their blood is colourless. Respiration is performed on a different principle from that which pervades the other annelids. The blood-system is in abeyance, while that of the chyle-aqueous is exaggerated, and this fluid of the peritoneal cavity is in this group the exclusive medium through which oxygen is absorbed.

Savigny has raised this genus to the rank of a family, containing three genera, viz., *Palmyra*, already noticed, *Halithea*, and *Polynoe*.

To the genus *Halithea* belongs a well-known British species, *Aph. aculeata*, Linn. It is of an oval form, six or seven inches in length, and nearly two inches broad. The scales of the back are covered, and in part concealed, by a substance resembling tow, which takes its growth from the sides. From these sides also spring groups of strong spines, which partially pierce through the tow-like substance, and bundles of softer and more flexuous bristles, which shine with the brilliancy of gold, or exhibit the various tints of the rainbow, scarcely yielding in beauty, as Cuvier has observed, either to the lustrous plumage of the humming-bird, or the sparkling of precious gems. Lower down is a tubercle, from which spines issue in three groups, and of three different sizes, and lastly, a fleshy cone. There are forty of these tubercles on each side; and between the first two there are a pair of small fleshy tentacula. There are fifteen pair of broad scales, sometimes pursed, upon the back, and fifteen small branchial crests on each side. This curious creature is known along our native shores by the name of *sea-mouse*. Two other species, *Aph. sericea* and *hystrix*, are referrible to the same genus.

It appears from Dr Williams' observations that the true aphrodite type of respiration occurs in *Aphrodita aculeata*. In this species, the actual uses of the "elytra," or dorsal scales, become apparent. Furnished with a peculiar apparatus of muscles, they exhibit periodical movements of elevation and depression. Overspread by a coating of felt, easily permeable by the water, the space beneath the scales, during their elevation, becomes filled with a large volume of *filtered* water, which, during the descent of the scales, is forcibly emitted at the posterior end of the body. It is important to remark that the current thus established laves only the *exterior* of the dorsal region of the body. It nowhere enters the internal cavities, the latter being shut up by a membranous partition from that spacious exterior enclosure bounded above by the felt and the elytra. The peritoneal chamber is very spacious in this species, and is filled by a fluid which only in a slight degree contains organized particles. The complex and labyrinthic appendages of the stomach lie *floating* in this fluid, and in the chambers which divide the roots of the feet. From this relation of contact between the peritoneal fluid and the digestive cæca, *which are always filled by a dark green chyle*, Dr Williams regards it as impossible to resist the conclusion that the contained fluid is really a *reservoir* wherein the oxygen of the *external* respiratory current already referred to, becomes accumulated. From the peritoneal fluid the aërating element extends in the direction of the cæca, and imparts to their contents a higher character of organization. These contents thus prepared by a sojourn in the cæca of the stomach, become the direct pabulum for replenishing the *true* blood which is distributed in vessels over the parietes of those chylous repositories.

Another subdivision of the Linnæan Aphroditæ has none of the flax-like substance on the back—the tentacula are five in number—and the trunk encloses strong corneous mandibles (fig. 15). It is named *Polynoe* by Savigny, and contains most of the old species described by Linnæus, Pallas, Muller, and Otho Fabricius. The *Aph. clava* of Montagu[1] is a Polynoe. Several other generic groups have been recently formed by Audouin, Milne-Edwards, and others, from the genus Aphrodita.[2]

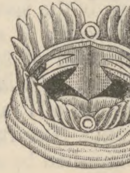

Fig. 15.

In Erichson's *Archives* (for January 1845), we have an interesting note on the development and metamorphoses of *Polynoe cirrata*. It is born under a larva form greatly resembling the young of a very dissimilar genus *Terebella*. The eggs are found in packets on the back of the mother, and are of a bluish colour. The larva, of an ovoid form, and greenish colour, bears in front of its ciliated cincture a cephalic lobe, terminated by a little bundle of ciliæ, and enclosing two blackish eye-shaped points. The mouth is transverse, and is placed behind the ciliated collar.

GENUS CHÆTOPTERUS, Cuv. Mouth with neither trunk nor sucker, provided above with a lip, to which are attached two or three small tentacula. Then follows a disk, furnished with nine pair of feet, followed by a couple of long silky bundles like wings. The lamelliform branchiæ are attached rather to the under than the upper portion, and prevail along the middle of the body.

There is only one species of this singular genus, *Ch. pergamentaceus*, Cuv. which measures from eight to ten inches in length, and inhabits a tube formed of a substance resembling parchment. It occurs in the West Indian seas.[3]

ORDER III.—ABRANCHIA.

In this the third principal division of the Annelida there is no apparent external organ of respiration. Certain species, like the earth-worm, seem to respire over the entire surface; others, like the leech, by interior cavities. We perceive a circulating system of closed vessels, generally filled with red blood, and a nervous knotted cord, as among the preceding groups.[4] Some are furnished with setæ, which aid the locomotion, while others are destitute of these parts; from whence arises a subdivision into two principal families.

FAMILY I.—ABRANCHIA SETIGERA.

These are furnished with setæ, and correspond to the two genera *Lumbricus* and *Nais* of Linn.

GENUS LUMBRICUS, Cuv. Body long, contractile, cylindrical, divided by wrinkles into a great number of apparent rings. Mouth without teeth, subterminal, bilabiate, the upper lip larger than the other, advanced. No eyes.

---

[1] *Linn. Trans.* ix., pl. vii., fig. 3.

[2] See *Règne Animal*, t. iii., p. 207.

[3] For descriptive notices (with figures) of several rare and otherwise interesting *British* Annelida, consult a series of papers published in the *Magazine of Natural History* (chiefly volumes 6th and 7th), by an excellent observer, the late Dr Johnston of Berwick.

[4] See M. Ant. Dugés *Sur l'Anat. et Phys des Annel. Abranch.* in *Ann. des Sciences Nat.* for September 1828.

This genus corresponds to *Enterion* of Savigny, and contains the earth-worms and other species. The setæ are rough and short, as if unguiculated. Each segment is provided with eight of these setæ, that is, four on each side, united in pairs, and forming, by their distribution on the body, eight longitudinal rows, of which four are lateral and four inferior. From six to nine of the segments, comprised between the 26th and the 37th, are swollen, and form towards the anterior and superior portion of the body a kind of cincture, especially perceptible during the breeding season. In the interior of these creatures we perceive a straight wrinkled intestine, unprovided with a cæcum, but receiving in its course several muscular fibres (proper to the rings of the body), which form an equal amount of small diaphragms. Some internal whitish glands towards the anterior of the body are regarded as connected with the generative system. The nervous cord consists of a series or infinity of very small ganglia, closely set together. The circulation of the blood among the Lumbrici is by no means difficult to detect. We may perceive arising from the intestinal canal, and from the inner surface of the outer envelope, an infinite number of small veinous vessels, which interlace with a great assemblage of arterial ones. These veins unite in one common trunk, placed longitudinally beneath the belly, and from that trunk proceed five small canals, which unite in a single dorsal vessel, which may be regarded as the heart. From the last-mentioned organ small arteries take their origin, and proceed to form a network with the veins of the superficies of the body,—thus completing the circulation. Respiration appears to be carried on at the surface of the skin, most likely by means of extremely small internal branchiæ.

The appearance of the common earth-worm (*Lumoricus terrestris*) is too familiar to need description in this place. We shall merely mention, that beneath the sixteenth segment there are two pores, the uses of which are still unknown. The mode of production is likewise still disputed. M. Montegre[1] maintains that the eggs descend between the intestine and the outer envelope, around the rectum, where they hatch, and are speedily protruded in the living state. M. Dufour, on the contrary,[2] asserts that they lay eggs resembling those of leeches[3] (fig. 16). The ordinary habits of the earth-worm are well known. They inhabit moist earth, which they pierce in all directions, and a quantity of which they swallow. They also, however, feed on animal and vegetable remains, and always prefer soil imbued with those substances. They seek each other's society chiefly during the night, and in the month of June. Under the specific name of *terrestris*, naturalists have no doubt confounded many different kinds. Savigny, to whom we owe so much in relation to the Annelida in general, has, since the publication of his great work on that class, devoted his attention more particularly to the genus Lumbricus, and has ascertained the existence of about twenty-two species in the environs of Paris alone.[4]

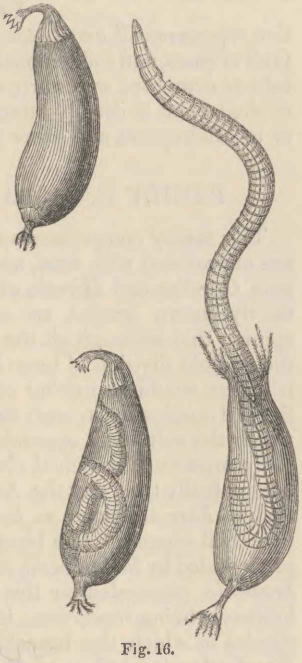

Fig. 16.

Earth-worms undoubtedly possess a certain reproductive power, when deprived of portions of their bodies, but not to the extent of producing perfect individuals from separated portions. It is easy to conceive that the removal of the hinder part of the body, which does not contain any organs essential to life, would not destroy the anterior portion; but that the hinder half, when left to itself, should reproduce the mouth, gizzard, stomach, and other important parts, was much less likely. On cutting an earth-worm into two, the anterior portion, according to Mr Rymer Jones, is generally found to survive; but this is not the case with the other end, which, although it may show signs of vitality for a length of time, possesses no power of reproduction, and eventually dies. The experiments, however, of M. Dugés, certainly go to prove that very important portions may be removed and reproduced. He cut off from four to eight of the anterior rings, thereby, of course, removing the cephalic pair of ganglia, the mouth, and a part of the œsophagus. After the lapse of from ten to thirty days, a conical vascular protuberance was perceived to sprout from the bottom of the wound; and in eight or ten days more, this new portion had become so far developed, that not only were all the removed rings apparent, but even the mouth and upper lip had assumed their pristine form, and the creature began to swallow food, and bury itself beneath the earth. Dr Williams' experiments, again, were attended by an entirely different result. He found that although the anterior half, after the bisection, did not lose the power of locomotion, its movements after a few days became much less active and vigorous. The wounded segment soon began to contract and wither away; and this process of dissolution, creeping onwards from segment to segment, the cephalic extremity, or head itself, soon ceased to live. The tail half loses at once all power of onward motion, and merely writhes about on one spot. Its movements become *excited*, not *voluntary*, and it never re-acquires the power of swallowing earth. The process of decay begins much sooner than in the other half, and, extending towards the tail, implicates first one ring, and then another, till the whole is dead.[5]

The common earth-worm, though apt to be despised and trodden on, is really a useful creature in its way. Mr Knapp describes it as the natural manurer of the soil, consuming on the surface the softer parts of decayed vegetable matters, and conveying downwards the more woody fibres, which there moulder and fertilize. They perforate the earth in all directions, thus rendering it permeable by air and water, both indispensable to vegetable life. According to Mr Darwin's mode of expression, they give a kind of under-tillage to the land, performing the same below ground that the spade does above for the garden, and the plough for arable soil. It is, in consequence, chiefly of the natural operations of worms that fields which have been overspread with lime, burnt marl, or cinders, become in process of time covered by a finely divided soil, fitted for the support of vegetation. This result, though usually attributed by farmers to the "working down" of these materials, is really due to the action of earthworms, as may be seen in the innumerable *casts* of which the initial soil consists. These are obviously produced by the digestive proceedings of the worms, which take into their intestinal canal a large quantity of the soil in which they feed and burrow, and then reject it in the form of the so-called casts. "In this manner," says Mr Darwin, "a field, manured with marl, has been covered, in the course of 80 years, with a bed of earth averaging 13 inches in thickness."

[2] *Ann. des Sciences Nat.*, t. v., p. 17; and xiv., p. 216.

[3] This seeming contrariety may be reconciled by bearing in mind that these creatures are in fact *ovo-viviparous*, and are sometimes born in the completed state, sometimes still surrounded by an envelope or egg-like covering. Dr Williams, however, has recently testified to the fact, from experimental observation, that the young escape from the ova before they leave the body of the parent, and are endowed with independent powers of locomotion.

[4] See also M. Morren's Treatise *De Lumbrici terrestris Historia Naturali nec non anatomica*. Brux., 1829.

[5] Hoffmeister has published some valuable researches regarding the various species of earth-worm, in his work, *De vermibus quibusdam ad genus Lumbricorum pertinentibus*, Berol., 1842. To the genus *Lumbricus*, properly so called, he assigns six species, viz., *Lumb. agricola, rubellus, anatomicus, riparius, olidus,* and *agilis*, all of which occur in North Germany.

In the genus *Hypogæon* of Savigny, each segment is furnished with an additional seta on its dorsal surface, and the setæ are long, spiny, and sharp-pointed. The body in form and colour greatly resembles that of the common earthworm, but the segments are less numerous, not exceeding 106, whereas those of the latter amount to 120 and upwards. The only species with which we are acquainted is *Hyp. hirtum*, first observed in the neighbourhood of Philadelphia.

Genus Nais, Linn. Body elongated, linear, flattened, transparent or semi-transparent, and in general provided with lateral ciliæ, simple or in tufts. Segments less distinctly marked than in the earth-worm.

The synonymy of this genus is very confused, its nature and attributes obscure, and its position in the system consequently various, according to the views of different observers. The name, borrowed from the heathen mythology, was first applied by Muller, and was generally adopted by contemporaneous, as it has been by succeeding, naturalists. It was written *Naias* by Bruguière (in *Encyc. Méthod.*), an erroneous alteration, in so far as the latter term had been previously consecrated by Linnæus to a genus in botany. Lamouroux increased the confusion by bestowing the name of *Naisa* on a polypus genus of the family of *Tubularia*, already known by the title of *Plumastella;* and the resemblance of the two names has induced some compilers to refer to them as synonymous, although they in fact signify objects belonging to separate classes of the animal kingdom.

Lamarck and Cuvier, in preserving the name of *Nais* to the subjects of our present notice, do not agree regarding their relations to other groups. The former author places them in the third or concluding order of his class Vermes (*Vers hispides*), thus disposing them between the genus *Gordius* and the *Epizoariæ*. His reason for so doing is, that the structure of the Naides is by no means sufficiently composite to entitle them to a place among the true Annelida; and the fact of their being capable of multiplication by incision, shows that their nature is somewhat anomalous in relation to the last-named class. We may bear in mind, however, that notwithstanding the observations of Trembley and Roesel, their *tomiparous* generation is doubted by Bosc, and denied by Dr Williams; and, all things considered, they may be regarded as more nearly related to the genera *Nereis* and *Lumbricus* than to any other.

The Naides in general are small vermiform creatures, of a few lines in length, of a reddish colour, though diaphanous, extremely active in their movements, and of a voracious disposition. They abound in fresh waters, where some dwell upon aquatic plants,—others beneath stones, or in perforations in the mud. They prey on minute Crustacea, such as the genus *Daphnia*, and on the still minuter animalcular tribes, and are themselves greedily devoured by the fresh-water polypi, which swallow them up, notwithstanding the pointed ciliæ with which their sides are armed. These ciliæ, however, and other apparently indigestible portions, are afterwards disgorged by the polypi, in the same manner as owls and other birds of prey reject from their stomachs little rounded pellets of hair and feathers.

The productive powers of the Naides, by whatever process accomplished, are truly astonishing. They appear in countless thousands in the waters of marshes after the lapse of a few hours, prior to which only some solitary individuals were perceptible. The mouth in these animals is sometimes a simple cleft, sometimes an opening, accompanied by two lips. The *N. proboscidia* of Gmelin, being provided with a trunk, forms the genus *Stylaria* of Lamarck; while certain anomalous species, such as *Lumbricus tubifex* and *marinus* of Muller, constitute the conterminous genus *Tubifex* of the former author. They dwell in perforations in the mud of streams and marshes, and in the sand of the seashore. We may conclude by observing, that the nervous system of the Naides is but obscurely known, and that the ocular points on the heads of certain species, though vaguely named eyes, cannot with actual certainty be regarded as organs of vision.

Genus Climena, Lam. Head without tentacula or other appendages. Body cylindrical, composed of few segments, somewhat swollen about the middle, and attenuated at either end. The posterior extremity is truncated and radiated.

These creatures inhabit fixed tubes of a cylindrical form and membranous texture, open at both ends. Our illustration represents *Cl. amphistoma* (fig. 17), a species taken in the Gulf of Suez, and indigenous to the shores of the Red Sea. Its tube is composed exteriorly of grains of sand and fragments of shells, and is usually attached to the interstices of rocks, or to Madrepores and other productions of the sea.

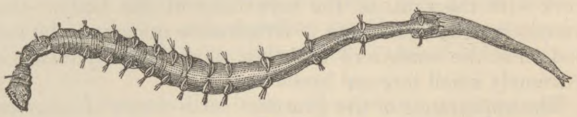

Fig. 17.

FAMILY II.—ABRANCHIA ASETIGERA.

This family comprehends such of the abranchial order as are unprovided with setæ, and is constituted by the old genera *Gordius* and *Hirudo* of Linn., of which all the distinctly-known species are aquatic.[1] Dr Williams is of opinion that although all the Annelida may be comprised in the twofold division of branchiata and abranchiata, such distribution would be neither convenient nor unobjectionable. Several species exist, such as those of the genus *Syllis*, in which the soft pedal appendages do not contain any specially organized branchial element. But the proposition is anatomically true, that the Annelida are really divisible into such as *have* and such as *have not* external and apparent branchial organs. The bipartite arrangement, long since propounded by M. Dumeril, of *Crypto-branchia* and *Gymno-branchia*, proceeded on this conception; the former term, however, being inaccurate, in so far as there is actually no species in which the branchiæ are internal or concealed. Respiration, according to Dr Williams, in all those destitute of external appendages, *is* performed internally, but not by any specially constructed organs. The function, under such circumstances, devolves either upon the general walls of the alimentary canal or external surface of the body, or it is enacted by the fluid which, in nearly all the abranchiate genera (except the leech and earth-worm), occupies the peritoneal cavity. All the external branchial appendages may be sub-divided into two chief divisions. In one, the organ is constructed with special reference to the exposure of the blood-proper to the agency of the respiratory element; in the other, the branchia is a mere hollow process filled with the chyle-aqueous fluid of the cavity just named.

---

[1] We do not exactly know what species of the lower tribes is alluded to by Sir T. S. Raffles in one of his letters descriptive of an excursion from Bencoolen. "I must not omit to tell you, that in passing through the forest, we were, much to our inconvenience, greatly annoyed by *leeches;* they got into our boots and shoes, which became filled with blood. At night, too, they fell off the leaves that sheltered us from the weather, and on awaking in the morning we found ourselves bleeding profusely. These were a species of intruders we were not prepared for." Another species of land leech is said to inhabit Madagascar, where it occurs on plants. It seizes greedily on the legs of the passers by, and sucks their blood.

It has been affirmed, as a law of the organization in all abranchiate Annelida, that the system of the blood-proper is more developed on the parietes of the intestinal canal than on the integuments. This fact, whenever the peritoneal space is obliterated by the adherence of the intestinal cylinder to that of the integument, transfers the office of respiration from the latter to the former region; that is, as is practically demonstrable in the instance of *Nais filiformis*, the large volume of water which is incessantly streaming throughout the length of the alimentary canal, holding atmospheric air in solution, while it ministers by its organic particles to the nutrition of the system, contributes also by the air with which it is mixed to the great purpose of aërating the living fluids of the organism.

We may now observe that leeches in general (Hirudines) are characterized by an oblong body, sometimes depressed, transversely wrinkled, and furnished with a dilatable cavity at either extremity—that is, the mouth is surrounded by a lip, and the posterior end is provided with a flattened disk. These latter parts are useful as organs of prehension and locomotion, and also act as suckers. The mouth, placed in the anterior cavity, is furnished with three jaws.

These useful vermes were probably known in very ancient times. The *Halukah* or *Gnalukah* of the Hebrews appears to have been one of this tribe, at least the term has been so translated in our versions of the Proverbs, ch. xxx., v. 15: "The horse-leech hath two daughters, crying, Give, give." The Greek writers make mention of them under the name of *Bdella*, and the Latin authors under those of *Hirudo* and *Sanguisuga;* but the ascertainment of the precise species indicated is by no means easy. After the revival of learning we have various general notices of their history and habits, although it was so late as the time of Linnæus before we attained to any knowledge of their specific distinctions. The Swedish naturalist (in his *Fauna Suecica*) described eight species, and numerous additions have been made in more recent times. For a long period the genus *Hirudo*, as founded by Ray and adopted by Linnæus, experienced no sub-division; but the labours of Leach, Oken, Savigny, Lamarck, and others, have shown the propriety of re-arranging a group, consisting no doubt of natural constituent parts, but composed of beings exhibiting a varied range of structure, and too much extended for the formation of a genus, properly so called.

The structure of these creatures is soft and contractile, composed of a great number of articulations, and generally invested by an abundant supply of mucous moisture. The anterior cavity, which contains the mouth, is named *capula* by Savigny, while the posterior disk bears the name of *cotyla* in the nomenclature of that author. On the anterior segments certain small black points are observable, which are regarded as fulfilling the functions of eyes. They vary in number in the different genera, from two to ten. Various experiments have been made with a view to the ascertainment of their sense of sight. If we place leeches in a vessel surrounded by black paper, and permit the light to enter only by means of a single small orifice, they are by no means slow in directing themselves to that point;—but this observation we deem to be in no way conclusive, in as far as light produces an efficient action and a directing influence, not only upon many of the lowest tribes, which we know to be destitute of eyes, but even upon the subjects of the vegetable kingdom. M. Moquin-Tandon however asserts, that having placed a small piece of red-coloured wood in front of *Nephelis vulgaris*, it evidently turned round on purpose to avoid it.[1] Their perception of the sense of touch is delicate, although they possess no special or circumscribed organs for its reception. The sense of taste is obvious,—that of hearing and of smell imperceptible. No odour affects them,—no sound seems to produce any influence; nor can we detect any organs which may reasonably be deemed the seat of these last-named functions.

The tegumentary system of leeches has been examined in detail in very few species. In the medicinal leech three parts are, however, distinguishable—the epidermis, an intermediate layer which is the seat of colour, and the dermis. The epidermis is extremely fine and delicate, perfectly colourless, and remarkably deciduous, that is to say, it is frequently renewed, even as often as once in every four or five days in warm weather. It adheres intimately to the lower layer, but not by its entire extent—being frequently free between the rings of which the body of the creature is composed. When detached we perceive that it is perfectly transparent at the points which adhered to the coloured layer, and slightly opake, or even of a whitish colour where it became unattached in passing from one segment to another. Under the microscope it is seen to be pierced by an infinity of small holes, through which a mucous liquid flows, which lubricates the surface. The coloured layer, or *pigmentum*, adheres strongly to the dermis on which it lies. The hues which it exhibits are very different according to the species,—sometimes they are dark and uniform, but usually lighter on the under than the upper surface; sometimes the ground colour is varied by spots or streaks of different intensities, while the pigment, if we may so express it, is occasionally almost colourless, and we may then perceive distinctly through the skin all the interior organs of the body. The dermis, or deepest layer, exhibits a curious organization; it consists of a thickish tunic, presenting an appearance of distinct circular articulations, which produce the ringed or wrinkled aspect of the external surface. The spaces which exist between these rings are covered by the epidermis, and seem intended to facilitate the varied movements of the animal.

Beneath the skin, of course, are placed the muscles. We find first a layer of transverse fibres, which adheres intimately to the dermis. This layer covers other muscles, of which the direction is longitudinal; and beneath these we find some more, of which the direction is again transverse.

The *capula* or oral sucker is formed by two extensile lips—the one superior, usually large, sometimes almost lanceolate; the other inferior, and less advanced. Within it are placed the jaws, rarely wanting, and usually three in number, disposed triangularly, and fixed upon a corresponding number of little tubercles. Their consistence is slightly cartilaginous, their form almost lenticular, and their margin, free and cutting, is sometimes smooth, sometimes furnished with a double row of dentations, more or less numerous according to the different kinds. A sort of cartilaginous ring, which frequently surrounds the base of the tubercles, indicates the opening of the intestinal canal, which commences by a species of œsophagus more or less narrow, presenting occasionally some longitudinal folds, but never any lateral pouch-like swellings. The ensuing portion or stomach, on the contrary, usually exhibits throughout its entire extent expansions more or less perceptible, according to the state of repletion. In certain species (such as *Clepsina complanata*) these lateral appendages are never effaced, but constitute permanent cæca. The rectum is generally separated from the stomach by a valvular contraction. The anal opening is on the back, at the origin of the posterior sucker, called *cotyla* by Savigny. The digestive canal is throughout composed of two pellucid tunics, and towards its extremity some muscular fibres are perceptible. Although the existence of a liver in the leech tribe is not so ascertained as to be at all generally admitted (indeed it is denied by some, and doubted by many), yet M. Blainville describes an apparatus for the secretion of bile, consisting of a cellulo-membranous tissue surrounding a portion of the stomach and intestine.[1]

---

[1] *Monographie de la famille des Hirudinées.* Montpellier, 1826, in 4to.

All leeches are blood-thirsty and voracious, and support themselves by sucking the life-blood of other animals. Their powers of digestion and assimilation are, however, extremely slow; and hence, probably their reluctance to repeat their operations for behoof of a patient, when their doing so is neither pleasant nor profitable to themselves. After the lapse of days, weeks, and even months, portions of the liquid or solid matters which they may have swallowed are found to remain in the intestinal canal. The kinds used in medicine, moreover, offer this peculiarity, that the blood which they have sucked does not seem to experience any sensible alteration in their stomach, but maintains its natural colour and fluidity. If, however, the leech dies, or the blood is exposed to the air, it speedily coagulates, and becomes of a blackish brown.

In regard to the *bleeding* of leeches, M. Olivier (*Journal de Chirurgie par Malgaigne*, 1844, Mars., p. 88), has proposed the following procedure:—When fully gorged, the creature should be punctured with the point of a lancet in one of the transverse wrinkles of the back, at the termination of the first third of the length of the body, the incision being made parallel with it, between the vein and artery, and in a direction from the anterior backwards. The wound is to be two millimetres in length, and the leech is to be afterwards placed in lukewarm water; in which, by its own contractions, which may be assisted by pressure with the fingers, all the blood which it has sucked escapes through the wound. It should afterwards be placed in rain or river water. It is said that, notwithstanding the carnivorous nature of these creatures, they are benefited by having access to the plant called *Ranunculus aquaticus.* The young are alleged to feed upon its leaves. On contemplating the singular dental apparatus of the leech, and considering the nature of the food (we presume minute aquatic animals) on which it usually subsists, Mr Rymer Jones finds it difficult to avoid the conclusion that such a structure is rather a provision subservient to the alleviation of human suffering, than necessary to supply the wants of the animals themselves. It is certain that in the streams, ponds, and marshes where they usually inhabit, an opportunity of sucking any warm-blooded animal, whether man or beast, must be extremely rare, so that they can but seldom exercise their instinctive love of blood. Neither does it appear that the fluid which they swallow so greedily is fitted to their constitution; for, although it is true that it remains for a considerable time in their interior without corrupting, yet it is well known that the death of the leech is generally caused by the indulgence of such inordinate repletion, provided the greater portion of what has been swallowed is not speedily regurgitated through the mouth.

The nervous system of the leech tribe has been described in some detail by several authors, especially that of *Sanguisuga officinalis*, *Hæmopis vorax*, *Nephelis gigas*, and *Albione muricata.* It is composed of a series of ganglions, extending from the mouth to the extremity of the body, and placed, as among the other articulated classes, beneath the alimentary canal. From each ganglion proceed nervous threads, which ramify *ad infinitum* to the other parts.

The circulating system of leeches has been the subject of still more numerous researches. It is probably more highly developed among these animals than in any other Annelida. In this class the presence or absence of a heart, or heart-like centre, is by no means the true criterion of its amount of evolution. The quantity of blood relatively to the size of the body, the degree of capillary subdivision on the periphery of the blood system, and the proportion of the latter to the peritoneal fluid, give true indications. In the leech there exists no free space between the intestine and the integument, and so the chylous fluid, which in nearly all the other Annelida occupies the general cavity of the body, is transferred into the *interior* of the lateral diverticula of the stomach. We shall here briefly notice the labours of some foreign physiologists. MM. Thomas,[2] Cuvier, Carena,[3] Moquin-Tandon, Dugés[4] and Audouin,[5] have signalized themselves in this laborious field. All the species hitherto examined have presented four longitudinal vascular trunks—one dorsal, another ventral (these two being separated by the alimentary canal), and two lateral. These principal organs communicate with each other, not only by the capillary vessels which meet and intermingle in the different parts to which they are distributed, but also by special branches of considerable diameter, which proceed directly from one vascular trunk to another. The ventral vessel furnishes large branches, which, mounting vertically on either side, embrace the intestinal canal, and open on the dorsal vessel. Dugés names these the *abdomino-dorsal branches.* The lateral branches communicate with each other by means of transverse branches, which pass beneath the medullary cord. These branches have been well figured and described by Jean Muller (in *Archiv. fur Anat. und Phys.* Jan., Marz., 1828), and Dugés names them *latero-abdominal branches.* Lastly, these lateral trunks also send large branches to the dorsal vessel, which bear the designation of *latero-dorsal branches.* In addition to these canals, which thus establish a direct connection between the principal trunks, each of the latter gives rise to an infinite number of small vessels, which carry the blood to the various parts, and especially to the skin, which may be regarded as the principal, though not the sole organ of respiration. That other organ, to which we now allude, consists of certain pouches, amply provided with blood-vessels, which form a net-work on their coats, and proceed from the subdivision of a vessel furnished by the latero-abdominal branches, as well as of a large vascular pouch or bag called pulmonary by Dugés, and which is derived from the lateral trunk. In a species of *Albione* dissected by M. Audouin, the lateral vessels were perceived to be in direct communication with the respiratory pouches by means of two branches, one of which is anterior, the other posterior. He also observed that numerous branches sprang from the anterior portion of the dorsal vessel, and proceeded partly to the pouches, and partly to the lateral trunks. Thus the pouches communicate at the same time, both with the dorsal and lateral vessels. In accordance with these views, the process of circulation is supposed to be as follows:—The lateral trunks are regarded as great veins, which receive the blood from all parts of the body, and transmit it to the respiratory pouches, in which it becomes re-oxygenated; a small portion then flows back to the lateral vessels, while the greater portion enters the dorsal vessel, and then the ventral one, both of which assist in propelling it to all the other parts of the body, from whence it returns to the lateral branches, and thence flows to the respiratory pouches as aforesaid. We must add, however, that M. de Blainville and others deny that the pouches or vesicular sacks just mentioned are of a pulmonary nature.[1] They regard them rather as secreting glands; and it is certain that respiration is carried on in great part through the medium of the skin, or rather that the function of breathing falls on the *united* structure of the intestine and integument. Various kinds of leeches may be often seen fixed by their posterior sucker, and swinging themselves to and fro for hours and even days together, their bodies being at that time more than usually flattened in order to render the motion more effective. They are then respiring after the manner of the Naids, by bringing their cutaneous system into constant contact with a fresh supply of water. During this singular process the pulmonary pouches are almost quite inert, and their sanguineous vessels scarcely perceptible, while the *cutaneous* network, on the contrary, is in full and remarkable activity.

Leeches are hermaphrodites, like others of their class; but sexual union of separate individuals is indispensable to the process of fecundation. Although in many of their more obvious characters they so nearly resemble the Planariæ, they stand too high in the scale to be capable of reproduction by excision or the cutting of parts. A variety of opinion exists among naturalists regarding the mode of production, whether by eggs or living young. It is probable that such as do not appear to lay eggs are merely ovo-viviparous, and bring forth their young alive, after they have been hatched in the body of the parent. The majority of species in truth lay *oviferous capsules*, each containing several germs. Certain kinds of *Clepsina* are distinguished by a small and peculiar pouch in the abdomen, in which the young seek protection during infancy. They attain to full size rather slowly, and the duration of life is considerable, though not distinctly known. Medicinal leeches have been kept in life for a period of eight years; and it has been inferred that if, with the disadvantages of confinement and irregular supplies of food, they survive so long, their natural term of life must be much greater. This, however, we regard as an inconclusive, if not erroneous mode of reasoning; for we know that among insects and other classes of the more lowly organized departments of animal life, abstinence, and the non-fulfilment of their natural instincts, are uniformly found to prolong their period of existence.

The leech tribe in general is widely distributed over the earth's surface, although, as usual, each species has its own range of localities.[2] Our medicinal kinds seem proper to Europe, although they extend from Russia to the southern point of Spain. All the species are extremely sensible of atmospheric changes. They become agitated during high winds, and often bury themselves in the mud during cloudy weather. Some fanciful observers have even kept them in confinement, that they might serve to indicate the state of the atmosphere; but we incline to think that it is fully as useful, and not more troublesome, to look out of a window than into a phial. On the approach of cold weather they sink into the mud, and pass the winter in a state of lethargy.

We shall now proceed to a brief consideration of the principal genera into which the tribe has been partitioned by modern naturalists.

GENUS SANGUISUGA, Sav. Oral sucker consisting of several segments. Upper lip almost lanceolate. Aperture transversal. Jaws three in number, compressed, and each armed on their cutting edges with two ranges of fine teeth. Eight or ten black points (regarded as eyes) disposed in a curved line; the posterior four more isolate.[3] Anal sucker obliquely terminal.

This genus contains the leeches properly so called, that is, the medicinal kinds; and, according to Savigny, consists of three species. Some recent additions, however, have been made to these by MM. Moquin-Tandon and Carena.

H. medicinalis (fig. 18) of naturalists is the most common kind, and that most frequently used for blood-letting purposes. It occurs throughout the fresh-water marshes of Europe, and measures from four to five inches in what may be called its medium state, although capable of both contraction and extension within and beyond those limits. Its body, including the anterior sucker, is composed of ninety-eight rings, and is of a deep-green colour on the back, with six reddish bands, three on each side. The two inner bands are almost spotless; the two central ones are marked by a chain of small spots and points of velvet-black; the exterior bands are marginal, and each subdivided by a black fillet. The abdomen is of an olive colour, broadly bordered and spotted with black. Savigny distinguishes, under the name of *S. officinalis* (it is the *H. provincialis* of Carena), another species, likewise used in medicine, and frequently confounded with the preceding (fig. 19). It is vulgarly known as the *green leech*, and resembles

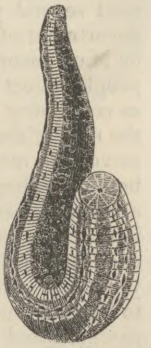

Fig. 18.

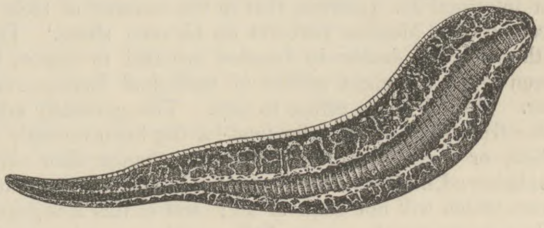

Fig. 19.

---

[1] Cuvier seems to express no very decided opinion on the subject above referred to. "On voit dans plusieurs en dessous du corps deux séries de pores, orifices d'autant de petites poches intérieures que quelques naturalistes régardent comme des organes du respiration bien qu'ils soient la plupart du temps remplis d'un fluide muqueux" (*Règne Animal*, t. iii., p. 213). Dr Williams has more recently shown that the so-called pulmonary vessels are in fact ovario-uterine organs.

[2] We observe it stated in several continental works of authority, that leeches are unknown in, or at least not indigenous to, the western world. We were inclined *a priori* to doubt the accuracy of this statement, and lately instituted some inquiries on the subject, in which we were aided by an excellent physiological naturalist, Dr Allen Thomson. We find that in the Dispensatory of the United States, by Drs Wood and Bache (published at Philadelphia in 1833), there is a description of a true American medicinal leech. These authors state, that at New York, Boston, and elsewhere, European leeches, that is, the gray and green varieties of the *Hirudo medicinalis* of Linnæus, are chiefly employed, and are imported in great quantities; but that in Philadelphia and the neighbourhood the indigenous *Hirudo decora* is used. It is this species which is described in Major Long's *Second Expedition* (vol. ii., p. 268). The back is of a deep pistachio-green colour, with three longitudinal rows of square spots, twenty-two in number, and placed on every fifth ring. The abdomen is spotted with black. This kind usually measures two or three inches in length, occasionally attaining to the extent of four or five inches. It is carried to Philadelphia by the country people from Bucks and Berks county. It is said to draw less blood than the European leech, and does not cut so deeply. About three American do not more than correspond to a single European leech in their suctorial powers.

[3] The eyes of leeches are easily detected by the assistance of a lens, under the form of a semicircular row of black points, situated above the mouth, upon the sucking surface of the oval disk, a position evidently calculated to render them efficient agents in detecting the presence of food. According to Professor Müller, they do not exhibit any apparatus of transparent lenses adapted to collect or concentrate the rays of light, but each *ocellus*, or visual speck, would seem to be merely an expansion of the terminal extremity of a nerve

the common kind in size, and the number of its segments; but the colour of the back is not so sombre, and the abdomen is of a more yellow green, and, though bordered with black, is without spots. The six anterior eyes are very projecting, and have more truly the appearance of organs of vision. The third species mentioned by Savigny is the *S. granulosa.* It was brought by M. Leschenhault from Pondicherry, where it is used in blood-letting after the manner of our European kinds. *S. obscura* and *interrupta* are both described by M. Moquin-Tandon as indigenous to the vicinity of Montpellier; and *S. verbena* of Carena occurs in the Lago Maggiore.

With the exception of the last-named species, and that from Pondicherry, M. Blainville refers all the others to the *H. medicinalis* of Linn., of which, according to his peculiar views, he establishes five varieties; the grey, the green, the spotted, the black, and the flesh-coloured. With that love of change for which too many modern naturalists are remarkable, he names the genus *Jatrobdella.*

We have already mentioned that leeches are abundant in all the countries of Europe. France furnishes an immense supply, and their collection in some of her provinces affords the materials of an important branch of commerce. Some curious details on the subject were read several years ago to the agricultural society of the department of Seine-et-Oise. Towards the month of April or May, according to the nature of the season, the country people collect the cocoons or capsules formerly mentioned as containing the eggs. These they find in abundance in the mud of shallow marshes, and convey them to various reservoirs in other quarters, so as to spread and propagate the breed. They do not use them commercially till they are about eighteen months old. Leeches are very numerous in the lakes and marshes in the neighbourhood of Nantes; and their collection is carried on throughout the whole year, but chiefly during summer.. They are transported to Paris in linen bags, each containing about 500, placed in panniers, and surrounded by wet moss. During a favourable season the dealers of Nantes will sometimes receive at the rate of fifty thousand every day; and a Parisian druggist informed M. Audouin, that in the summer of 1820 he received from Moulins 130,000 for his own share.[1] Four of the principal dealers in London are said to import between seven and eight million of medicinal leeches every year. Many leeches refuse to bite. This generally arises either from their appetite for food having been recently satisfied, or from their being about to change their skins. It is believed, however, that capricious individuals sometimes occur, which will not suck at all; and of this it is impossible to ascertain the cause. Inflammation occasionally follows the infliction of the bite, and in this case a vulgar prejudice exists that a horse-leech has been applied. This is in every way an error, for the horse-leech refuses to fasten upon the human body. The means used for the preservation of leeches in confinement are various. The most common mode consists in placing them in a bottle of water frequently renewed. Some apothecaries find advantage from placing moss or aquatic plants at the bottom of the vessel, which aid in freeing them from slime. The chief dispenser of the marine hospital of Rochefort keeps his leeches simply in moistened clay, in which the creatures form holes and galleries, where they live happily for years.

Mr Brightwell states that a dealer in Norwich keeps a stock of about 50,000 in two large tanks of water, floored with soft clay, in which the creatures burrow. On examining these tanks he found many capsules or ova deposits of the leech, which the owner, ignorant of their nature, stated to be at times very numerous, but which he neglected, and indeed generally destroyed.

(The curious in leeches may consult the following works, in addition to those already quoted:—*Histoire Naturelle et Medicale des Sangsues,* &c., par T. L. Derheims, 8vo, Paris, 1825; *Observations sur la conservation et la reproduction des Sangsues,* par Chatelain, 8vo, Paris, 1826; *Monographie des Sangsues Medicinales et Officinales,* par A. Charpentier, Paris, 1838; *Sur la Multiplication des Sangsues,* par T. B. Hazard, 8vo, Paris, 1841. See also some observations *On the Minute Anatomy of the Horse leech,* by J. E. Quekett, in the *Zoologist,* pp. 17, 88, 324.)

GENUS HÆMOPIS, Sav. Differs from the preceding chiefly in the jaws being not compressed, and furnished with less numerous dentations.

H. sanguisorba, Sav. *(Hirudo sanguisuga,* Linn.), commonly called the *horse-leech,* is a well-known species, somewhat larger than the medicinal kinds, and of a uniform greenish-black colour. A great diversity of opinion seems to exist regarding the blood-drawing propensities of this species. Many allege that it causes wounds extremely dangerous both to man and beast. Linnæus asserts that nine will kill a horse. MM. Huzzard and Pelletier, on the other hand, maintain that the horse-leech, improperly so called, never attacks any vertebrated animal whatever;[2] while M. de Blainville again is of opinion that these writers have mistaken their subject of observation, and have described the black leech (his *Pseudobdella nigra*), which is truly characterized by the jaws being nothing more than folds of toothless skin, and may therefore be inferred to confine its attacks to the lower orders of creation. We agree with Cuvier in thinking that the subject deserves a fresh examination. In addition to the common species, Savigny describes three other kinds,—*H. nigra, luctuosa,* and *lacertina.*

GENUS BDELLA, Sav. Dentations of the jaws entirely wanting. Eyes only eight in number.

As far as we know, this genus consists of only a single species, the *Bd. Nilotica* (fig. 20), found in Egypt, and familiar to the Arabs under the name of *Alak.* It appears to have been known to the ancients; and Herodotus (*Hist.* lib. ii., cap. 68) describes it as a parasite of the crocodile. It is of a chestnut-brown colour above, of a lively red below.

GENUS NEPHELIS, Sav. In this genus the eyes are also only eight in number, the four anterior being disposed in a crescent form, the four posterior ranged on each side on a transverse line. The jaws are reduced to three simple folds.

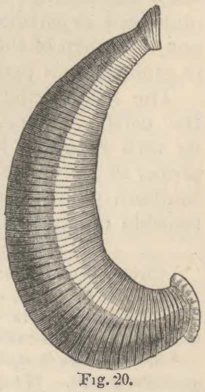

Fig. 20.

Savigny describes three species, *N. rutila, testacea,* and

---

derived immediately from the brain, spread out beneath a kind of cornea formed by the delicate and transparent cuticle, behind which is a layer of black pigment, to which the dark colour of the ocular points is due. We ourselves entertain no doubt that leeches have eyes, but the evidence (from written authorities) is very contradictory. Weber was the first to show the true nature of the black specks in *H. officinalis* (Meckel's *Archives,* 1827, p. 301). More recently Wagner (*Lehrbuch d. vergleich, Anat.* 1835, p. 428) has described, in the interior of the pigment layer, a transparent body, composed of two parts, which he regards as consisting of a crystalline lens and a vitreous portion. Brandt has even traced the ten optic nerves from the brain to the eyes (*Med. Zool.* i., p. 250). On the other hand, Moquin-Tandon, in the revised edition of his work (*Monographie des Hirudinées,* Paris, 1846), states that these black specks contain neither lens nor vitreous humour, although they are light-receiving organs; while Leydig (in Siebold and Kolliker's *Zeitsch.* i., 1849, p. 103) goes so far as to assert, in relation to the alleged eyes of the parasitical genus *Piscicola,* that they neither receive a nerve, nor contain a light-refracting body. He regards them as simple ornaments, analogous to the corresponding pigment dots on the pedal shield, with which they also correspond both in colour and distribution.

[2] *Journal de Pharmacie,* Mars 1825.

cinerea. The two former occur near Paris; the last named is frequent in the marshes of the forest of Fontainebleau. Of *Nephelis tessellata,* Müller observes that the female is sometimes found filled with 300 young. *N. vulgaris* is frequent in our fresh waters, and the brown capsules containing the ova may be found on the underside of the leaves of many water plants, among the ova of the *helices.* Mr Brightwell kept several species through the summer, and carefully observed the deposition of the ova, and development of the young. On the 2d of June *N. vulgaris* deposited one capsule containing ova, on the 5th another, on the 10th a third, and on the 15th two more, each containing from seven to ten eggs. On the 22d the young appeared in the capsule deposited on the 2d, and on the 13th July they emerged from the capsule, and in six weeks they left it, fully developed. He detected rotiferous animalcules in their stomach.

The genus Trochetia of Dutrochet does not seem to differ from the preceding, except by an enlargement near the position of the generative system. One species (*Geobdella trochetii* of Blainville) comes on shore in pursuit of earth-worms. Another minor genus has been established by M. Moquin-Tandon, under the name of Aulastoma. The jaws are represented by numerous projecting folds. The eyes are ten in number. We may here also mention M. Odier's genus Branchiobdella, of which the jaws are two in number, and the eyes wanting. It inhabits the gills of cray-fish.[1]

In all the preceding groups or genera of leeches, the anterior sucker is but slightly distinguishable from the adjoining portion of the body; but in the two following genera it is rendered more perceptible by a restriction, and is composed of only a single segment. In the genus Hæmocharis of Savigny, the eyes are eight in number, the body slender, and indistinctly ringed. The species do not swim, but march after the manner of the *surveyors* or geometric caterpillars. They attach themselves particularly to fishes. The genus Albione of the same author differs from the preceding in its body being beset by tubercles, and in possessing only six eyes. The species inhabit the sea. We may mention, as an example, the *Hirudo muricata* of Linn.

The genus Branchellion of Sav. is distinguished by what some regard as projecting branchiæ. The epidermis is loose and ample, and seems to enclose the animal as in a sack. The species are parasitical, and attach themselves chiefly to fish of the torpedo kind. With the leeches, Cuvier also places the genus Clepsina, Sav., which is characterized by a broadened body, possessing only a posterior sucker. The anterior portion is a simple orifice, without any appearance of the usual disk. The species make a near approach to the *Planariæ,* and the one represented by the annexed cut was described and figured by Mr Kirby, under the name of *Hirudo crenata* (fig. 21).[2] The development of the ova in this genus has been described by Grube.[3] *C. complanata* usually deposits from five to seven ova, enveloped in a very transparent, soft, succular egg-case, while in *C. bioculata* there are only three or four, and in *C. marginata* only a single ovum in each capsule. These egg-cases are glued by a peduncle to water plants, and continue hanging thereto, but the young, when excluded, attach themselves to the abdomen of the mother. Other genera, allied to the preceding in their enlarged form and absence of the oral disk, have been established by Oken and Blainville. Of these, however, we cannot give account within our prescribed limits, and we shall therefore conclude the present treatise by a short notice of the more distantly related,

Genus Gordius, Linn. Body filiform, smooth, or with very slight transverse markings. Neither branchiæ nor tentacula of any kind.

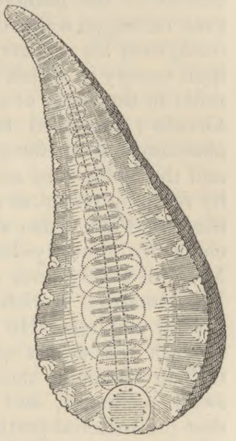

Fig. 21

A well-known species of this genus (*G. acquaticus,* Linn.) is distinguished in this country by the name of the *hair-eel.* It occurs in springs and marshes, and among moist sand, and also dwells in mud, which it perforates in all directions. It is believed by some to be parasitic in the abdominal cavity of many insects. A list of these latter, so infested, has been published by Professor Siebold (*Entomologische Zeitung.* Yahrg. 1843, p. 77). The position of the genus is variously regarded by different naturalists, and the extreme tenuity of form in these creatures has probably opposed obstacles in the way of a precise knowledge of their structure. The nervous system being composed of a ganglionic cord, seems, however, a strong reason for placing them among the Annelida. We follow the Baron Cuvier in so doing, although we are aware that Rudolphi and Blainville combine them with the genus *Filaria,* which contains the noted Guinea worm (*F. Medinensis*), and is usually regarded as belonging to the intestinal class. (J. W.)

[3] *Zur Anatomie und Physiologie der Kiemenwürmer,* Königsberg, 1838.

HELMONT, Jean Baptiste Van, a celebrated chemical inquirer, was born at Brussels in 1577. He was educated at Louvain, and began the study of natural science under the Jesuits in that city. Their hard and dry philosophy, however, had few attractions for a nature so ardent and imaginative as his. Turning for relief to other systems, he found no rest except in the mysticism of à Kempis and Tauler. From them he learned that wisdom is the gift of the Supreme Being; that it must be obtained by prayer; and that we must renounce our own will if we wish to participate in the influence of the divine grace. From this time he began a life of exemplary meekness and humility, made over his property to his sister, and retired from the high society in which he had hitherto walked. He sought relief in the study of medicine; pored over Galen and the Greeks; mastered them, and finding their inadequacy, abandoned them for ever. He then turned to Paracelsus and the alchemists, and conferred a real boon on humanity by rescuing chemical science from the erratic absurdities of the post-Paracelsian alchemists, and applying to it the principles of the newly-discovered induction. He graduated as M.D. in 1599; and, after travelling through France and Italy, married a rich lady of Brabant, by whom he had several children. He died in Holland in 1644 in the sixty-seventh year of his age. Science is under real obligations to Van Helmont, though at one period of his life he was a sworn alchemist, and revived the old doctrine of Thales, that the material particles of the universe consist essentially of nothing but water. To him is due the invention, or at least the first application, of the term *gas* in the sense in which it is now used. He also discovered that gas was disengaged in abundance by the application of heat to various bodies, and during the solution of various carbonates and metals in acids. His theory of the formation of urinary calculi is also nearly correct.

The personal character of Van Helmont, as given by his biographer Lobkowitz, is interesting:—"He was pious, learned, famous, a sworn enemy of Galen and Aristotle. The sick never languished long under his hands, being always killed or cured in three days." His works were published at Amsterdam in 1648 by his son Mercurius, who aspired to rival his father, and is described on his tombstone as being *nil patre inferior*. The best edition of these is that of Elzevir, 1652.

HELMSLEY, a small market-town of England, North Riding of Yorkshire, on the Rye, 21 miles N. of York. The inhabitants are chiefly employed in agriculture and the linen manufacture. Helmsley Castle, now in ruins, was built in the time of Edward I. and Edward II., and was taken and dismantled by Fairfax in the civil war. Pop. of township (1851) 1481.

HELMSTEDT, or Helmstadt, a walled town of Germany, duchy of Brunswick, on the high road from Brunswick to Magdeburg, 20 miles E. of the former city. The ditches which formerly surrounded the town have been filled up, and converted into public walks, planted with trees. A university, founded here in 1575, was suppressed by Jerome Bonaparte in 1809, and a portion of its library transferred to Göttingen. The university building is now used as a court-house. The church of St Stephen and the town-hall are the principal buildings of the town. It is a place of considerable trade, and has manufactures of flannel, soap, hats, spirits, &c. Pop. about 6000.

HELMUND, a river of Afghanistan. See Afghanistan.

HELOS, in *Ancient Geography*, the name of several towns, so called from their position among, or near, *fens*. The most important town of this name was in Laconia, at the mouth of the Eurotas, in a plain close to the sea, marshy yet very fertile. In the Dorian conquest of the Peloponnese Helos was taken, and its inhabitants carried off to Sparta, and reduced to slavery. Their name is said to have been applied by their masters generally to all the bondsmen or helots that fell into their power. This, however, is a mere etymological fancy. (See Helot.) The name Helos is still given to the champaign country at the mouth of the Eurotas; and ruins, said to belong to the ancient town, are still visible near Bizani. Leake identifies Helos with *Priniko*; but as the remains there do not go further back than the middle ages, the first supposition is the more likely to be true.

HELOTS, in *Grecian Antiquity*, the serfs or bondsmen of the Spartans. Etymologically the word signifies, beyond doubt, a *captive* or *prisoner*, and is derived from the root ἑλ found in ἑλεῖν, ἥλων, and other verbs. A fanciful etymon of the word is mentioned under the art. Helos. (See Helos.)

The inhabitants of Sparta were classified under four general heads,—the Spartan citizens themselves; the Periœci, who enjoyed civil but not political privileges; the Helots, the serfs or bondsmen, *adscripti glebæ*; and the Neodamodes, who were Helots liberated by the state in reward for service in war, and who probably received some civil rights which entitled them to rank above the Periœci. Of these classes the Helots were the lowest. They were looked upon as the property of the state, which, though it made over their services to individuals, still retained the right of setting them free, as it might see fit. They were *adscripti glebæ*—attached to the soil, and could not be sold away from it. In time of peace they tilled the land, which was allocated in the proportion of one lot to six or seven families. For each lot they paid their masters an annual rent in kind—82 medimni of barley, and a corresponding quantity of wine and oil. The domestic servants of the Spartans were all Helots. In times of war the Helots used to share in the campaign as light-armed troops, and a certain number of them, varying from two to seven, was allotted to each Spartan hoplite. They were only allowed to serve as hoplites in great emergencies; but if they fought well they were generally rewarded with their freedom.

Much has been said of the cruel treatment to which the Helots were subjected by their masters; but it only holds true of the later history of Lacedæmon, when the number of Spartan citizens had been so reduced by continual wars that the Helots became an appreciable power in the state. There can be no doubt that originally their position was an enviable one beside that of the slaves in all the other states of Greece. Every care was indeed taken to distinguish between them and their masters, even in the matter of dress; but, as Grote observes, they formed "a part of the state, having their social and domestic sympathies developed, a certain power of acquiring property, and the consciousness of Greek lineage and dialect—all points of marked superiority over the foreigners who formed the slave population of Athens and Chios." But after the Messenian wars, when their numbers had made them formidable in the reduced state of the country, there is only too much reason to believe that no cruelty was held too severe to be practised towards them. The evidence is strong that the *Crypteia*, instituted ostensibly for the purpose of inuring the Spartan youth to hardship, was in reality intended to reduce the number of the Helots by assassination. It is known from Thucydides that the Spartans did not scruple to employ this method of keeping their slaves down when they became too numerous. On one occasion, when the Helots had rendered the state some great service, their masters, to try their temper, offered liberty to such as thought they had deserved it. Two thousand of the Helots, tempted by the offer, came forward to claim the reward, and were immediately put to death.

Helots, when emancipated, were known under the name of Neodamodes, or *newly-enfranchised*, and took rank next to the citizens proper. These Neodamodes were again subdivided into several classes, to which special functions were assigned.

Who the Helots were has been matter of much dispute; but it seems now agreed that they were the aborigines of Laconia, who at the time of the Dorian invasion were reduced to slavery by their conquerors. Their numbers were greatly increased at the close of the second Messenian War by the incorporation of the conquered Messenians, who were classed among the Helots, and subjected to all the hardships of slavery till their restoration by Epaminondas after the battle of Leuctra.

HELSINGFORS, a seaport town and naval station of the Russians in the Gulf of Finland, on a peninsula to the W. of the River Wanna, 180 miles W. of St Petersburg, 100 S.E. of Abo, and 60 N. of Revel; N. Lat. 60. 10., E. Long. 24. 57. It is the capital of Finland, the seat of the principal authorities, and an archbishop's see. It was founded by Gustavus I. of Sweden in the sixteenth century, burnt by the Russians in 1728, and again in 1741. In 1742 it was taken by the Swedes under Lewenhaupt. In 1808 it was defended by Admiral Cronstadt against the Russians; but after his unaccountable surrender of the fortress of Sveaborg, which defends the entrance to the town, Helsingfors, with the whole of Finland, was ceded to the Russians by the treaty of 1809.

Within little more than thirty years the town of Helsingfors has undergone a complete change. It is now regularly laid out in streets and squares, and adorned with public buildings. Of these the principal are the senate-house, governor's house, university, barracks, hospital, assembly rooms, and a handsome Lutheran church with four porticoes. Some of these, as well as the quay, are built of granite.

It was not till the destruction of Abo by fire that Helsingfors rose to importance. In 1819 the government, and in 1827 the university, were transferred from the old to the new capital. The university comprises 4 faculties, with 22 professors, and about 500 students. The library, which is kept in the senate-house, amounts to 80,000 volumes, containing the editions of the classics taken from the monasteries by Charles XII. Besides the library there are museums of mineralogy and zoology, botanic gardens, and an observatory, which commands a fine view.

Its trade in time of peace was considerable in grain, fish, deal and other wood, iron, &c. The inhabitants manufacture sail-cloth, linen, tobacco, &c. Pop. 16,000. (For the fortress of Sveaborg, see SVEABORG.)

HELSTONE, a municipal and parliamentary borough and market town of England, county of Cornwall, on the left bank of the Loe or Cober, 15 miles S.W. of Truro, and 276 from London. It was made a borough by King John, and a coinage town by Edward I. Previous to the Reform Act it returned two members to parliament. Among its public buildings are the market-house, town-hall, and old coinage-hall. The church is surmounted by a tower 90 feet in height, forming a conspicuous object at sea. Helstone has a grammar, national, and other schools. It is important as being the centre of an extensive agricultural and mining district. Market-days, Wednesday and Saturday. At Portleven, about three miles distant, a considerable export and import trade is carried on. Shoes are extensively made in the town. It returns one member to parliament. Pop. (1851), of parliamentary borough, 7328; of municipal borough, 3355; registered electors, 400.

HELVELLYN, one of the highest mountains of England, county of Cumberland, about half-way between Keswick and Ambleside. Height 3055 feet above the level of the sea. It is easy of ascent, and commands an extensive view of the lake district.

HELVETII, in *Ancient Geography*, a warlike and powerful Celtic tribe in Gaul, inhabiting the country now represented by the western portion of Switzerland. In the time of Cæsar, when they first became historically important, their country was bounded by the Rhine on the E. and N., by Mount Jura on the W., and by the Rhone and the Lake of Geneva on the S. It was divided into four *pagi* or cantons, containing in all, according to Cæsar, 12 towns and 400 villages. Of the names of these *pagi* only two are known, the *Tigurinus* and the *Verbigenus;* or, as it is sometimes, though less correctly written, *Urbigenus.* It is conjectured that the other two were held by the Tugeni and the Ambrones. The brief history of the Helvetii is known to all who have read the *Commentaries* of Cæsar. They aspired to make themselves the sovereign people of Gaul. Their own territory had become too small for their numbers, and was inferior in climate and fertility to the rest of the country, and they were exposed to incessant attacks from their restless neighbours of Germany. Such were probably the motives that induced them to leave their homes in a body and set out in quest of a happier clime, after burning their towns, villages, and personal property, all but the proportion of corn which it was decreed that each man should carry with him. The utter failure of their expedition, and the fearful slaughter with which it was accompanied, are described in the first book of the Gallic War by the great captain who alone, with a few legions, overthrew the vast host of the Helvetii. Of the 368,000 souls that left the Helvetian territory, only 110,000 returned to it. The survivors were compelled to rebuild all the towns and villages that had been burnt down; and as they had lost everything in the expedition, their neighbours, the Allobroges, received instructions from the conqueror to assist them with everything necessary for their support till they were once more able to support themselves. (The whole question of the Helvetian expedition is very fully discussed in Smith's *Dict. Geog.* by Mr George Long.)

HELVETIUS, CLAUDE-ADRIEN, a famous French *philosophe* of the last century, was born at Paris in 1715. He was educated at the Jesuit College of Louis-le-Grand in that city, and while there gave no sign of that talent which afterwards carried him on to such distinction. While his class-fellows were busy with their themes, he was assiduously developing the personal advantages he had received from nature. He was eminently handsome, was one of the best fencers and dancers of his day, and was so popular with the fair sex, that he had good reason to boast, as he often did, of his *bonnes fortunes.* After a short apprenticeship under his uncle M. D'Armancourt, *directeur des fermes* at Caen, he obtained, through the influence of the queen Marie Leczinska (whose physician his father had been), the office of fermier-general. With the vast fortune thus placed at his disposal he performed many acts of kindness, selecting chiefly as the objects of his generosity the struggling litterateurs of the day. He settled an annual pension of 3000 francs on Saurin, and a nearly equal sum on Marivaux. These and countless other acts of generosity he managed with that delicate tact which carefully avoided to humble or wound the self-respect of his protegés, whom he always succeeded in persuading that he was the obliged party. On one occasion Marivaux, in a hot dispute with his benefactor, lost his temper and became grossly abusive. When he left the room Helvetius merely remarked, "How I would have answered him, had he not laid me under an obligation by accepting my good offices." This extreme gentleness of heart showed itself afterwards on a greater scale. When he found that the faithful discharge of his duties involved an oppression of his countrymen similar to that at one time practised by the English towards their subjects in Eastern India, he resigned his highly lucrative appointment, after in vain attempting to reconcile himself to the work by the gentlest possible exercise of his authority. With his savings he pur-

Helvetius.

chased the office of *maître d'hôtel* to the queen; and as it did not necessitate a constant residence in Paris, he retired to the estate of Voré in La Perche which he had purchased. He took with him his newly-married wife, Mlle. de Ligneville, niece of the famous Madame Graffigny. In compliment to her he had reformed his dissolute habits of life, and directed into the field of literary enterprise his mind which still craved morbidly after distinction of any kind. So insatiable indeed was his appetite for applause, that he once danced on the stage of the opera, under the mask and name of the famous Javillier. His beautiful figure, graceful carriage, and exquisite dancing, prevented the trick from being discovered. A higher ambition, however, had seized him before he retired from Paris. He aspired to scientific and literary fame. He began with mathematics, which Maupertuis had made the fashion; and his ambition was fired to rival that philosopher, whom he had seen in the gardens of the Tuilleries surrounded by a circle of the most brilliant court beauties, and engrossing their attention despite his grotesque bearing and strange dress. Then he thought to rival Voltaire by philosophical epistles, a poem on *Happiness*, and a tragedy. The prodigious success of Montesquieu's *Esprit des Lois*, published in 1748, decided him to raise a monument which he hoped posterity would allow to stand beside that of his illustrious countryman. Immediately on his retiring into the country he began the composition of the work that was to divide the praises of future times with that of Montesquieu. Though he worked at it with the most conscientious assiduity, he yet found time to fulfil his duties at court (where he regularly spent four months of the year), and also towards his own tenantry, whose condition he did his best to improve, by administering justice among them, establishing manufactures, and teaching improved modes of agriculture. He was very jealous, however, of his seignorial rights, and was particularly severe in punishing infractions of the game-laws. The right of hunting he reserved strictly for himself and his friends. These duties and pleasures engrossed his spare time during the seven years he spent on the composition of his work. At last, in 1758, it was published anonymously under the title of *De l'Esprit*. The motto from Lucretius prefixed to the work, indicates its object better than any exposition :—

> ——— unde animi constet natura videndum,
> Qua fiant ratione, et qua vi quæque gerantur
> In terris.

The Encyclopedists and their partizans received the book warmly, and sounded its praises everywhere; but it was denounced at court by the priests as subversive alike of good government and sound morality. The first to express his dissatisfaction with the author and his work, was the dauphin (the son of Louis XV.), and Helvetius, terrified at the storm which he had raised, sought to allay the tempest by a series of recantations, each more humbly penitent than its predecessor. His apologies, however, were unavailing, especially as the priest party, then powerful at court, succeeded in persuading the court that the *De l'Esprit* was nothing other than a résumé of all the dangerous and immoral tenets of the Encyclopédie. The doctors of the Sorbonne took up the question, and formally condemned the work, which was forthwith burned publicly by the common hangman, along with some others of an equally obnoxious cast. The doctrines themselves which excited such general reprobation were merely those that had been brought into fashion by the Encyclopedists, expounded with the grossest literality. He posits as an axiom, that man is purely a creature of sensations; that these sensations when they impel to action, show themselves under different modes called passions; that pleasure or pain are the end and object of all human existence; and that consequently to seek the former and avoid the latter, is the only duty and object of man. As natural results of these postulates self-interest comes to be the sole principle of all our actions and judgments, and virtue and vice only another way of distinguishing the agreeable or disagreeable, the useful or hurtful qualities of things. The other parts of Helvetius's system are of a piece with those already stated. He maintained that as all men had received from nature the same physical constitution, they are naturally on a footing of equality in regard to their intellectual and moral powers; that the passions are the only mode of all development; and that to cultivate these passions is to educate the man. It were time thrown away here to refute a system so irremediably gross and grovelling, and which, after a brief career of fashion rather than of popular acceptance, passed away even before its author. It only remains to say, that as a literary performance, the *De l'Esprit* is well and consistently argued throughout. The arguments are enforced by numerous and often apt illustrations; while the style is viciously rhetorical. To escape the storm he had unwittingly raised, Helvetius passed over to England in 1764, and in the following year visited the Great Frederic of Prussia, who received him with every mark of honour and respect. After leaving the Prussian court Helvetius returned to his own country, where he died, Dec. 26, 1771. His posthumous work, *De l'Homme, de ses facultés intellectuelles et de son Education*, may be regarded as a sort of commentary on the work which first made him famous, though in a literary point of view it is infinitely superior. Many of the old theories, however, are rejected, others are greatly modified, and an attempt made to establish the principles on a better foundation.

Helvoetslius
‖
Hemans.

There are numerous editions of Helvetius' complete works, of which may be mentioned those of Liége, 1774; London, 1777; Paris, 1794, again in 1796, and a third time in 1818. They have also been translated into most of the languages of modern Europe.

HELVOETSLIUS, or HELLEVOETSLIUS, a strongly fortified seaport-town of Holland, province of South Holland, on the right bank of the River Flakkee or Haringvliet, the largest mouth of the Rhine, 16 miles S.W. of Rotterdam. It has an excellent harbour and large naval dockyard. Pop. about 2000. William III. embarked here for England 11th Nov. 1688.

HEMANS, MRS, one of the most pleasing of English poetesses, was born at Liverpool in 1793. Her maiden name was Felicia Dorothea Browne. Her father was a Liverpool merchant, who, meeting with some reverse in business, retired with his family into Wales, where his daughter imbibed that love of nature that glows in her works. Before she was fifteen she published a volume of poems, which had no great success, but the popularity gained by her second publication (a poetical volume on *The Domestic Affections* which appeared in 1812), encouraged her to persist in her literary career. In the same year she married Captain Hemans, but the union was not a happy one; and though it was never formally dissolved, yet when the Captain was obliged by bad health to seek a more genial clime in Italy, his wife remained at home to educate her children, and they never met again. In 1819 Mrs Hemans gained the prize of L.50 offered by a patriotic Scotsman for the best poem on the subject of Sir William Wallace. Her next considerable effort was a tragedy entitled *The Vespers of Palermo*, which, though produced on the London stage by John Kemble (he and Young taking the principal parts), was not successful. It is matter of much regret that she should have been obliged to waste her powers on occasional pieces which she produced in great numbers for the periodicals of the day. But the expenses of her children's education compelled her to exert herself in this way, and it may be doubted, even if she had had the leisure necessary for the production of a great work, whether her powers of mind were equal to such a task. The *Lays of Leisure Hours, National Lyrics, Songs of the Affections*, &c., under which titles her fugitive pieces were republished, all show that her genius was lyrical and reflective in its character, and hardly equal to any great narrative or dramatic effort. Her best pieces, it must be confessed, are those which, from their shortness, give no scope for the inflation and mannerism that disfigure most of her more ambitious efforts. These small poems exhibit much purity of sentiment, a fine vein of feeling, and a dangerous ease of versification. Her powers of description are very considerable; and as Lord Jeffrey remarked, "a lovely picture serves as a foreground to some deep or lofty emotion." It may be doubted if much of Mrs Heman's poetry will be read by posterity. Sir Walter Scott hinted that "there were too many flowers for the fruit;" and it is true that her works, though they fill the ear and the fancy, leave the heart and the intellect unsatisfied. Mrs Hemans' personal character was in all respects exemplary and amiable. After various changes of residence she settled in Dublin, where she died in 1835. There is a complete edition of her poems, with a biographical memoir by her sister, 6 vols. Edinburgh, 1839.

HEMATINE, the colouring principle of logwood. See Dyeing.

HEMEL-Hempstead, a market-town of England, county of Hertford, 24 miles N.W. of London. It stands on the acclivity of a hill rising from the small River Gade, and consists of one main street of considerable length. The parish church is a cruciform, and partly Norman structure, surmounted by a lofty octagonal spire. The town-hall is a long narrow building with an open market-place underneath. Market-day, Thursday. Straw-plaiting is extensively carried on. In the vicinity are several large paper mills. Pop. (1851) 2727.

HEMEROBAPTISTS, a sect amongst the ancient Jews, so called from their bathing every day, as a religious rite necessary to salvation. Epiphanius, who mentions this as the fourth heresy among the Jews, classes the hemerobaptists doctrinally with the Scribes and Pharisees, with this exception, that, like the Sadducees, they denied the resurrection of the dead.

HEMERODROMI, in *Grecian antiquity*, were, as the name imports, runners or couriers, who could keep running all day. In a country like Greece, where the roads were few and bad, the Hemerodromi were indispensable for the rapid diffusion of important news. Every Greek state made a point of training a number of these men who could travel great distances in an incredibly short space of time, and at every dangerous crisis were stationed on commanding points to observe and report at head-quarters what it was necessary for the authorities to know. Some interesting information concerning these couriers is given by Herodotus. He dwells at considerable length on the efficiency of those in the service of the Persian kings. The men were called *angoroi*, and the service *angereïon*. Instances are on record of the extraordinary swiftness of foot attained by the Hemerodromi. A little before the battle of Marathon, Phidippides, a professional courier, was sent to Sparta by the Athenian generals with the news of the impending fight, and arrived there on the second day after leaving Athens,—the distance between the two cities being nearly 150 miles. Pliny mentions that Anystis, a Lacedæmonian, and Philonides, a courier in the service of Alexander the Great, ran from Sicyon to Elis in one day—a distance of 1200 furlongs. Many other equally wonderful cases are on record in the classics. Among the Romans these couriers were known as *Cursores*; they travelled sometimes on foot, sometimes on horseback. Gibbon commends their swiftness and regularity. It is a well-known fact that running footmen attended the Duke of Marlborough in his wars in the Low Countries and in Germany. (See Courier.)

HEMI, a word employed in the composition of different terms. It signifies the same with *semi* or *demi*, viz., half; being an abbreviate of ἡμισυς, which signifies the same thing. The Greeks retrenched the last syllable of the word ἡμισυς in the composition of words; and, after their example, we have done so too in most of the compounds borrowed from them.

HEMINGFORD, Walter, or, as he is called by Leland, Hemingoburgus, one of the old Latin chroniclers of the fourteenth century, was a canon regular of the Austin Priory of Gisborough in Yorkshire. His chronicle relates the history of England from the time of the Norman Conquest till the twentieth year of Edward III. The first three books of this work (extending from the Conquest to 1273) were published by Gale in his *Scriptores Quinque*, and the remainder by Hearne, at Oxford, 2 vols. 1731. Hemingford died in 1347.

HEMLOCK, the *Conium maculatum* of botanists, is an umbelliferous plant possessing narcotic and powerful poisonous properties. It may readily be distinguished from most other umbelliferous plants by the numerous dark purple spots which cover its *smooth* stem and leaf stalks, and by the strong heavy odour, resembling that of mice, which it exhales. The poisonous properties reside in every part of the plant, and are owing to the presence of a peculiar volatile oleaginous alkaloid, called *conia* or *coneine*, capable of forming salts with acids, which are equally energetic as the conia itself.

It was long doubted whether this plant furnished the κωνειον or poison with which the ancient Greeks despatched their state prisoners, and which the death of Socrates has immortalized. This obscurity appears to have resulted from the circumstance that the symptoms observed in cases of reputed poisoning with the roots of this plant were different from those attributed to the ancient state poison—a difference now explained from other roots having been mistaken for it. Recent research has now, however, demonstrated that the action of this plant as a poison closely corresponds with the description given by Plato of the action of the state poison, so that no reasonable doubt now exists as to its identity. Hemlock is an energetic poison, especially in the form of its alkaloid conia, causing rapid death by inducing general paralysis of the muscles, and consequent stoppage of the breathing, without bringing on convulsive spasms or insensibility. In medicine hemlock has been much used in the form of poultices of the fresh leaves in cancerous affections, and seems to relieve the lancinating pain by its narcotic action. It is also applied externally in the form of poultices, extract, tincture, &c., to glandular tumours, scrofulous sores, &c.; and internally it has been administered in cancerous and strumous affections, enlargements of the liver, spleen, and glands, chronic catarrh, hooping-cough, neuralgia, hypertrophy of the heart and other affections attended with an excited state of the circulation. Its virtues, however, have not been sufficiently investigated. (J. S—K.)

HEMP, a tough fibre yielded by the large annual plant *Cannabis sativa*, of the natural order Cannabinaceæ. There are, however, several other fibres known in commerce to which the term is more or less commonly applied. For example—Juté hemp is obtained from *Corchorus capsularis* and *C. olitorius*; Manilla hemp from *Musa textilis*; Brown hemp from *Hibiscus canabinus*; Pité or Pita hemp from several species of agave and aloe; Sunn hemp, Madras hemp, brown Bombay hemp, and Malabar hemp, from *Crotalaria juncea*; Jubbulpore hemp, from *Crotalaria tenuifolia*, and several others.

The true hemp (*Cannabis sativa*) has been recognised as a useful plant from a very early period, although probably not of the same antiquity as flax. Herodotus is the first writer who mentions it (iv. 74), but he speaks of it in a manner which shows it must have been then well-known, for he describes the hempen garments made by the Thracians as being equal to linen (flax cloth) in fineness. Its use for making cordage is noted as early as 200 years B.C. by Moschion, who mentions that a large ship, the "Syracusia," built by Hiero II., was rigged with ropes made from hemp brought from the Rhone.

The original country of the hemp-plant is not positively known, but it is generally believed to have been the mountainous districts in the extreme north of India, whence it spread westward through Europe, and southward through the peninsula of India. Its cultivation in each direction had in all probability a different object; for it is found to produce under tropical culture an inferior fibre, and a powerfully intoxicating drug, but in cold and temperate climates it yields an abundance of strong fibres in great perfection for textile purposes, and loses its narcotic qualities. The similarity of its name in various languages is a strong indication that it has taken the course here indicated; thus, in the Sanscrit it is called *goni*, *sana*, or *shanapu;* Persic, *canna;* Arabic, *kanneh* or *kinnub;* Greek, *kannabis;* Latin, *cannabis;* Italian, *canapa;* French, *chanvre* or *chanbre;* Danish, *kamp* or *kennep;* Lettish and Lithuanian, *kannapes;* Slavonic, *konopi;* Erse, *canaib;* Scandinavian, *hampr;* Swedish, *hampa;* German, *hauf;* Anglo-Saxon, *haenep;* and English, *hemp.* In India other names are applied, indicative of its intoxicating or narcotic powers; thus, according to Dr Royle, it is called the "increaser of pleasure," the "exciter of desire," the "cementer of friendship," the "causer of the reeling gait," the "laughter mover," &c.; and he also suggests that it may have been the *nepenthes* ("assuager of grief") of Homer, given by Helen to Telemachus.

The intoxicating properties of hemp reside in a peculiar resinous extract naturally secreted by the plant when growing in a hot climate. So remarkable is this peculiarity, that botanists until lately insisted upon the hemp of India being a distinct species (*C. indica*). It is now, however, decided that there is really no specific difference, the change being simply climatal.

The secretion is deposited by exudation upon the surface of the leaves, the slender branches, and the flowers. According to Dr O'Shaughnessy, it is collected during the hot season by men clad in leathern dresses, who rush with violence through the hemp fields; the resin adheres to their dresses, from which it is scraped off and kneaded into lumps which have the appearance of pieces of linseed oil cake in colour and texture, and a peculiar and by no means agreeable smell. In this state it is called "churrus;" and there are evidently several varieties of the substance, as Dr Pereira describes it as being "in masses of the shape and size of a hen's egg, or of a small lemon, and formed by the adhesion of superimposed elongated pieces. It has a dull grayish-brown colour, and not much odour;" whereas one specimen in the writer's collection differs in being in large shapeless fragments of the colour of amber, with the loose friable texture of linseed cake, and a heavy unpleasant odour. Another specimen has a resinous lustre, a dark-brown colour, and is formed into an elongated oval shape, but not larger than half a hen's egg. This is almost odourless, and is probably the *momeea* or *waxen churrus*, said to be collected with great care by the hand, and to be highly prized. The dried plant, after it has flowered, and from which the churrus has not been removed, is compressed into bundles of twenty-four plants each, and is sold in the bazaars of India under the name of gunjah. The larger leaves and capsules, without the stalks, are also compressed into irregular sized masses, which receive the names of bang, subjee, or sidhee, in India. The háshish of the Arabians consists of the tops of the small branchlets after inflorescence, carefully gathered and dried. Both this and the two previously mentioned preparations are extensively used for smoking and chewing—the gunjah and bang in India and Persia, and the háshish in Africa. When the bushmen of Southern Africa were brought to England, they passed much of their time in smoking this narcotic in pipes made of the long teeth of alligators, hollowed out for the purpose. Its use as a means of intoxication is said to have given rise to our word assassin, from the fact that the low Saracen soldiery, called *hashashins*, when intoxicated with háshish, were sent into the camps of the crusaders for the purpose of killing whomsoever they met, the drug rendering them quite regardless of the consequences. The physiological effects of the various preparations above mentioned are most remarkable, and are unlike every other narcotic at present known. It produces inebriation and delirium of decidedly hilarious character, inducing violent laughter, jumping and dancing. The writer several times witnessed its effects upon the bushmen. After inhaling the smoke for some time they rose and began a very slow dance, which was gradually quickened until they became perfectly frenzied, and finally fell down in a state of complete insensibility, from which they were a considerable time in recovering. Dr O'Shaughnessy relates some most remarkable effects of the churrus, particularly its power in producing a state of true catalepsy. The same effects do not appear to take place upon Europeans, but this point has not yet been fairly tried, as the drug evidently suffers some change in its transmission by sea.

But it is not as a narcotic and excitant that the hemp plant is most useful to mankind; it is as an advancer rather than a retarder of civilization, that its utility is made most manifest. Its great value as a textile material, particularly for cordage and canvas, has made it eminently useful; and if we were to copy the figurative style of the Sanscrit writers, we might with justice call it the "accelerator of commerce," and the "spreader of wealth and intellect." For ages man has been dependent upon hempen cordage and hempen sails for enabling his ships to cross the seas; and in this respect it still occupies a most important place in our commercial affairs.

For its valuable fibre hemp is very largely cultivated in Europe, but chiefly in Russia and Russian Poland. It undergoes the same process for decomposing the parts of the stem as that described in the article on FLAX, called *water-retting*, by which the cellular tissue of the bark and medulla is destroyed, and the long fibres of the woody part are set free. This is not done by simply soaking in the waters of ponds and streams, for it requires to be dried both previously and subsequently to the retting process; after which it is beaten with wooden beetles or mallets, or by an apparatus called a *break* or *brake* worked by a treddle. Sometimes, however, this laborious operation is effected by water or steam-power. Some of the finer kinds of hemp are more carefully prepared; the seed is sown broad-cast instead of in drills, by which the stems are grown more slender and the fibres finer; and after the water-retting each stem is taken in the hand, and the epidermis is stripped or *peeled* off, and the reed or boon is then submitted as before mentioned to the *breaking* process. In both cases after *breaking* the stalks are conveyed to the *scutching-mills*, where the separation of the fibres is still further effected by rubbing and striking, after which it is heckled or hackled—the heckler taking as much as he can conveniently hold and drawing it through a number of iron spikes fixed in a board forming a kind of comb.

The process called dew-retting, described in the article on FLAX, is also adopted for very fine varieties of hemp, such as the white crown Marienburg, and the Italian garden hemp; and in Russia and Sweden another method called snow-retting is used. After the first fall of snow the hemp which has been put up in stacks is spread out over the snow, and left to be buried by successive falls. It thus remains covered until the snow disappears, and is then sufficiently retted.

We have hitherto received the largest quantity of hemp from Russia—St Petersburg, Memel, and Riga being the chief ports of shipment; but the late war, which put a stop to the supply from this source, is likely to produce a beneficial result to our colonies. The indefatigable exertions of Dr Royle on behalf of the Indian government have led to the knowledge of various fibrous substances which are produced in the greatest abundance in our Indian empire, several of which are rapidly taking the place of hemp both in the manufacture of cordage and canvas; so that having been forced into a knowledge of our own resources, it is not probable we shall ever be so dependent upon Russia in future for this necessary article.

The best substitute appears to be the Caloee or Rheea fibre produced by a plant of the nettle tribe (Urticaceæ), *Boehmeria nivea*. The Rheea fibre can, it is expected, be produced very much cheaper than Russian hemp, and it is nearly twice as strong. Hitherto hemp has had one great advantage over all other fibres in the manufacture of cordage, and it remains to be seen whether the Rheea fibre has this qualification. When a hempen rope is worn out, if it has not been tarred, it is valuable for making paper; and if it has been tarred, it is even more useful for oakum. This is not the case certainly with the fine ropes of Manilla hemp (*Musa textilis*), which, though stronger than the best Russian hemp, are almost useless when worn out. The same may be said of the admirable coir ropes now so extensively used for ship's hawsers and other cordage exposed to water. These ropes are made of the fibres from the husk of the common cocoa-nut.

The fibre called New Zealand flax, which is procured from the long sword-shaped leaves of *Phormium tenax*, a liliaceous plant, has been much recommended of late; but whether from the difficulty of preparing it, or from the inadequacy of the supply, it has not yet become a regular article of commerce. The epidermis of its leaves is more compact and harder than that of the stalks of the plants previously mentioned, and this may cause great difficulty both in retting and scutching.

We import hemp from Russia, Italy, Holland, Turkey, the East Indies, and latterly from the United States. That from America, however, is of inferior quality and blackish colour. The East Indian hemp is coarse, and is in small hanks plaited about the thickness of a man's arm. The Italian hemp is very fine, that variety called garden-hemp being the longest of any kind; its superiority is supposed to be the result of spade culture in very suitable soil. It is also as white and soft as the finest white Russian.

Of the Russian kinds the St Petersburg clean and the Riga rein (or clean) are the best for general purposes. The variety called white crown Marienburg is remarkably short, white and soft; it is only fit for fine canvas.

The quantity of hemp imported into the United Kingdom was—

	From Russia.		From other countries.
In 1851.........	33,229 tons	In 1851.........	31,441 tons
... 1852.........	26,857 ...	... 1852.........	26,551 ...
... 1853.........	40,320 ...	... 1853.........	20,619 ...
... 1854.........	1,044 ...	... 1854.........	35,927 ...
... 1855.........	nil. ...	... 1855.........	28,010 ...

The price of Russian hemp has ranged from £38 to £90 per ton during the last five years, the maximum price being caused by the war. Considerable quantities are also raised in England and Ireland.

Of the figures just given those relating to Russia may be depended upon, but those referring to the imports from other countries are by no means satisfactory; for owing to the slovenly manner in which our commercial statistics are collected by the government, all articles which bear the trade name of hemp are included, such as Manilla hemp, and very often even juté.

There is one other useful quality in the hemp plant; it produces an abundance of seed, which not only yields a valuable oil, but the seed is extensively used in feeding singing birds. As the hemp is *diœcious*, only about one half the plants produce seeds; but these yield it in such abundance that an acre will yield from three to four quarters at about 40s. per quarter. As this is independent of the fibre produced it is a profitable crop in countries like Russia where the land is not too valuable.

For fuller information upon the subject consult Dr Royle's *Illustrations of the Botany of the Himalayan Mountains*, and his *Fibrous Plants of India;* Dr O'Shaughnessy on the *Preparation of the Indian Hemp or Gunjah;* and the erudite work *Textrinum Antiquorum*, by James Yates, Esq., M.A. (T. C. A.)

HEMS or HOMS, the ancient *Emesa* or *Emissa*, a city of Syria, 90 miles due N. of Damascus. It stands on the N.E. shore of a small lake formed by the River Orontes, which affords abundant supplies of water for the irrigation of the neighbouring districts. Besides a considerable trade, Hems possesses woollen, cotton, and silk manufactures; and its gold and silver thread are in high repute. The mosques, churches, and bazaars, are numerous and handsome. In ancient times Hems was celebrated for its splendid temple of the sun. One of the priests of this temple was, at the early age of fourteen, made emperor of Rome, under the name of Heliogabalus. It was in the vicinity of this town that Zenobia, the renowned queen of Palmyra, was defeated by the emperor Aurelian, A.D. 272.

HÉNAULT, CHARLES-JEAN-FRANÇOIS, author of the *Abrégé Chronologique de l'Histoire de France*, and president of the parliament of Paris, was born in that city in 1685, and died there in 1770. His father was one of the fermiers-généraux, and he himself, partly from his inherited wealth, partly from his position in the queen's household, of which he was controller-general, and partly from his personal qualities, was received into the best society of the French capital. He was in early life gay, witty, graceful in his manners, a good musician, and a neat song-writer. He had all, in short, that could make him (what was then the chief ambition of most Frenchmen to become) a man *a-la-mode*. In literature he attained such considerable distinction by his comedies and fugitive poems, that in 1723 he was received into the French Academy, and afterwards into the leading literary societies of Europe. After his fiftieth year he retired into private life, and devoted the remainder of his days to study and religious exercises. But as the Marquis d'Argenson remarks, "his devotion was as free of fanaticism as his writings of pedantry." His friendship for Voltaire remained undiminished till the close of his life; and it was a kindly motive that impelled him at the age of eighty to write seriously to that arch-scoffer, praying him to desist from his ceaseless pasquinades against Christianity. Henault will be remembered chiefly for his *Abrégé Chronologique*, first published in 1744, without the author's name. Between that date and 1756, there appeared numerous editions of it; but it was not till the latter year that Henault proclaimed himself as the author of the book. The *Abrégé* is a perfect model of its kind, and though it has now fallen somewhat into disuse, yet that result is rather a reaction against the excessive praise that was at first lavished on it, than a proof that it has been superseded. In the compass of two volumes, Henault has comprised the whole history of France from the earliest times to the death of Louis XIV. His information is, for the most part, drawn from original sources. The results of deep researches and lengthened disquisitions on public law are summed up in a few words. Controverted points of history, on which volumes have been written, are cleared up sometimes in a single sentence.

The moral and political reflections are always short, and generally as fresh and pleasing as they are just. A few masterly strokes reproduce the leading features of each age, and the characters of its illustrious men. Accurate chronological tables set forth the most interesting events in the history of each sovereign, such as his birth, accession, marriage, death, &c., and the names of the great men that flourished during his reign. Interspersed throughout the work are occasional chapters on the social and civil state of the country at the close of each era in its history.

Hénault's other works are his *Histoire Critique de l'établissement des Français, dans les Gaules, ouvrage inédit du Président Hénault, imprimé sur le Manuscrit original écrit de sa Main*, Paris, 1801, in 2 vols. 8vo; *Lettre du Président Hénault sur la Régale, addressée à l'Abbé Velly*, originally published in the *Mercure de France; Lettres du Président Hénault à Marmontel, au sujet d'un Extrait de l'Abrégé de l'Histoire de De Thou*, in the collection of Fontanieu; *Mémoire sur les Abrégés Chronologiques* (*Mém. de l'Acad. des Inscrip.*); *Discours qui a remporté le prix d'éloquence de d'Académie Française*, 1701, *par Hénault, Conseiller au Parlement*, Paris, 1707, in 4to; *Pièces de Théâtre, en Vers et en Prose*, a collection which contains *Cornélie Vestale, Françoise II.*, the *Petite Maison*, the *Jaloux de Lui-même*, the *Réveil d'Epiménide*, and the *Temple des Chimères*.

HENBANE (*Hyoscyamus niger*), a narcotic plant of the nat. ord. Atropaceæ, the Deadly Nightshade order. The juice has the property of causing the dilatation of the pupil of the eye; and it has long been used in medicine as a sedative and narcotic. It is said that swine can browse with impunity on this very poisonous plant. See Botany.

HENERY Isle, a small island lying due S. from Bombay. It is about 600 yards in circumference, and nearly of a circular form. It is fortified and well inhabited. In 1790 it belonged to Ragojee Angria, and was a principal rendezvous of private vessels, though within sight of Bombay. Near it is another small island named Kenery, which is also fortified, and of considerable strength. It was taken possession of and fortified by Sevajee in 1679. In 1790 it belonged to the Peshwa, and was also the haunt of pirates. Henery is situated in E. Long. 72. 50., and N. Lat. 18. 42.

HENGIST, the brother of Horsa, was the first Saxon chief who established himself in England. He reduced the south-eastern corner of the kingdom, and ruled over Kent under the title of king. He fixed his residence at Canterbury, where he died in A.D. 488. (See England.)

HENG-KIANG or Siang, a river of China, rising in the mountains, which separate the province of Honan from that of Kwang-tung, and falling into the lake of Tung-ting, after a northward course of about 300 miles.

HENG-TCHOU, a city of China, capital of a cognominal department in the province of Honan, on the Heng-Kiang River. N. Lat. 26. 55., E. Long. 112. 23. Paper is extensively manufactured here.

HENLEY-IN-ARDEN, a market-town in the W. of Warwickshire, on the Alne, 8 miles W. from Warwick, and 102 miles from London. It contains a church of the time of Edward III., remarkable for its beautiful interior, and the remains of an old market-cross. Nails, needles, and fish-hooks are made here. Market-day, Monday. Pop. (1851) 1143.

Henley-on-Thames, a municipal borough and market-town of England, Oxfordshire, on the left bank of the Thames, 22 miles S.E. from Oxford, and 35 from London. It is pleasantly situated at the foot of the Chiltern Hills. The principal streets, four in number, are well lighted and paved. The Thames is here crossed by an elegant stone bridge of five arches. The church is a handsome Gothic structure, with a lofty tower, and is supposed to have been built by Cardinal Wolsey. It has an endowed grammar-school, founded in 1605; united charity and other schools; reading-room, library, and a number of charitable institutions. The town-hall is a neat building, supported by Doric columns; the under part is used as a market-house. Market-day, Thursday. Henley carries on considerable trade in corn, flour, malt, and timber. It is governed by a mayor, a high steward, 10 aldermen, and 16 burgesses. Pop. (1851) 2595.

HENNA, the name of a yellow pigment obtained from *Lawsonia inermis*, a plant of the nat. ord. Lythraceæ. It is much used in Egypt, Arabia, Persia, and throughout the East generally, for staining the nails of the fingers, the manes and hoofs of horses, &c.; and some have attributed the yellow tinge of the nails of the Egyptian mummies to the use of this dye, though probably without sufficient reason.

HENNERSDORF or Seifhennersdorf, a large manufacturing village in Saxony, on the Bohemian frontier circle, 20 miles S.S.E. of Bautzen. Pop. 5600, who are engaged in the manufacture of linen and nankeen, as well as in bleaching. Hennersdorf is the name of numerous small villages in Germany.

HENOTICUM, an edict of the Emperor Zeno, published A.D. 482, and intended to reunite the Eutychians with the Catholics. It was procured from the emperor by Acacius, patriarch of Constantinople; and was in the form of a letter, addressed by Zeno to the clergy and people of Egypt and Libya. As it contained a favourable mention of the council of Chalcedon, it was supposed to favour the Eutychian party; and after much opposition, was at length formally condemned by Pope Felix II.

HENRY, the name of a succession of sovereigns in England, France, and Germany. The English kings of this name are:—Henry I., surnamed Beauclerc, third son of William the Conqueror. He succeeded his brother, William Rufus, and reigned from 1100 to 1135. Henry II., son of Geoffrey Plantagenet, Earl of Anjou, and Matilda, daughter of Henry I. He succeeded Stephen, and reigned from 1153 till 1189. Henry III., son of King John, reigned from 1216 till 1272. Henry IV. usurped the throne in 1399, died in 1413. Henry V., his son, succeeded him in 1413, and died in 1422. Henry VI. was crowned in 1422, when only ten months old, and was killed in the Tower in 1471. Henry VII., founder of the Tudor dynasty, came to the throne in 1485, and reigned till 1509. Henry VIII. reigned from 1509 till 1547.

Four kings of the name of Henry or Henri have reigned in France. Henri I., son of Robert, and grandson of Hugues Capet, reigned from 1031 till 1060. Henri II. succeeded his father, Francis I., in 1547, and was accidentally killed at a tourney in 1559. Henri III., the third son of Henri II. and Catherine de Medici', succeeded his brother, Charles IX., as king of France in 1574, and was assassinated in 1589. Henry IV., called Henry the Great and Henry of Navarre, was virtually king of France from 1589 till his assassination in 1610.

The German emperors of the name of Heinrich or Henry are seven, viz.,—Henry I., 919–936; Henry II., 1002–1024; Henry III., 1039–1056; Henry IV., 1056–1105; Henry V., 1111–1125; Henry VI., 1190–1197; Henry VII., 1308–1313.

The histories of these sovereigns are given in full under the special heads of England, France, and Germany.

Henry *of Huntingdon*, an ancient English chronicler, was born about the end of the eleventh century, and was brought up by Alcuinus of Anjou, a canon of Lincoln Cathedral. After taking orders he was made archdeacon of Huntingdon. The date of his death is not known. His *History of England*, in eight books, extends from the invasion of Julius Cæsar to the accession of Henry II. (A.D. 1154.) It has been nowhere printed except in Savile's *Scriptores post Bedam*, Lond. 1596. In so far as it is a contemporary history, Huntingdon's work possesses little or no value, but in an antiquarian point of view it is one of the most valuable heir-looms transmitted to us by the twelfth century. It is interspersed with a good deal of verse, partly original and partly copied. The author himself states that, taking Bede as his model, he added much from other sources, and borrowed from the chronicles which he found in ancient libraries. In vol. ii. of Wharton's *Anglia Sacra* is a long letter from Huntingdon to a friend, full of interesting anecdotes of the kings, prelates, and other notable personages of his day.

Henry, *Matthew*, the author of the celebrated *Exposition of the Old and New Testaments*, was born in 1662 at Broad Oak, a farm-house near Iscoyd, in Flintshire. He was the son of Philip Henry, one of the 2000 ministers who were ejected from their livings in 1662 for refusing to conform to the *Act of Uniformity*. Unlike the majority of his fellow-sufferers, Philip Henry was spared all personal privation or hardship as the consequence of his non-conformity by the accident of private means which he had received with his wife. He was thus enabled to give a good education to his son Matthew, who, after making considerable progress in the study of law at Gray's Inn, abandoned that profession, and took orders as a dissenting minister. In 1687 he was appointed to a charge at Chester, where he remained till 1712, in which year he was translated to Hackney. Two years later (June 22, 1714), he died suddenly of apoplexy at Nantwich while on a journey from Chester to London.

Matthew Henry's *Exposition*, the work by which he is now remembered, is a commentary of a practical and devotional rather than of a critical kind, ranging over the whole of the Old Testament, and extending into the New as far as Romans. At this point it was broken off by the author's death, but the work was finished by a number of clergymen, whose names are recorded in most editions of the book. In a critical point of view, the *Exposition* is quite valueless; yet its freshness, variety of thought, its high moral tone, and its well-sustained flow of good writing, have secured it the foremost place among the works of its class. There are few better things in English literature than the comments on the parable of the prodigal son. That, however, must be acknowledged the finest passage in the whole work. Besides the *Exposition*, Matthew Henry wrote a *Life of Mr Philip Henry; Directions for Daily Communion with God; A Method for Prayer; A Scriptural Catechism*, and several other works.

There are two *Lives of Matthew Henry;* the first by W. Tong, 8vo, 1716, and the second (a much better one) by Mr. Williams, prefixed to his edition of the *Exposition*, 3 vols., Lond. 1828.

Henry, *Robert, D.D.*, the author of the *History of Great Britain, written on a new plan*, was born in 1718 at a farm-house in the parish of St Ninian's, near Stirling. He was educated first at the school of his native parish, afterwards at the grammar-school of Stirling, and finally at the University of Edinburgh. Beginning public life as master of the grammar-school of Annan, he afterwards (in 1746) took orders and became the minister of a Presbyterian congregation at Carlisle. In 1760 he removed to a similar charge at Berwick-upon-Tweed, where he married a Miss Balderston, daughter of a surgeon in the town. It was during his stay at Berwick (where he signalized himself by his public spirit and zeal in promoting the local charitable schemes) that the idea of his *History* first occurred to him. But the dearth of books and the other difficulties of a provincial situation compelled him to postpone the execution of his design, till, through the influence of his wife's relations, he was translated to Edinburgh as minister of the New Greyfriars. He was then encouraged by the abundance of resources opened to him in the public libraries, and the ease with which he had access to them, to proceed with his great design. The first volume of the *History* appeared in 1771, and the others followed at irregular intervals till 1785, in which year the fifth was published, bringing down the narrative to the accession of the Tudor dynasty. The historian, who had been made a D.D. by the University of Edinburgh, died in 1790, before his sixth volume was quite ready for the press. Four years after his death it was published under the care of Malcolm Laing who supplied the missing chapters, and performed the editorial work with great accuracy and ability.

Henry's *History* was undoubtedly a great advance upon all the works of the kind that had been attempted in England before his day. His design, which, up to the measure of his knowledge and ability, he carried out with decided success, was to engraft upon the narrative of the great political events of each era an account of the domestic state and social progress of the people within the same period. Despite the care with which Henry conducted his researches, his work is now superseded. The true sources of history were at that time hardly open to the writer, and Henry was consequently obliged often to adopt authorities even then doubtful and now wholly exploded. Nor are his faults redeemed by the qualities that still make Hume's the standard *History of England.* He does not conceive or draw the characters of the great personages that figure in his *History* with any depth of insight or skill in delineation. He is likewise totally wanting in that philosophic power which enabled his illustrious contemporary to take the wide and generalized views of history that distinguish his work. These faults of Henry's were even in his own day pointed out by his arch enemy, Gilbert Stuart, with a ferocious malignity worthy of the worst frenzy of John Dennis. There is a large substratum of truth in Stuart's criticisms, yet they breathe so completely the spirit of a literary cut-throat, as their author undoubtedly was, that our moral sympathies go entirely with the victimized historian. Stuart made no secret of his resolution to ruin the sale of Henry's work, and by his ruthless reviews of it in various influential journals he gained his point—at least for a time. But it was only for a time, for Henry realized altogether from his work L.3300, and in 1781, through the influence of Lord Mansfield, was rewarded for his labours with a pension of L.100 a year by George III. (The details of Henry's life are to be found in a biographical sketch prefixed to the posthumous volume of his *History.* An account of his quarrel with Gilbert Stuart is given in Isaac D'Israeli's *Calamities of Authors*, vol ii., p. 63.)

Henry, *William*, a distinguished chemical philosopher, was born at Manchester, December 12, 1774. He was the son of Mr Thomas Henry, a zealous cultivator of chemical science. In early life an accident disqualified him for the sports of boyhood, and thus early developed a taste for study which was fostered by his first teacher, the Rev. Ralph Harrison, one of the best instructors of youth at that time in the north of England. On leaving Mr Harrison's academy, Henry became private secretary to Dr Percival, a physician of great general accomplishments and refined taste, who directed his course of reading with equal kindness and judgment. For five years he remained in the house of this valuable friend, and after some preliminary medical study in the infirmary of Manchester, removed, in 1795–6, to the University of Edinburgh, where some of the greatest masters of moral and physical science were then teaching. So powerful was the stimulus there given to his mental powers, that he often said, the rest of his life, active as it was, appeared a state of inglorious repose when contrasted with this season of unremitted effort. Prudential considerations obliged him to leave Edinburgh at the end of a year; but in 1805 he once more resumed his studies there, and two years later received his diploma of M.D. The interval between the two periods of his residence at Edinburgh was spent partly in the duties of medical practice at Manchester, and partly in superintending a chemical work commenced by his father, which gave him great facilities for prosecuting original researches in his favourite science. In 1797 he sent to the Royal Society of London the first of a long series of scientific memoirs, with which he enriched the *Transactions* of that body. Its object was to re-establish the title of carbon to be ranked among elementary bodies, which had been denied by Austin, Beddoes, and other eminent chemists. He afterwards discovered a fallacy in his own reasoning, which he detected and exposed, in a subsequent memoir, before it was noticed by any other chemist. In 1800 he published in the *Philosophical Transactions* his experiments on muriatic acid gas. Previous to the discoveries of Davy oxygen was regarded as the sole principle of acidity; and muriatic acid was consequently believed to be composed of oxygen associated with an unknown radical. Henry's experiments had been made with the view of disengaging this imaginary element. When Davy's theory was propounded, many years after this date, Henry was one of the earliest converts. In 1803 he published his elaborate experiments on the quantity of gases absorbed by water at different temperatures, and under different pressures. The result of these was the establishment of the law that "water takes up of gas, condensed by one, two, or more additional atmospheres, a quantity which would be equal to twice, thrice, &c., the volume absorbed under the common pressure of the atmosphere." In 1808 (the year in which he became a Fellow of the Royal Society) Henry described in the *Philosophical Transactions* a form of apparatus adapted to the combustion of larger quantities of gases than could be fired in eudiometric tubes. This apparatus, though now superseded, gave more accurate results than had ever before been attained. In the following year, 1809, the Copley gold medal was awarded to him for his valuable contributions to the *Transactions* of the Royal Society. For the next fifteen years he continued his experiments on the gases, making known the results of them from time to time to the Society. In his last communication, in 1824, he claimed the merit of having conquered the only difficulty that remained in a series of experiments on the gaseous substances issuing from the destructive distillation of coal and oil, and proved the exact composition of the fire-damp of mines. Availing himself of the property (recently discovered by Döbereiner) in finely-divided platinum, of causing gaseous combinations, he proved the exact proportions which the residues, after the action of chlorine on oil and coal gases, bear to each other.

All the experiments of Dr Henry to which we have hitherto alluded bore upon aëriform bodies; but though these were his favourite subjects of study, his acquaintance with general chemistry is proved by his *Elements of Experimental Chemistry* to have been both sound and extensive. This work was one of the first on chemical science published in this country, which combined great literary elegance with the highest standard of scientific accuracy. His comparative analyses of many varieties of British and foreign salts were models of accurate analysis, and were important in dispelling the prejudices then popular in favour of the latter for economical purposes. His memoir on the theories of galvanic decomposition earned the cordial approval of Berzelius, as being among the first to maintain that view to which he himself pinned his faith.

It is to be regretted that Dr Henry did not contribute more to the literature of science. His biographical notices of his great contemporaries, Priestley, Wollaston, and Davy, have been justly pronounced as among the best examples of that kind of composition in the English language. His contrast between Davy and Wollaston may recall Playfair's celebrated contrast between Black and Hutton, both in the qualities common to the minds compared, and in the vigour which marks both compositions. Especially is it to be regretted that he did not live to carry out the great literary project for which he had collected materials—a history of chemical discovery from the middle of the last century. He could have made it one of the most popular books of science in our tongue. His son and biographer claims a very high degree of merit for his literary compositions, and particularly for his familiar letters. The concurrent testimony of all authorities proves that the general estimate of Dr Henry appended by his son, Dr Wm. Charles Henry, to his *Biographical Account of the late Dr Henry*, is by no means partial or overdrawn. "In the general intercourse of society Dr Henry was distinguished by a polished courtesy, by an intuitive propriety, and by a considerate forethought, and respect for the feelings and opinions of others; qualities arising out of the same high-toned sensibility that guided his tastes in letters, and that softened and elevated his whole moral frame and bearing. His comprehensive range of thought and knowledge, his proneness to general speculation in contradistinction to detail, his ready command of the refinements of language, and the liveliness of his feelings and imagination, rendered him a most instructive and engaging companion. To the young, and more especially to such as gave evidence of a taste for liberal studies, his manner was peculiarly kind and encouraging."

At intervals during his whole life Dr Henry suffered severely from the effects of the accident already mentioned which befell him in early life. This produced paroxysms of intense neuralgic agony, which rendered the extirpation of the principal nerves of the hand necessary: but this failed to afford the expected relief; and latterly, the irritation of the whole nervous system deprived him of sleep, and caused his death on September 2, 1836.

HENRYSON, Robert, one of the best of the old Scottish poets, flourished in the latter half of the fifteenth century. Very little is known of his personal history. He is described as having been the chief schoolmaster of Dunfermline. In one of his works he alludes to himself as "ane man of age;" and from Sir Francis Kynaston we learn that, "being very old, he dyed of a diarrhea or fluxe." As to the time of his death it is certain that he predeceased Dunbar, who, in his *Lament*, printed in 1508, says—

> "In Dunfermling he has taen Broun
> With good Mr Robert Henrysoun;"

but the exact date of his death is unknown.

The best of Henryson's pieces is the beautiful pastoral of *Robene and Makyne*, the earliest specimen of that kind of composition in Scottish literature, and one of the best pastorals in any language. The conduct of the story is as skilful as the diction is terse and elegant. It was first printed in Ramsay's *Evergreen*, Edinb., 1724, but became much more widely known when reprinted by Percy in his *Reliques*. Besides this pastoral, Henryson wrote a supplement to Chaucer's *Troilus and Cresseide;* which in the editions of Chaucer, is generally appended to that poem, under the title of *The Testament of Fair Cresseide*. This poem is so beautiful in many of its parts, and displays such richness of fancy, and such touching earnestness of pathos that we must ever regret the poet's unfortunate choice of a theme. His largest work, however, is a collection of fables, thirteen in number, of which the best is undoubtedly the tale of the *Vponlands Mouse and the Burgesse Mouse*. Most of the subjects of these fables are drawn from Æsop, but not all. Among the Harleian MSS. in the British Museum are preserved the *Morall Faibillis of Esope*, compylit be Maister Robert Henrisoun, Scolmaister of Dunfermling, 1571. A few years later appeared the *Fabulous Tales of Esope, the Phrygian*, compiled moste elegantly in Scottishe meter by Mr Robert Henrison, and now lately Englished: London, printed by Richard Smith, 1577. A reprint of Henryson's *Fables* was made in 1832 for the Maitland Club of Edinburgh, from the edition of Andrew Hart, of which the only copy known to exist is preserved in the Advocates' Library of that city. The disputed tale of *Orpheus and Eurydice* is attributed to Henryson by Dr Irving and Mr Laing, though it is decidedly inferior to nearly all his other works.

HEPHÆSTÆA. See Lampadephoria.

HEPHÆSTION, a grammarian of Alexandria who flourished about the middle of the second century. He is believed to have been one of the preceptors of the emperor Ælius Verus; at least he is generally identified with the Hephæstion described as holding that office by Julius Capitolinus in his Life of Verus. From Suidas we learn that he was a very voluminous writer; but of all his works none have descended to us except a treatise on the Greek Metres ('Εγχειρίδιον περὶ Μέτρων). This work, though neither complete nor perfectly reliable, is important as forming the basis of our knowledge on the subject. It was first printed at Florence in 1526; again, by Turnebus at Paris, with Scholia, in 1553; and a third time by Hudson, with the *Prolegomena*, attributed to Longinus, Oxford, 1710. Later editions are those of Pauw, Utrecht, 1726; and Gaisford, Oxford, 1810, with the *Chrestomathia* of Proclus. This edition was reprinted at Leipzig in 1832.

HEPHÆSTUS. See Vulcan.

HEPPENHEIM, a walled tower in Hesse-Darmstadt, and capital of the province of Starkenburg, 16 miles S. of Darmstadt. It contains a church built by Charlemagne. On an eminence behind the town, and upwards of 1000 feet high, stand the ruins of the castle of Starkenburg, which has given name to the province. Pop. 4200.

HEPTAGON, a seven-sided figure. See Geometry.

HEPTARCHY, a general term for the seven petty independent kingdoms into which England was parcelled out by its early Anglian and Saxon conquerors. These were Kent, Sussex, Wessex, Essex, Northumbria, East Anglia, and Mercia. See England.

HERA. See Juno.

HERACLEA, in *Ancient Geography*, a large and important city of Magna Græcia. It was situated in Lucania, between the small streams Siris and Aciris, a little way inland from the shore of the Tarentine Gulf. Its early history is obscure, but it seems to have been colonized from Thurii and Tarentum, B.C. 432. It soon attained to great prosperity, especially after having been fixed upon as the seat of the general assembly of the Greek cities in Italy. In the wars with Pyrrhus it sided with Tarentum against Rome; but it afterwards abandoned its parent state, and became an ally of the Roman people. It suffered severely during the social war, but still retained a considerable measure of importance and prosperity. When, or from what causes, it fell into decay is unknown; but nothing remains to mark its former greatness, or even its site, but mounds of stones and the upturned foundations of old buildings. Antiquities of great value are occasionally found among the ruins. Of these the most important are the *Tabulæ Heracleenses*, two bronze tables on which is inscribed the Lex Municipalis of Julius Cæsar, and which constitutes our chief authority on the subject of the municipal law of Rome. This inscription has been published by Muratori, Haubold, and Mazocchi, and largely illustrated by Savigny in his miscellaneous works. Heraclea is said to have been the birthplace of the famous Zeuxis; but whether that be true or not, it is known that the arts found in the city a congenial home.

Heraclea, surnamed *Minoa*, in *Ancient Geography*, a Greek city of Sicily, at the mouth of the Halycus (now the *Platani*), 20 miles N.W. from Agrigentum. The surname seems to have been originally the name of the town, which is first mentioned in history as a colony of Selinus. About the end of the sixth century B.C. it was recolonized by the Spartans, and had attained to great prosperity and power, when it was destroyed by the jealousy of the Carthaginians. After remaining in their power for about 200 years, it fell into the hands of Agathocles, and then of Pyrrhus. It was next recovered by the Carthaginians, who retained it till at the end of the first Punic War the whole of Sicily was made over to the Romans. In the second Punic War it reverted to the Carthaginian sway, but was finally attached to the Roman empire by Marcellus shortly after the fall of Syracuse. After the servile war, Heraclea was repeopled by the Romans, and continued to flourish till the time of Cicero, who alludes to it as a place of importance. Before the age of Ptolemy it seems to have sunk into decay, and at this day its very ruins can hardly be traced.

Heraclea Pontica, now *Erekli*, a Greek city of Bithynia, on the S. shore of the Euxine Sea, about 130 miles from Byzantium. It was a joint colony of Megara and the Bœotian Tanagra; but the date of its foundation is unknown. From its position and its excellent harbours, it soon attained to great prosperity and power, and reduced under its sway the Mariandyni and the other tribes lying between the Parthenius and the Sangarius, a distance of nearly 120 miles. Its decline began with the quarrels between the people and the aristocracy, in the course of which a private citizen, by name Clearchus, usurped the power about B.C. 380. Under him and his immediate successors, the city still continued to flourish, but a combination of the Bithynian princes, jealous of its prosperity, stripped it of its territory. Its ruin was completed by the Romans in the Mithridatic War. Aurelius Cotta took the town, and its splendid library, baths, and temples, were burned to the ground. Under the emperors, however, the town revived, and is described as a flourishing port so late as the reign of Manuel Comnenus. The modern town of Erekli rises in the form of a sort of amphitheatre from the sea, and presents many traces of its past magnificence. Its walls, in many places of great height and thickness, are crumbling into ruins, as its castle has already done. The harbour, though neglected, is still a good one, and some ship-building is carried on. Erekli exports in considerable quantities timber, silk, and wax; and has, besides, a large import trade.

HERACLEONITES, a sect of Gnostics in the second century, were the followers of Heracleon, a pupil of Valentin. They held the existence of a good and evil principle, coexisting now, but not alike eternal, and ascribed to man an heavenly, in addition to his reasonable soul. The anointing of the dying according to certain formularies, and prayers addressed to the Demiurgus, was by them termed salvation.

HERACLIDÆ, the descendants of Hercules. In a general sense, the term is applied to all the families of Greece that traced their origin to the great mythic hero of their country. In a more limited sense it is restricted to those descendants of Hercules, who, along with the Dorians, conquered the Peloponnese. They were, in fact, the Normans of Grecian history. The story goes, that after the death of Hercules (who had been deprived of his lawful rights by Eurystheus through the craft of Juno), his children were obliged to take refuge for their lives in Attica. They were there welcomed by Theseus, who furnished them with the means for taking the field against the usurper Eurystheus. With the aid of the Athenians, they defeated and slew the tyrant, and settling quietly in their ancient homes, effected what is known in Greek history as the "return of the Heraclidæ." At the end of the first year of their return, however, they were once more driven out by a pestilence. Again they sought refuge in Attica, and subsequently among the Dorians. Backed by a band of Dorians, they once more made for the Peloponnese. At the Corinthian isthmus they met the army of the Pelopidæ, their chief opponents, under the command of Echemus, king of Tegea. In single combat with this chief, Hyllus, the Dorian leader and son of Hercules, was killed. Hereupon his followers retired, after promising to make no further attempt on the Peloponnese for 50, or, as some say, 100 years from that time. They broke their promise, however, for, 30 years after the Trojan War (which itself began 10 years after the death of Hyllus), Cleodæus, the son of Hyllus, headed the third expedition which, like its predecessors, failed. Cleodæus fell in battle, and his son Aristomachus, who, 20 years later set out to avenge his death, met the same fate. The fifth attempt was at length successful. Temenus, Cresphontes, and Aristodemus, the three sons of Aristomachus, fitted out a powerful fleet on the Corinthian Gulf, and with the assistance of the Ætolian Oxylus, defeated the Peloponnesian forces under Tisamenes, the grandson of Agamemnon, and reduced the whole of the Peloponnese except Achaia and Arcadia. The conquerors then proceeded to divide the spoil. Cresphontes obtained Messenia; Argos was allotted to Temenus; and Lacedæmon to Procles and Eurystheus, the two sons of Aristodemus, who had been killed just before the expedition set sail. The conquered natives were either driven into exile, or reduced to slavery.

Thus was accomplished the great event of the "Return of the Heraclidæ." The traditionary accounts of it vary considerably in many of the details, many of which are no doubt purely mythical. But that under the myths there lies a substratum of historical narrative is universally agreed. But it is difficult, nay impossible, to say where the myths end and the history begins. In the meantime, we may with most safety accept the verdict of K. O. Müller in his *Dorians.* After carefully comparing all the legends about the Heraclidæ, as found in the classics, that scholar inclines to deny the conclusions of the ancients that the Peloponnese was conquered by Dorian adventurers under Achæan chiefs. He attributes to a later period those parts of the legend that described the Heraclidæ as the sons of the Tirynthian Hercules, and prefers to trace them back to a Doric hero of the same name. Historically it is not true that the Peloponnese was thus early and totally subdued. Its subjugation by the Dorians was reserved to a much later date.

HERACLIDES, surnamed PONTICUS, a Greek miscellaneous writer, was a native of Heraclea in Pontus (whence his surname), and flourished in the fourth century B.C. He was a man of wealth, and indulged his taste for travel and literature by removing from his birth-place to Athens, where he studied under Plato, whose favourite pupil he is said to have become. He wrote voluminously upon a great variety of topics; but of his numerous works only a small fragment *On Statecraft* has descended to us. This essay was first printed with the *Variæ Historiæ* of Ælian, at Rome, in 1545; but the best editions are those of Köler, Halle, 1804, and Coraes, Paris, 1805. The *Homeric Allegories*, which used to be fathered upon him, are the work of a very different hand. Of Heraclides' personal history nothing is known, except that he was a very vain man, very fond of good living, and very fat. There were some silly stories afloat about him. On his death-bed he is said to have requested a friend to hide his body as soon as he died, and to put a serpent in its place, that his townsmen might believe that he had been carried off to heaven. But this and the other trifles to the same effect may very safely be rejected.

HERACLITUS, of Ephesus, the "Weeping Philosopher," as he was called from his gloomy and sombre views of life, may be identified with the Ionian philosophy, though he held many of his tenets independently of it. His era has been much disputed. According to Fynes Clinton, his *floruit* may be assigned about B.C. 513. His father was one of the leading citizens of Ephesus, with means ample enough to send the future philosopher abroad to enlarge his mind by foreign travel. His name is variously given as Blyson, Bioson, or Bauson. On his return home Heraclitus was offered the chief-magistracy of Ephesus, but he waived the honour in favour of a younger brother. He had little sympathy with the character of his fellow-townsmen, and used to play at dice with little children in the streets near the great temple of Diana, saying that he would rather throw away his time on this frivolous sport than undertake the task of governing such wretches as the Ephesians. He is said to have begun the study of philosophy under the Pythagorean Hippasus of Metapontum; others say, of the Eleatic Xenophanes, but he claimed for himself, and on good grounds, the merit of being entirely self-taught. His unsocial and caustic humour remained with him to the last, and even grew in bitterness with his advancing years. To such an extreme did he carry it, that he at length retired to the mountains and refused all further intercourse with his kind. Limiting his diet to vegetables, he soon brought on a mortal disease, which compelled him to return home. But he only came back to die. At the time of his death he is said to have reached his sixtieth year. It is not necessary to repeat the silly stories about the manner of his death.

The philosophy of Heraclitus was embodied in a prose work entitled Περὶ φύσεως *(On Nature).* The style of this work was so obscure that it gained him the title of σκοτεινος, which, however, may have a reference to the gloomy tenor of his general views. It must also be borne in mind that at the time Heraclitus wrote there was no good prose philosophical style in existence. Verse had, till about his time, been the favourite vehicle of thought, and it was not to be looked for that the earliest prose-writers should make the leap all at once from a poetical to a purely scientific way of regarding common things. The language of Heraclitus, accordingly, had a strange and mysterious import, which he himself happily compared to the utterances of the sibyl. The object of all philosophy, according to him, is to discover the vital principle that inheres in all the phenomena of nature. This principle he held to be fire; not the fire of domestic life, but a kind of hot and elastic fluid "self-kindled and self-extinguished," which, subtilely permeating everything, developes and moulds it according to fixed laws into various forms. In one of its modifications this fluid, as the soul or principle of life, is endowed with intelligence and powers of ceaseless activity. In this way everything that exists is merely seen at the moment; it is undergoing a change, and consequently exists, and does not exist at the same moment. It is this ceaseless activity that creates in the subjects of its action a constant tendency to want on the one side and satiety on the other. These forces meeting in certain degrees of intensity, produce the phenomena of life and death. For a final cause of all the changes going on in nature, Heraclitus appeals to destiny. With him, whatever is, is right; and in his moral system he laid down as the highest good, a perfect acquiescence in the decrees of that overruling destiny—a sort of philosophic fatalism, which was afterwards worked out under a different form by the Stoics, and again appears in a different guise in the Hegelian philosophy.

The philosophy of Heraclitus has been constructed out of fragments of his works preserved in Plutarch, Clemens of Alexandria, and Sextus Empiricus. These fragments were collected by Henry Stephens, and published by him along with some others, under the title of *Poësis Philosophica*, Paris, 1573. A detailed analysis of his doctrines is given by Brandis and by Ritter in their respective histories of ancient philosophy.

HERACLIUS, one of the most remarkable of the Roman Emperors of the East, reigned from A.D. 610 to 641. He was first brought into notice by the success of his attempt against the Emperor Phocas, whose throne he usurped. After assuming the purple, he began to display that extraordinary energy of character which marked the first years of his reign. He restored discipline to the army, renewed the treaties with foreign powers, and prepared for war against the Avars, who had devastated Thrace, and were marching on Constantinople, when they suddenly saw fit to retire to their homes beyond the Danube. The next foe he had to meet was Persia, whose illustrious general, Sarbar, after taking Jerusalem, had fought his way into Africa, had taken Alexandria, and by devastating the African granaries of the empire, had reduced Constantinople almost to starvation. Another Persian army laid waste Asia Minor; and the King Chosroës (Khosru), emboldened by victory, called on Heraclius to renounce Christianity and worship the sun. During all this time the Roman Emperor was quietly but vigorously organizing his defence, and when all was ready he crossed over into Asia with his legions, defeated the enemy in every encounter in a five years' war (622–627), and penetrating into the very heart of the Persian Empire, seized and pillaged the royal palaces, from which he carried off spoils of untold value. He returned to his capital in triumph, and received the congratulations of every potentate from the Indus to the Atlantic, on having for ever crushed the hereditary foe of his race. Better still, he received the blessings of his own subjects, whom he had endeared by his victory, and by splendid exhibitions of personal valour in nearly every battle which he fought. But another power had in the meantime struggled painfully into existence in the East, which Heraclius would have done well to anticipate. Mohammed and his Arabians having conquered every foe that opposed them, found themselves at length confronted by the Roman Empire of the East. A pretext for war between powers contending for the sovereignty of the world was not long wanting, and Heraclius, whom disease and weakness prevented from heading the Roman legions in person, saw the fruits of his long and bloody wars with Persia wrested one by one from his grasp. The contrast between his declining and his opening years became now fatally apparent. Sunk in a slothful sensuality, which he alternated with the excitement of religious controversy, he allowed his empire to fall to pieces before his eyes, and helped on that process of decay which some centuries later offered the Roman Empire of the East an easy prey to the crescent of the False Prophet. Heraclius died in 641, and was succeeded by his eldest son Heraclius, who reigned under the title of Constantine III.

The character of Heraclius is a curious riddle which it is not very easy to solve. His Persian campaigns are admitted by modern strategists to rank him among the greatest soldiers of antiquity. His personal valour was not surpassed by that of any hireling soldier of his day; while his talents as a diplomatist, so long as he chose to exert them, bade fair to re-establish the Roman Empire on its ancient footing of glory and security. In marvellous contrast to these great qualities stands the vicious imbecility of his later years, arising partly from physical causes, and partly from moral defects. A parallel to his character, in some respects a very striking one, is to be found in our own Edward IV. Both were in a sense usurpers; both unexpectedly displayed great military talents and the most extraordinary personal courage; both gained great victories against great odds; and both debased great faculties by the most miserable vices. The parallel holds good even to the destiny of their respective families.

HERALD (Gr. κῆρυξ, Lat. *fecialis*, *fætialis*, *vel fetialis*, Ger. *herold*, Fr. *héraut*, Span. *heraldo*). As the Germans were the first among modern European nations to reduce heraldry to a system, and as we are undoubtedly of German origin, it may be safely concluded that the English word is derived from the German.

Heralds appear to have been important and prominent persons among the older Asiatic nations, as well as among the Greeks and Romans, and their privileged and almost sacred character was generally recognised. Though the herald of Nebuchadnezzar is the only one mentioned in Holy Writ,[1] these officers are frequently alluded to by the Greek poets and historians, while the members of the Roman College of Heralds established by Numa were generally selected from noble families, and held in very high estimation.[2] Their most ancient and most important duties were to carry messages of amity or defiance to foreign powers, and to proclaim the national will or that of the sovereign on great occasions.

In the middle ages the presence of heralds at tournaments was considered as indispensable as that of the knightly combatants themselves; and the task of instructing young knights on their installation, very generally devolved on the senior heralds or kings-of-arms.[3] But their chief glory and source of wealth passed away with the days of chivalry; their ambassadorial functions have also fallen into desuetude; and now their chief occupation is to record and illustrate pedigrees, and armorial bearings (see HERALDRY), and to marshal great national solemnities.

Heralds were in high repute in Germany and France before they were known in this country. Hither, however, they came from the latter country in the days of chivalry, and soon found favour with those whose high descent and noble deeds formed their constant themes of praise.

Mention is made of Chester herald so far back as the reign of Richard II.; but the first English herald advanced to a higher dignity appears to have been William Tyndale, appointed Lancaster king-of-arms by Henry IV. In Scotland, at the coronation of Robert II. in March 1371, Lyon-king-of-arms appears to have been summoned with his attending heralds by the Lord-Marischal of Scotland, and then sworn and crowned. In England, before the institution of Heralds' College, the heralds belonged exclusively to the Royal Court as "Household Servants," though there are instances, after that period, of their being permanently attached to, or occasionally employed in the households of powerful noblemen,[4] gentlemen of good estate, and dignitaries of the Church. Thus we find that the fifth Earl of Northumberland, of 1512, assigned x. marcs yearly to each of his heralds, and v. marcs to each pursuivant; and we are told by Cavendish that the pursuivant of Cardinal Wolsey carried before his lord "a great mace of silver gilt."

It may now be proper to notice in their order the three existing associations of heralds in the United Kingdom—viz., the College of Arms, or Heralds' College of England; the Lord-Lyon's Court, or Heralds' Court in Scotland; and the Office of Arms, in Ireland.

HERALDS' COLLEGE. In 1483 Richard III. constituted the heralds of England a collegiate body, like the *collegium fecialium* of Rome, incorporated them by letters patent, and assigned to them as an habitation[5] "one messuage, with the appurtenances, in London, in the parish of All Saints, called Pulteney's Inn, or Cold Harbore, to the use of twelve the most principal and approved of them." Edward VI. freed them from taxes, and Philip and Mary were also benefactors to the institution. In the latter reign Stanley or Derby House was granted to the heralds in lieu of their first habitation. of which they had been deprived by Henry VII.

The present college, situated in Doctors' Commons, was built, after a design of Sir Christopher Wren, on the site of old Stanley House, which was burned in the fire of London. The president or superior of the college is the Earl-Marshal of England, who nominates, for appointment by the sovereign, all the members of the collegiate chapter, consisting of three kings-at-arms, six heralds-at-arms, and four pursuivants-at-arms.

The office of *Magister Marescallus*,[1] or Chief Marshal, is of great antiquity, and appears in the reign of Stephen to have been hereditary in the family of *Marescalli.* This officer was styled at different times *marescallus regis*, *marescallus Angliæ*, and *comes marescallus.* The Earl-Marshal is eighth in rank among the great officers of state; and the dignity is now, by virtue of a grant of Charles II. in 1672, hereditary in the family of Howard Duke of Norfolk.

The royal commands regarding great public ceremonies are addressed to the Earl-Marshal; and under his direction are prepared the programmes which regulate order and precedence on such occasions. He still holds a court in Heralds' College, though it is but the shadow of what was in olden times the court of chivalry or honour, as constituted by Richard II. From the decisions of the Earl-Marshal an appeal may be made to the Sovereign in council.

The three kings-of-arms are styled Garter, Clarenceux, and Norroy. Of these Garter is the principal. As may almost be inferred from his name, one of his chief duties is to assist at all ceremonies connected with the Order of the Garter, either at home or abroad. "He was ordained," says Ashmole,[2] "by King Henry V., with the advice and consent of all the knights' companions, who, for the honour of the order, was pleased he should be the principal officer within the College of Arms, and chief of the heralds." The first Clarenceux king-of-arms was also appointed by Henry V., and Norroy was created by Edward IV. When the College of Arms was erected, the kings-of-arms proceeded to divide England into two districts—viz., north and south of the Trent. To Clarenceux the southern, and to Norroy the northern provinces were committed. Hence they were called the "provincial kings," each having jurisdiction independent of the other, while Garter, as principal, presided over all.

The six heralds are styled Chester, Lancaster, Richmond, York, Windsor, and Somerset. They are esquires by creation, and rank according to seniority of appointment.

The four pursuivants are Portcullis, Rouge-dragon, Bluemantle, and Rouge-croix: and though these officers form a class subordinate in rank to the heralds, they now generally succeed the latter on any vacancy occurring by death or preferment.

Though the members of this college have certain limited stipends, and fees on the creation of peerages, baronetcies, &c., their chief source of income is derived from fees for professional advice and assistance in tracing pedigrees and the descent of properties and titles, for the registration of nominal and armorial additions and distinctions sanctioned by the sovereign, and for granting coats of arms when the royal assent is not indispensable.

The importance of genealogies in relation to history is too obvious to require comment; and in countries like our own, where one branch of the legislature is in its nature hereditary, the most carefully compiled genealogies are essentially necessary.

The older records of the college are most curious, valuable, and authentic. Among these are the heralds' visitations of counties—documents giving the results of certain progresses made by the heralds through different districts of England. Though various visitations undoubtedly took place at an earlier period, they seem to have proceeded on no regular commission till 1528. The visitation books, the most valuable portion of the college library, contain elaborate pedigrees and representations of the coat-armour of the nobility and gentry existing in the counties, and at the dates, to which they refer; and they tend to throw much light on national as well as family history. When the 6th Duke of Norfolk, at the request of Evelyn,[3] bestowed the Arundelian library on the Royal Society, he stipulated that the herald's chief officer should have those that concerned heraldry and the marshal's office, books of armoury, and genealogies; and these now form part of the College library.

The daily occupation of the various members of the College of Heralds naturally leads them to much antiquarian research, and in this field and in general literature many of them have exerted themselves successfully. But above all, the names of Camden, Dugdale, Ashmole, and Vanbrugh shed peculiar lustre on this ancient institution.

Besides the members of Heralds' College, extraordinary heralds are occasionally appointed to assist the former on great occasions, and there is an officer called Bath king-of-arms, permanently attached to the Order of the Bath.

Heralds' Court, or Lord Lyon's Court in Scotland.—According to Chalmers, the origin of Lyon king-of-arms, and the body of Scotch heralds, is lost in the mist of antiquity.[4] Their first appearance on record was, as already stated, at the coronation of Robert II. in 1371. At that time they were apparently dependent on the Great Marischal, or Lord-Marischal of Scotland; bearing the same relation to him that the English heralds bore to the Lord-Marshal of England. The dignity of Marischal of Scotland seems to have been hereditary in the family of Keith for several centuries. The first who bore the title lived in the time of Malcolm II., but no mention is made of the title Earl-Marischal till 1458. The dependence of the heralds on this nobleman ceased, however, long prior to the extinction of the family of Keith, Earls-Marischal in Scotland; and Lyon has for an extended series of years held his place by commission under the Great Seal, and has been recognised as the head of the Scotch office of arms. He doubtless derives his name of *Lyon* from the cognizance of Scotland, as one of the *signiferi* or *pursuivants* is called Unicorn, in allusion to the supporters of the national shield. Lyon is generally appointed for life, is the sole principal herald or king-of-arms, and holds his court in the General Register-House at Edinburgh. The last grant of the office of Lyon was made by George III. in 1796 to the then Earl of Kinnoull and to his son. The latter is now Lord-Lyon.

Jurisdiction in arms, which at one time was vested in all the heralds jointly, is now exercised by Lyon alone, who performs the duties of his office by deputies of his own appointment. This devolution of duty on a deputy may be traced nearly as far back as 1663, when Lyon first obtained the title of Lord-Lyon, king-of-arms.

The heralds, six in number, are styled Rothesay, Marchmont, Albany, Ross, Snowdon, and Islay, and rank according to seniority. The pursuivants are also six in number, and bear the names of Kintyre, Dingwall, Carrick, Ormond, Unicorn, and Bute. All these officers receive their commissions from the Lord-Lyon, and usually for life, and their duty is now confined to attendance at royal proclamations, coronations, and other great public ceremonies.

[4] Chalmers' *Caledonia*, vol. i., p. 762, note.

The *macers* at one time were reckoned among the officers at arms, but from the institution of the Court of Session or College of Justice, they were entirely detached from the heralds' office, and now wait only on the judges of the supreme law courts. After the *pursuivants* are accordingly to be ranked the *messengers*-at-arms, of whom there are many in every county. They are admitted and removed by the Lord-Lyon, and their duty is to execute the "process and letters" of the superior courts. The jurisdiction and authority of the Scottish king-of-arms is thus twofold; one over the officers at arms, in which respect he may not inaptly be regarded as, in some respects, at the head of the executive department of the law in Scotland; and the other in relation to bearings and ensigns armorial. The Lord-Lyon is now empowered by statute "to assign arms "to all 'virtuous and well deserving persons' on their application to him for the same; and this whether they belong "to families already possessing them or not." There is a marked difference between the present and the old law on this subject; for, by 12 Jas. VI., cap. 127, Lyon was empowered to *imprison during his pleasure* such as improperly assumed armorial bearings![1] To the court of the Lord-Lyon are attached a procurator-fiscal, to sue before his lordship; a clerk and registrar, and a messenger who acts as macer. The principles which regulate the Herald's Court at Edinburgh are stated in the Report, dated 1821, of the Commission on Courts of Justice in Scotland.

The decisions of the Lord-Lyon are now subject to the review of the Court of Session, though probably at one time his judgments, like those of the Earl-Marshal of England, could only be reconsidered by the Sovereign in council.

Office of Arms for Ireland, or Ulster's Office.—It is situated in the Record Tower of Dublin Castle; and the professional staff consists of one king-of-arms, two heralds, four pursuivants, one registrar, and one clerk of the records. The chief officer is styled Ulster king-of-arms. He holds his appointment from the Crown, and acts under the immediate direction of the Lord-Lieutenant of Ireland. According to Rymer,[2] the first Ulster king-of-arms, Bartholomew Butler, was appointed by letters patent of Edward VI., dated at Westminster, June 1, 1552; and Philip Butler, son of Bartholomew, was on the 28th of the same month appointed by letters patent Athlone herald. The two heralds of the present day are called Cork and Dublin; and the senior pursuivant bears the title of Athlone, the others being called pursuivants of St Patrick. The functions of Ulster's office are very similar to those exercised by the English College of Heralds. The records of the Irish Office of Arms consist of pedigrees of the Irish nobility and gentry, certificates of their deaths and funerals, &c., from the time of Henry VIII. down to 1700; and grants of arms, &c., for the same period, and down to the present time, with volumes relating to religious ceremonies, processions, &c. It would appear, from an official list, or heraldic calendar, published by the Registrar of the Irish Herald's Office in January 1846, that upwards of 1850 noblemen and gentlemen then living (including the members of their several families) had recorded their pedigrees, and registered their armorial bearings in that office. (H. G. R.)

HERALDRY.

HERALDRY is the science of blazoning or describing, in appropriate and technical terms, all that belongs to the bearing of armorial insignia. It likewise professes to describe the duties of the officers appointed as heralds to perform certain solemnities at coronations, the creation of peers, and such like public ceremonies. The consideration of the subject here will be confined principally to the science of coat-armour, and its various accessories.

Whatever causes led to the introduction of heraldry, it is certain that two circumstances contributed powerfully to its real development—first, the institution of jousts and tournaments in the time of Henry I.; and, secondly, the crusades in the time of Richard I. That its foundation was subsequent to the Norman Conquest may be proved negatively; for, in the Bâyeux tapestry of that period, no sign of the heraldic shield is to be found. It was not till the reign of Henry II. that *hereditary* armorial bearings seem to have been adopted. On the accession of that monarch he assumed the lions of Normandy and Poictou, and added to them the lion of Aquitaine. The shield at Mans of Geoffrey Plantagenet, who married the daughter of Henry I., and who died in 1150, affords one of the earliest specimens extant of heraldic bearings, as used by a subject. In the reign of Richard I. armorial bearings or shields became numerous; and from this period we may safely date the establishment of hereditary heraldry.

One essential principle in heraldry is its *hereditary* character; but there is reason to believe that neither at the earliest period, nor in several instances subsequently, was it so entirely of this nature. On reference to the oldest rolls of arms, it will be found that those of sons and of collateral relations differed from each other, and from the paternal coat, very materially. Arms first appear on the seals of private families in the reign of Richard I., at the close of the twelfth century. Those attached to the Barons Letter to the Pope in 1300, deposited in the chapter-house at Westminster, afford excellent evidence of the use of armorial ensigns at that period. The prevalence of arms during the reign of Edward I. is shown on the monumental brass of Sir John D'Abernon, 5th Edw. I. Upon encaustic tiles, and in architectural decorations of the thirteenth century, arms form the frequent subject of ornaments. Some of the earliest instances of heraldry may be found on monumental sculptured effigies, as in the Temple Church, London; and there is an instance on that of Sir Richard de Montfort at Hitchenden in Buckinghamshire, of about 1270. Of somewhat earlier date, there is a very fine specimen on an incised slab, in Bitton Church, Somersetshire, over Sir John Bitton, who died in 1227.

Rolls of arms in the reigns of Henry III., Edward I., and Edward II., display the simplest forms of heraldry. The roll of Carlaverock, A.D. 1300, is peculiarly rich and resplendent. From these evidences are derived the earliest heraldic ordinaries.

Shields varying in form at different periods are amongst the first recipients of heraldic figures. Arms are found emblazoned on the *surcoat*, a military garment. This practice seems to have originated with the Crusaders to distinguish the many different nations serving under the banner of the Cross, for at first the surcoat was without any mark of distinction, except that of colour. Surcoats were first worn in England in the time of Henry II., but they displayed no armorial bearing till the reign of Henry III. The monumental effigy of De Lisle in Bampton Church, Cambridgeshire, gives an instance of arms emblazoned on a surcoat in the reign of Henry III. (1216–72). The surcoat continued to be worn till about the time of Edward II. (1307), and gave rise to the designation of

---

[1] See *Abridgement of Scotch Acts*, p. 162, Edin. 1685.

[2] Rymer's *Fœdera*, tom. xv., p. 305.

"Coats of Arms." The *jupon* and *cyclas*, which succeeded the surcoat, and continued in use till about the end of the reign of Edward III. (1370), were likewise emblazoned with arms. The effigy of Sir Oliver de Ingham, in Ingham church in Norfolk, A.D. 1343, affords an example of this sort. The *tabard* was the next military garment, which became general during the reign of Richard II. (1377-99), and continued till that of Henry VIII. (1509-47). The monumental brass figure of Sir George Felbrigg at Playford in Suffolk, A.D. 1400, represents him in his tabard of arms. After the reign of Henry VIII. the tabard ceased to be worn, except by the heralds, who have uninterruptedly continued down to the present time to wear them embroidered with the arms of the sovereign.

Armorial insignia were borne on *banners* from the earliest date of heraldry; in later times the forms of banners varied according to the degree of the person whose arms were displayed upon them. They were not only used in the field, but floated over the castles of the nobility, and were carried at their funerals, and hung up in churches with other heraldic achievements.

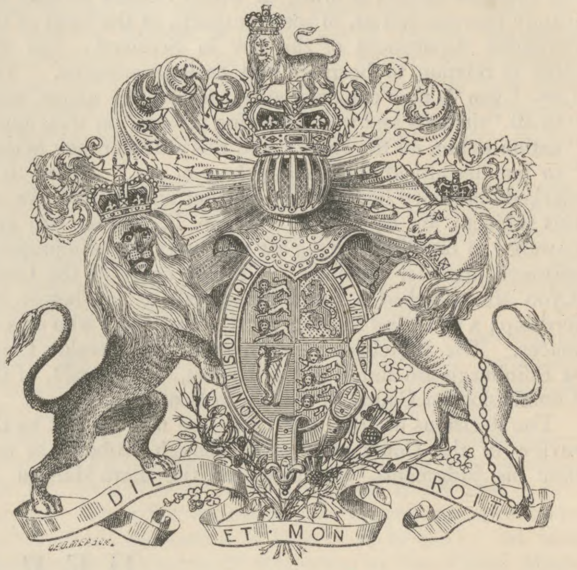
Arms were impressed on our gold *coins* immediately on their first introduction, in the time of Edward III.; and in the time of Henry VII. on silver coinage.

The first instance of the use of arms on the *seals* of the sovereigns of England was upon the Great Seal of Richard I., which bore *two lions combatant.* Henry II. is said to have given these arms to Richard; and to his other son John, *two lions passant,* which may be seen on his seal. Both Richard and John afterwards bore *three lions passant guardant.* Alexander II. (1214-1249) is said to have been the first of the kings of Scotland who bore the arms of that kingdom on his seal.

Having thus given an outline of the origin of heraldry, and of the earliest evidence of the period of its adoption, it may be as well to notice that arms have been *conventionally* attributed to several kings and princes who preceded that period. Thus certain arms have been assigned to the Saxon kings of England, and to the Conqueror and his sons. Without, however, more particularly referring to the arms so assigned by ancient writers on heraldry to various heroes and personages of the first ages, we may feel surprised that so late as the time of James I. of England, Segar, Garter King of Arms, compiled for that sovereign a collection of arms of the kings of England long prior to the twelfth century. And this compilation obtained as settled a notoriety for heraldry of the tenth and eleventh centuries as if it had then existed in all the pomp and splendour it afterwards acquired. It is quite evident, notwithstanding, that long prior to Segar this conventional heraldry was understood, as the arms ascribed to Edward the Confessor appear sculptured in Westminster Abbey as early as the time of Edward II. (1307-27), and were borne by Richard II. (1377-99) in honour of the martyred saint and king, whom he adopted as his patron.

Whatever were the real motives and circumstances that occasioned the display of those specific bearings upon shields, which constitute the *ensign armorial*, it seems that before hereditary heraldry supplied the charges for the shield, it was usual for knights to have their shields blank till they had achieved some deed which was worthy of being pourtrayed. In the infancy of heraldry the armorial shield was confined to knights, and was given only by princes or lords paramount. Subsequently, when other classes of the community became important, or possessed influence in the state, arms became the insignia of families generally, without the degree of knighthood being necessary. The earliest charges in heraldry appear to have been adopted in reference to military achievements and deeds of courage. Some had allusion to personal qualities in the bearer; others to the spoils of the enemy; and very frequently to surnames, after they became common. Early authors enumerate arms of dominion, pretension, concession, and patronage, with other similar ramifications. But generally these heraldic ensigns will range themselves into three principal classes—Arms of *states*, of *communities*, and of *persons* and *families.*

ARMS OF STATES are those assumed by sovereign princes, which denote their respective kingdoms, and there is scarcely an European state, however small, that has not displayed some distinguishing heraldic ensign or bearing. We shall briefly notice those which appertain to the United Kingdom.



THE ROYAL ARMS OF ENGLAND.—It has been already stated that hereditary heraldry did not originate earlier than the reign of Henry II.; but the arms said to have been borne by the Conqueror and his son William were *gules, two lions passant guardant or.* Henry II. is said to have borne *three lions,* though no armorial bearing appears on his seal. These arms, *gules, three lions passant guardant in pale or*, form those of England, and were so borne by the kings of England till the reign of Edward III., who, in 1340, quartered with them, in the first quarter, the arms of France, azure, *semeé of fleurs-de-lys or.* Thus the arms of the kingdom continued till the latter part of the reign of Henry IV., when the fleurs-de-lys of France were reduced to *three or.* No alteration occurred in the royal achievement during any of the succeeding reigns till the accession of James VI. of Scotland to the throne of England, when that sovereign introduced the royal arms of Scotland into the second quarter (France and England occupying the first and fourth quarters), and the arms of Ireland into the third quarter. The royal arms were thus borne by all the monarchs of the House of Stuart, till the reign of Anne. It must, however, here be noticed that William III. bore over the quarterings of the royal arms those of his Dutch dominions—the House of Nassau. In the reign of Anne an important change again took place, occasioned by the union of England and Scotland; and the arms of these kingdoms were impaled in the first and fourth quarters (England on the dexter, Scotland on the sinister); France was removed to the second; and Ireland retained its former position. On the accession of the House of Brunswick, in 1714, the fourth quarter in the royal shield gave place to the arms of his Majesty's German dominions, an arrangement which continued till 1st January 1801, when upon the Union of Great Britain and Ireland the arms of France were excluded; England occupied the first and fourth quarter; Scotland the second quarter; and Ireland its old position in the third quarter; over all, on an escutcheon of pretence, were placed the arms of Hanover, ensigned with the electoral bonnet, which was in 1816 displaced to give way for the Hanoverian crown. Thus the royal achievement continued to be borne till the end of the reign of William IV., when the arms of Hanover were removed upon the sovereignty of that kingdom being severed from the crown of England. The royal arms were then simply those of the three kingdoms, as now borne by her present most gracious Majesty. It may be remarked that in Scotland the preference has been given to the royal arms of that kingdom, by placing them in the principal place on many of the official seals in use for that part of the United Kingdom.

The Royal Arms of Scotland are,—*or, a lion rampant, within a double tressure flory and counterflory, gules.* As has been already observed, they appear first on seals in the reign of Alexander II. (1214-49). It is very probable that they had an earlier origin; but they are not so remote as is supposed by an author, who tells us that the fleur-de-lys was assumed by Achaius King of Scotland before the year 819, who is said to have taken them into his imperial ensign to adorn the double tressure, the badge between him and Charlemagne of France.

The Arms of Ireland were said originally to have been *azure, three crowns in pale or;* and, in support of this supposition, some Irish coins of the times of Edward IV., Richard III., and Henry VII., have been referred to. It is only on one of these coins (of Edward IV.) that the crowns are in a shield, and are there *two and one.* The augmentation granted by Richard II. to Robert de Vere, Earl of Oxford, whom he had created Duke of Ireland, has been adduced in favour of three crowns being the armorial ensign for Ireland; but in the grant nothing is said about that augmentation having allusion to that kingdom. *Azure, a harp or, stringed argent,* are given in a MS. in the Herald's College, in the time of Henry VII. or Henry VIII., as the arms of Ireland; and they were, on the accession of James I., so incorporated with the arms of England and Scotland in the royal shield.

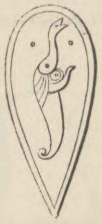
The Arms of the Principality of Wales.—On the seals of Edward, son of King Edward IV., and Arthur, son of Henry VII., as princes of Wales, were *three lions passant regardant, with their tails between their legs, and reflexed over their backs;* the field being *argent,* with the lions *gules,* as they appear in several MSS. Other arms, however, are ascribed to the three provinces of Wales—viz., those of North Wales, *quarterly gules and or, four lions rampant, counterchanged;* South Wales, *gules, three cheveronels argent, in chief two lions combatant or;* and Powisland, *or, a lion rampant, gules.* None of these arms ever appeared upon any of the royal seals used by the sovereigns of England.

Arms of Communities.—Under this class of ensigns armorial may be comprehended those of ecclesiastical and lay corporations. The former, being those of Bishops' sees, abbeys, monasteries, and other religious houses, were principally derived from the arms of founders, or composed of figures having allusion to the church; the latter those of municipal corporations, cities, and towns, trading companies, and other corporate bodies, had greater variety of origin. The arms of towns were probably derived from some powerful neighbouring family, as in the case of Chester, which bore those of the ancient Earls of Chester, dimidiated with the royal coat of England. The town of Yarmouth and the Cinque Ports, as well as other towns, bore arms having allusion to the principal occupations of the inhabitants, or in reference to their locality. The arms of Yarmouth and the Cinque Ports were dimidiated with those of England, probably as early as Edward I.'s time, and are so borne at the present day. The arms of London, as the principal city of England, are those of the patron saint St George, with the sword of St Paul in the dexter canton of the shield. The arms of trading companies, and other inferior corporations, usually display the instruments of the "craft and mistery," or some other design connected with the object and nature of such incorporations. There are instances of very early grants of arms to such bodies.

Arms of Persons and Families.—It has been already stated how and at what time arms became the distinguishing marks of personal honour. They were frequently granted by the sovereign, or by some one authorized by him. The assumption of arms by private persons was restrained by Henry V.; who, by proclamation in the fifth year of his reign, declared that no man, unless he had borne arms at the battle of Agincourt, should assume arms except by right of inheritance, or under grant by competent authority. For the observance of this regulation, and further to restrain the voluntary assumption of arms, the heralds visitations were instituted, the earliest date of which was in 1528, and the last commission for that purpose was issued in the reign of James II. The crown still retains the power of granting arms, notwithstanding the patents which have been granted to the kings of arms from very early times to the present, and reserves to itself the granting of supporters to commoners, and of permitting persons to use the arms of other families, whose property they may inherit, or whose memory they wish to preserve.

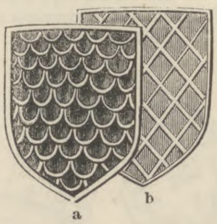
I. OF THE SHIELD.

Shields containing arms varied at different periods in their form. The following are some examples:—



1.

2.

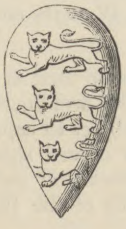


3.

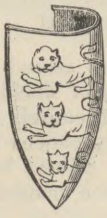
No. 1. From the Bayeux tapestry, and introduced by the Normans, *c.* 1066.

No. 2. A similar shield from a font in Wansford Church, Northamptonshire, about the time of Rufus, *c.* 1087.

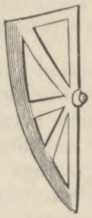
No. 3. Two shields (a) representing rustred armour, and (b) mascled armour, *anno* 1100.



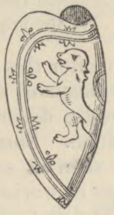
4.



5.



6.



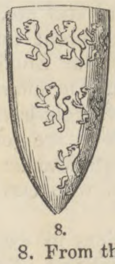
7.

No. 4. Kite-shaped; in the reign of Henry II. Armorial bearings are first found on shields in his reign.

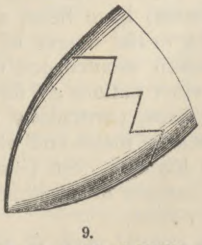
No. 5. From the seal of Richard I.

No. 6. From the seal of Adam de Herford, *anno* 1220, but of the time of Richard I.

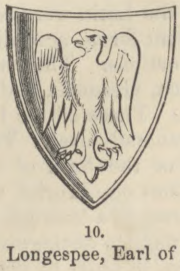
No. 7. From the seal of Alexander II. king of Scotland, *c.* 1214.



8.



9.

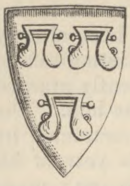


10.

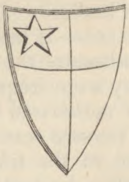
No. 8. From the monument of William Longespee, Earl of Salisbury, who died in 1224.

No. 9. Shield of Eudo de Arsic, who died in the latter part of the reign of Henry III.

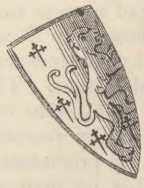
No. 10. Peter, Earl of Richmond, *anno* 1248.



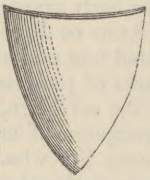
11.



12.



13.



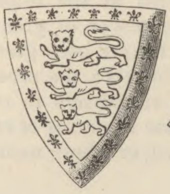
14.

No. 11. From the monumental effigy in the Temple Church, *c. temp.* Edw. I. De Roos.

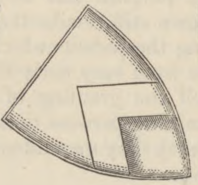
No. 12. Robert de Vere, Earl of Oxford, who died in 1221.

No. 13. From the effigy of a knight of the Montford family, 1286.

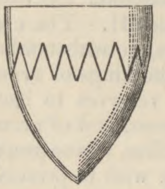
No. 14. A knight's shield, *anno* 1295.



15.



16.

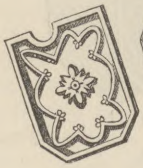


17.

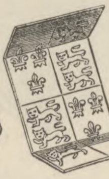
No. 15. From the monument of John of Eltham, Earl of Cornwall, in Westminster Abbey. He died in 1329.

No. 16. From the brass of Sir John D'Abernon, at Stoke D'Abernon in Surrey, who died in 1327.

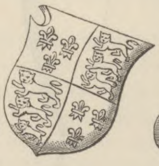
No. 17. From the monument of Sir John Harsick at South Acre, in Norfolk, 1384.



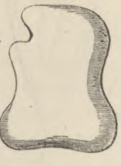
18.



19.



20.



21.

No. 18. From the seats in the choir of Worcester Cathedral in the time of Henry IV.

No. 19. From the screen to the monument of Henry V. in Westminster Abbey.

No. 20. A shield of the time of Edward V.

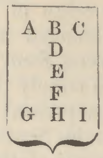
No. 21. A shield from about the time of Edward IV. to the middle of the reign of King Henry VII.

Soon after this period shields ceased to be used as defensive weapons, and the forms of shields for architectural or domestic decoration became entirely subject to caprice and fashion. Some very fine specimens of carved shields may be seen in engravings of private houses and public buildings in works illustrating the topography of the times of the Tudors and Stuarts.

The *shield* or *escutcheon* is the field or ground on which are represented the figures that make up a coat of arms; and wherever these figures may be fixed, they are represented on a plane or superficies, the form of which resembles a shield.

Shields (in heraldry called *escutcheons* or *scutcheons*, from the Latin word *scutum*) have been, and still are, of different forms, according to the usages of different times and nations. The modern escutcheons of the English, French, Germans, and other nations are formed in different ways. Those of the Italians, particularly of ecclesiastics, are generally oval. Those of maids and widows are generally of the form of a lozenge. Sir George Mackenzie mentions one Muriel, Countess of Strathern. who carried her arms in a lozenge, in 1284.

Armorists distinguish several parts or points in escutcheons, in order to determine exactly the position of the bearings they are charged with. Thus, in the annexed outline of an escutcheon,—



A is the dexter chief, B the precise middle chief, C the sinister chief, D the honour point, E the fess point, F the nombril point, G the dexter base, H the middle precise base, and I the sinister base.

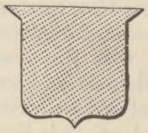
The knowledge of these points is of great importance, and ought to be well observed, for they are frequently occupied with things of different kinds. It is necessary to observe, that the dexter side of the escutcheon is opposite to the left hand, and the sinister side to the right hand, of the person who looks thereon.

II.—OF TINCTURES, FURS, LINES, AND DIFFERENCES.

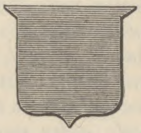
1. *Of Tinctures.*

By *tinctures* is meant the colours of shields and their bearings. According to the French Heralds, there are but seven tinctures in armoury, of which two are metals. The metals are gold, termed *or*; and silver, termed *argent*. The colours are blue, termed *azure;* red, *gules;* green, *vert;* purple, *purpure;* and black, *sable*. When natural objects are introduced into arms, they retain their natural colour, which is expressed by the word *proper*. Besides the five colours above mentioned, the English writers on heraldry admit two others, namely, orange, termed *tenny;* and blood-colour, termed *sanguine*. But these two are rarely, if at all, to be found in British bearings.

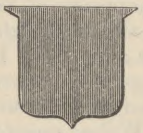
These tinctures are represented in engravings and drawings by dots and lines, which are the invention of the ingenious Silvester de Petra Sancta, an Italian author of the seventeenth century. Thus, 1, *or* is expressed by dots; *argent* needs no mark, and is therefore plain; 2, *azure*, by horizontal lines; 3, *gules*, by perpendicular lines; 4, *vert*, by diagonal lines from the dexter chief to the sinister base points; 5, *purpure*, by diagonal lines from the sinister chief to the dexter base points; 6, *sable*, by perpendicular and horizontal lines crossing each other; 7, *tenny*, by diagonal lines from the sinister chief to the dexter base points, traversed by horizontal lines; 8, *sanguine*, by lines crossing each other diagonally from dexter to sinister, and from sinister to dexter.



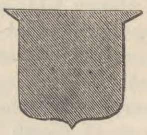
1.



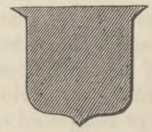
2.



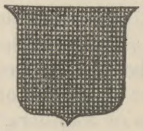
3.



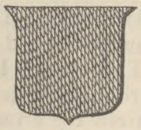
4.



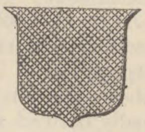
5.



6.



7.



8.

This mode of expressing the colours of heraldry was as early as the time of Charles II., as appears by engravings at that time, but was not adopted upon seals till about the reign of Queen Anne; and not in architectural decorations till our own times, when the fashion of imitating styles of the middle ages has become prevalent. It is amusing to the heraldic eye to discern that, amidst all the care taken to copy the details of the *Gothic* style in church-building, the heraldic shield is disfigured by adopting the lines used to denote heraldic tinctures, at once proclaiming a barbarous anachronism, if no other incongruity existed.

Some fantastic heralds have blazoned not only by the ordinary colours and metals, but by flowers, days of the week, and parts of the human body, and have been condemned for it by the heralds of all nations. Others lay it down as a rule that the coats of sovereigns should be blazoned by the planets, and those of noblemen by precious stones. According to this rule, which some think judicious, and others reprobate as absurd, the relative blazonry would stand thus:—

Or	Topaz	Sol.
Argent	Pearl	Luna.
Sable	Diamond	Saturn.
Gules	Ruby	Mars.
Azure	Sapphire	Jupiter.
Vert	Emerald	Venus.
Purpure	Amethyst	Mercury.
Tenny	Jacinth	Dragon's-head.
Sanguine	Sardonix	Dragon's-tail.

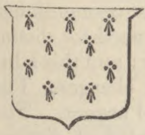
But in no instance does there occur throughout the official MSS. in the Herald's College this fanciful mode of blazoning arms. The heraldic terms of blazon are derived peculiarly from the French; and necessarily so, as in the twelfth century, when heraldry originated, Norman-French was the language in all proceedings connected with the government and jurisprudence of this country.

Metal should never be upon metal; nor colour upon colour. This rule, however, does not apply if a charge lies over any field composed of metal and colour. The English heralds give different names to roundels, according to their colours. Thus, if they be or, they are called *bezants;* if argent, *plates;* if azure, *hurts;* if gules, *torteaux;* if vert, *pomeis;* if purpure, *golpes;* if sable, *pellets;* if tenny, *oranges;* and if sanguine, *guzes.* The French, and all other nations, do not admit such a multiplicity of names for this figure, but call them *torteaux*, expressing the tincture.

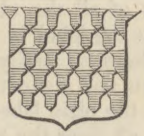
Bezants were so called from coins struck at Constantinople, the Byzantium of the ancients. *Gules bezanté* or, was the armorial bearing of Alcyn la Zouche, *temp.* Hen. III. Torteaux were borne as early as the time of Henry III. *Or, two bars gules, in chief three torteaux;*—Hugh Wake.

2. *Of Furs.*

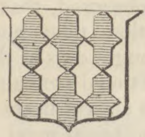
There are three different kinds in general use, namely, *Ermine*, which is a field argent, powdered with black spots,



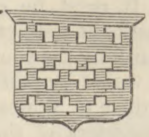
1.



2.



3.



4.

the tails of which terminate in three hairs (No. 1); *Ermines*, where the field is sable, and the powdering white; *Erminois*, where the field is or, and the powdering sable; *Pean*, where the field is sable, and the powdering or; *Erminites*, the same as ermine, with the addition of a red hair on each side of the black. *Vair* (No. 2), which is expressed by blue and white skins, cut into the forms of little bells, ranged in rows opposite to each other, the base of the white ones being always next to that of the blue ones. *Vair* usually consists of six rows; if there be more or fewer, the number ought to be expressed; and if the colours be different from those above mentioned, they should likewise be expressed. *Counter-vair*, when the bells of the same tincture are placed base against base, and point against point (No. 3). *Potent-counter-potent*, anciently called *vairy-cuppy*, as when the field is filled with crutches or potents counterplaced (No. 4). *Ermine* only, was the armorial bearing of the ancient earls of Brittany and Richmond in the twelfth century. *Ermines.*—Gules, a fess engrailed ermines, surmounted by a pale engrailed ermine.—Dyrwyn in some of the early rolls. Bruges, who was the first Garter, *temp.* Hen. V., bore ermine, a cross quarter-pierced ermines. *Erminois.*—Stringer, of Overthorpe in Yorkshire, bore three eagles displayed erminois in 1612. *Vair* only, was borne by Robert de Beauchamp, *temp.* Henry III.

3. *Of the Lines used in Arms.*

The field is sometimes parted by lines either straight or crooked. Straight lines are carried evenly through the escutcheon, and are of four different kinds,—viz., a perpendicular line |; a horizontal —; a diagonal dexter, ╲; a diagonal sinister, ╱. Crooked lines are those which are carried unevenly through the escutcheon.

1.

2.

3.

4.

5.

6.

7.

8.

9.

10.

11.

1, The engrailed; 2, the invected; 3, the wavy; 4, the embattled, or crenelle; 5, the nebule; 6, the regule; 7, the indented; 8, the dancette; 9, the dove-tail; 10, the battled embattled; and 11, the champaine.

These lines not only vary the disposition of colours in the field, but are also generally used to alter the character of the principal ordinaries; and were adopted in the earliest times of heraldry.

The principal reason why lines are thus used in heraldry, is to distinguish bearings which would otherwise be the same; for an escutcheon charged with a chief engrailed, differs from one charged with a chief wavy, as much as if the one bore a cross and the other a saltier.

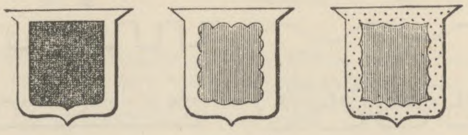
As the lines above mentioned serve to divide the field, it must be observed, that if the division consist of two equal parts formed by the perpendicular line, it is called *parted per pale;* by the horizontal line, *parted per fess;* by the diagonal dexter, *parted per bend;* and by the diagonal sinister, *parted per bend sinister.* If a field be divided into four equal parts by any of these lines, it is said to be *quartered.* Parted *per saltier* is made by two diagonal lines, dexter and sinister, crossing one another in the centre of the field, and likewise dividing it into four equal parts.

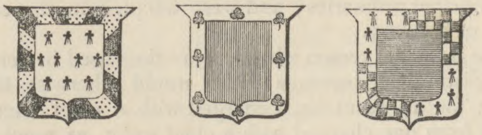
The escutcheon is sometimes divided into a greater number of parts, in order to place it in the arms of the several families to which the bearer is allied. These divisions may consist of several quarters, as these divisions are termed; an extraordinary instance of which was exhibited at the funeral of the Viscountess Townshend, whose corpse was brought from Dublin Castle to Raynham-Hall in Norfolk; when one of the principal tenants on horseback carried before the hearse a banner, containing the quarterings, to the amount of upwards of 160. But Sir William Dugdale justly objects to so many arms being clustered together in one shield or banner, on account of the difficulty of knowing and distinguishing one coat from another.

4. *Of the differences of Coats of Arms.*

There are also various differences or characteristic marks, by which bearers of the same arms may be distinguished from one another, and their nearness to the principal bearer demonstrated; and these differences are to be considered as either ancient or modern.

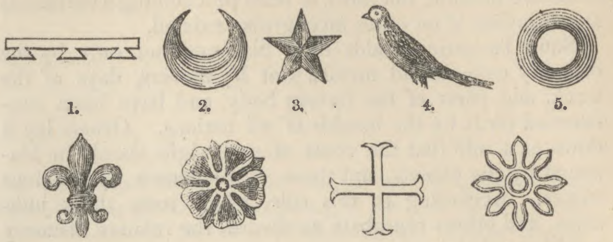
Of Ancient Differences.—Those which are called *ancient differences* consist in *bordures*,[1] which is a bearing that goes all round, and parallel to the boundary of the escutcheon. Bordures were used in ancient times also for noting a diversity between particular persons descended of one family and from the same parents. This distinction, however, was not expressly signified by invariable marks; nor were bordures always appropriated to denote the different degrees of consanguinity.





There are bordures of different forms and tinctures, as, for example,—1. Sable, a bordure argent. When a bordure is plain, it is not necessary to mention it, as it is always so understood in heraldry, though it be not expressed; but if it has any other form, this must be signified. 2. Gules, a bordure engrailed argent in the arms of Lord Gray. This is called *engrailed*, from the French word *engrêlé*, which signifies a thing the hail has fallen upon and broken off the edges, leaving it with little semicircles struck out of it. In a bordure or ordinary formed of these lines, the points are represented on all sides towards the field, and the semicircles are turned towards the bordure or ordinary. 3. Gules, a bordure invected or. This is quite contrary to the last, which turns its points into the bordure from the field. The word *indented* requires little explanation, the signification being obvious, from its figure, which is composed of tracks resembling teeth, called in Latin *dentes*. 4. Ermine, a bordure compony, or gobony, or and sable. This is so termed from its being composed of equal pieces of one row. Counter-compony is composed of two rows, and no more. Checky has a great resemblance to the last bordure, having three rows. Before blazoning, therefore, care must be taken to number them, so as to avoid taking the one for the other. 5. Gules, a bordure argent, charged with eight trefoils slipped proper, that is, vert. 6. Azure, a bordure quarterly ermine and checky argent and azure.

Of Modern Differences.—The modern differences which the English have adopted, not only for distinguishing sons issued out of one family but also for denoting the difference and subordinate degrees in each house from the original ancestors, are nine,—viz., for the heir or first son, the label; second son, the crescent; third son, the mullet; fourth son, the martlet; fifth son, the annulet; sixth son, the fleur-de-lys; seventh son, the rose; eighth son, the cross-moline; ninth son, the double quatre-foil. By the first six differences the sons of Thomas Beauchamp, the fifteenth Earl of Warwick, who died in the thirty-fourth year of the reign of Edward III., are distinguished in an old window of the church of St Mary at Warwick; so that although they are called *modern differences*, their usage among the English is ancient.



As to the distinction to be made in the arms of the offspring belonging to each of the above-mentioned brothers, it is expressed by certain figures. For instance, the heir or first son of the second house bears a crescent charged with a label during his father's lifetime only; the second son of the second house, a crescent charged with another crescent; the third son of the second house, a crescent charged with a mullet; the fourth son of the second house, a crescent charged with a martlet; the fifth son of the second house, a crescent charged with an annulet; the sixth son of the second house, a crescent charged with a fleur-de-lys; and so on of the other sons, taking care to have them of a different tincture.

It would be quite impossible to carry out this system in all the ramifications of a family of many generations from any common ancestor. At best, they can only be used for contemporary members of any branch from the original stock. When Dugdale, in his visitations, found a good house descending from a common parent stock, he used to distinguish the junior line by some significant mark, such as a cantor or other bearing.

The present marks of cadency are not earlier than the time of Henry VI. In the first stages of heraldry the distinctions between sons of the same family were of a more definite character; such as an entirely different coat, or the original one differenced by change of tincture, or by the addition of some other charges.

It must be observed, that of all the above-mentioned marks of distinction, none but the label is used for distinguishing the younger sons of the royal family; and this label is varied by additional pendants and distinct charges. The Prince of Wales always bears the plain label argent. The daughters of the blood royal all bear the label of distinction the same. The theory of this practice of differencing the arms of the royal children is, that none of the children of the sovereign is entitled to arms by descent, as the arms of their father are those of the state. When the sons and daughters of the reigning monarch receive permission to use the royal arms, they are assigned to them differenced by a label, charged with some distinguishing mark. This rule was observed in very early times under the Plantagenets, whose arms, so distinguished, are frequently to be found in churches and upon their seals.

---

[1] Bordures are still introduced into English coats of arms, but for particular reasons, which heralds can best explain. The bordure wavy is now the general bordure used to denote illegitimacy. Bordures are, by the French, frequently taken for principal figures, and numbered amongst the rest of the ordinaries.

III.—OF THE CHARGES.

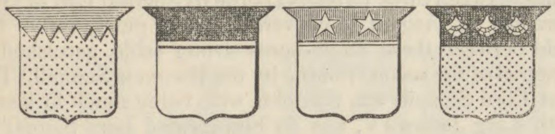
A charge is whatsoever is contained in the field, whether it occupy the whole or only a part thereof. All charges are distinguished by the names of *honourable ordinaries*, *subordinaries*, and *common charges.*

Honourable ordinaries, the principal charges in heraldry, are made of lines only, which, according to their disposition and form, receive different names. Sub-ordinaries are ancient heraldic figures, frequently used in coats of arms, and distinguished by terms appropriate to each. Common charges are composed of natural, artificial, and even chimerical objects or figures.

1. *Of Honourable Ordinaries.*

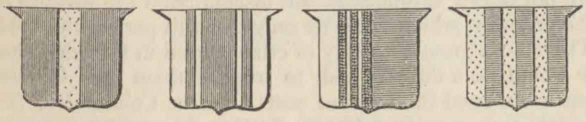
These are the chief, the pale, the bend, the bend sinister, the fess, the bar, the cheveron, the cross, and the saltier.

Of the Chief.—The chief is an ordinary determined by an horizontal line, which, if it be of any other form than straight, must be expressed. It is placed in the upper part of the escutcheon, and contains in depth the third part of the field. Its diminutive is a fillet, the content of which is not to exceed one fourth of the chief, and it stands in the lowest part of the chief. This ordinary is subject to be charged with variety of figures; and may be of any of the crooked lines.

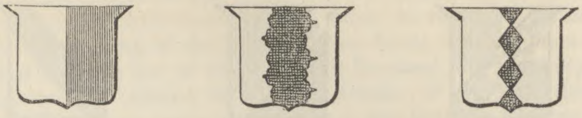


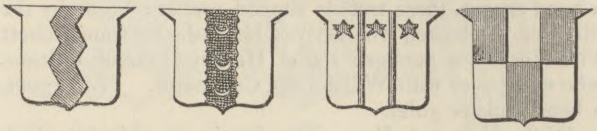
Examples:—1. Or, a chief intented azure; borne by Viscount Mountgarret. The family of the Butlers is descended from the ancient Counts of Brion in Normandy; but since Henry II. conferred the office of chief butler of Ireland upon one of the family, he and his successors have assumed the name of Butler. 2. Argent, a chief sable; in the lower part thereof a fillet of the field. 3. Argent, on a chief gules, two mullets or; borne by Lord St John of Bletshoe. This ancient family derive their surname from a place called St John in Normandy. 4. Or, on a chief sable, three escalops of the field, for the name of Graham; and borne quartered in the arms of the Duke of Montrose.

Of the Pale.—The pale is an ordinary, consisting of two perpendicular lines drawn from the top to the base of the escutcheon, and contains the third middle part of the field. Its diminutive is the pallet. This ordinary may receive any charge. The pale is sometimes cotised, or accompanied by its diminutives, to which some have given the term of *endorse.*

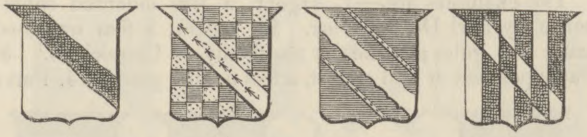


The following are examples:—1. Gules, a pale or. 2. Argent, a pale between two endorses, gules. 3. Party per pale.—1*st*, paly of six argent and sable; 2*d*, azure; borne by the name of Trenchard. 4. Pale of six or and azure. 5. Party per pale, argent and gules; borne by Earl Waldegrave. 6. Argent, a pale flory counter-flory sable. 7. Argent, a pale lozengy sable. 8. Argent, a pale dancette vert. 9. Argent, on a pale engrailed sable, three crescents or. 10. Argent, two endorses gules, in chief three mullets sable. 11. Party per fess gules and argent, a pale counterchanged.

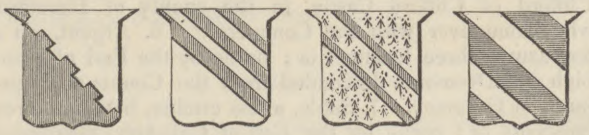




Of the Bend and Bend Sinister.—The bend is an ordinary formed by two diagonal lines, drawn from the dexter chief to the sinister base, and contains the fifth part of the field in breadth. Its diminutives are—the bendlet, which is the half of a bend; the cost or cotise, when two of them accompany a bend, which is the fourth part of a bend. There is also the bend sinister, which is of the same breadth as the bend, but drawn the contrary way. This is subdivided into a scarpe, which is the half of the bend, and into a baton, which is the fourth part of the bend, but does not extend itself to the extremities of the field, there being part of it seen at both ends.



The examples are,—1. Argent, a bend wavy sable; borne by Wallop Earl of Portsmouth, descended from a Saxon family, who were possessed of lands to a considerable value in Hampshire at the time of the Conquest. 2. Checky or, and azure, a bend ermine; borne by Lord Ward. 3. Azure, a bend engrailed argent, between two cotises or; borne by Earl Fortescue.[1] 4. Paly of six or and sable, a bend counterchanged. 5. Party per bend crenelle argent and gules; borne by the Earl of Cork and Orrery, in Ireland. 6. Argent, three bendlets, enhanced gules (as the English express it, though the phrase enhanced is used by no other nation); borne by Lord Byron.[2] 7. Ermine, a bend voided gules;—Ireton. 8. Bendy of six pieces argent and azure. When the shield is filled with an equal number of bendlets of metal and colour, it is called

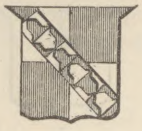


---

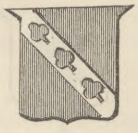
[1] The family of Fortescue is descended from Sir Richard le Forte, a person of extraordinary strength and courage, who accompanied William Duke of Normandy in his invasion of England; and bearing a strong shield before the duke, at the battle of Hastings, had three horses killed under him, and from that signal event the name and motto of the family were assumed; for the Latin word *scutum*, or the old French word *escue*, a shield, being added to *forte*, strong, composes their name; and their motto is, *Forte scutum salus ducum.*

[2] From Doomsday Book it appears that this family was possessed of numerous manors and lands in the reign of the Conqueror; and that Sir John Byron attended King Edward III. in his wars in France.

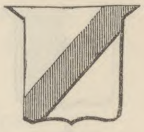
bendy; but if the number of them be unequal, they are to be blazoned by the name *bendlets*, and their number specified. 9. Quarterly, or and gules, a bend over all vair; was borne by the Dukes of Dorset (now extinct). 10. Gules on a bend argent, three trefoils slipped proper; borne by the Marquis of Bristol, who derives his pedigree from Robert Fitz-Hervey, a younger son of Hervey Duke of Orleans, who came over with William the Conqueror. 11. Argent, a bend sinister gules.



9.

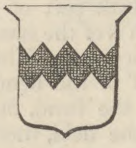


10.

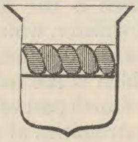


11.

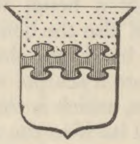
Of the Fess and Bar.—The fess is an ordinary which is produced by two parallel lines drawn horizontally across the centre of the field, and contains in breadth the third part thereof. The bar is formed of two lines, and contains only the fifth part of the field; but this is not the only respect in which it differs from the fess; for there may be more than one in an escutcheon, placed in different parts of it, whereas the fess is limited to the centre point. When the shield contains a number of bars of metal and colour alternate, of even number, that is called *barry* of so many pieces, expressing their number.



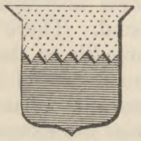
1.



2.

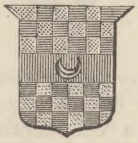


3.

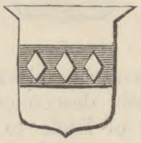


4.

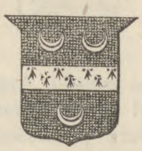
The examples are,—1. Argent, a fess indented sable; borne by Earl De La Warr. 2. Argent, a fess wreathed azure and gules; borne by the family of Carmichael.[1] 3. Party per fess or and argent, a fess nebule gules. 4. Party per fess indented or and azure. 5. Checky or and azure on a fess gules, a crescent argent for difference; borne by Lord Clifford of Chudleigh, descended from Walter de Clifford of Clifford Castle, in the county of Hereford, who came over with the Conqueror.[2] 6. Argent, on a fess azure, three lozenges or; borne by the Earl of Denbigh and Desmond, descended from the Counts of Hapsburg, in Germany. 7. Sable, a fess ermine, between three crescents or; borne by the Earl of Coventry, descended from John Coventry, a native of the city of Coventry, and afterwards mercer and Lord Mayor of London in the reign of Henry V. 8. Or, two bars azure, a chief quarterly of the second and gules, the first and fourth charged with two fleurs-de-lys of France, the second and third with a lion of England; borne by the Duke of Rutland. 9. Barry of ten pieces argent and azure, over all six escutcheons 3, 2, 1, sable, each charged with a lion rampant of the first, armed, and langued gules; borne by the Marquis of Salisbury, descended from the famous William Cecil Lord Burghley, who left two sons, Thomas and Robert, both of whom were made Earls in one day; Robert, the younger, being created Earl of Salisbury in the morning; and Thomas, the elder, Earl of Exeter in the afternoon. 10. Ermine, two bars gules; borne by the Marquis of Westmeath. 11. Argent, two bars indented sable; formerly borne by the Earls of Athlone (now extinct).[3] 12. Argent, three bars gemelles gules; formerly borne by the Earls of Barrymore (now extinct).



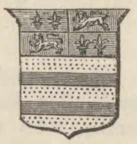
5.



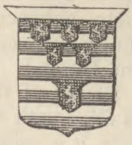
6.



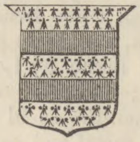
7.



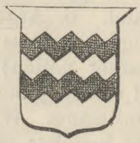
8.



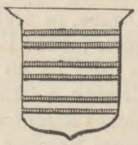
9.



10.

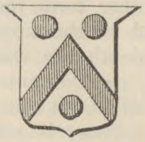


11.

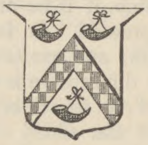


12.

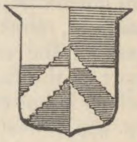
Of the Cheveron.—The cheveron, which represents two rafters of a house well joined together, or a pair of compasses half open, occupies the fifth part of a field. Its diminutive, the cheveronel, contains the half of a cheveron.



1.

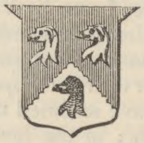


2.

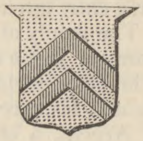


3.

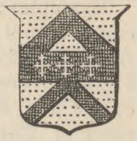
The examples of cheverons are,—1. Argent, a cheveron gules between three torteaux; borne by Sherard Earl of Harborough. 2. Argent, a cheveron checky gules, and of the field between three bugle-horns strung sable, garnished or stringed of the second; borne by the Baroness Sempill. The first Lord Sempill was Sir John, who, being much in favour with King James IV. was by him created Lord Sempill in 1489. 3. Quarterly argent and azure, a cheveron engrailed counter-changed. 4. Party per cheveron engrailed gules and argent, three talbots' heads erased counter-changed; borne by Lord Feversham, descended from the Duncombes of Ivinghoe in Buckinghamshire. 5. Or, two cheveronels gules; borne by Lord Monson, descended from John Monson, who flourished in the reign of King Edward III. 6. Or, on a fess, between two cheveronels sable, three cross-croslets of the first; borne by the Earl of Orford. This family took their name from Walpole in Norfolk, where they resided before the Conquest.



4.



5.



6.

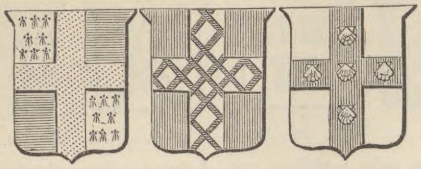
Of the Cross.—The *cross* is an ordinary formed by the meeting of two perpendicular with two horizontal lines in the fess-point, where they make four right angles; the lines are not drawn throughout, but discontinued the breadth of the ordinary, which takes up only the fifth part of the field. There is so great a variety of crosses used in heraldry, that it would be a difficult task to treat of them all. Guillim has mentioned 39 different sorts; De la Columbière, 72; Leigh, forty-six; and Upton declares he cannot ascertain all the various crosses borne in arms, as they are almost innumerable. As their different forms cannot be given here, we shall, therefore, only take notice of such as are most commonly seen at present in coats-of-arms.

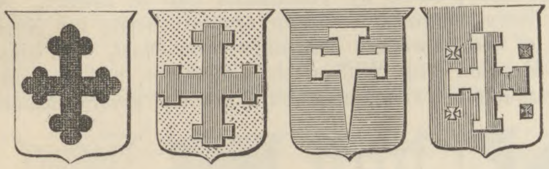
---

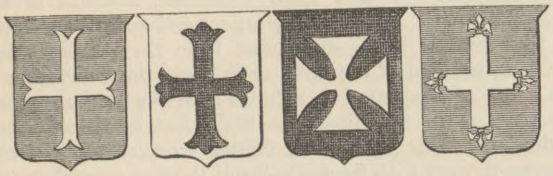
[1] Of this ancient family, see an interesting account, vol. i., p. 752 of Douglas's *Peerage*, 2d ed., 1813.

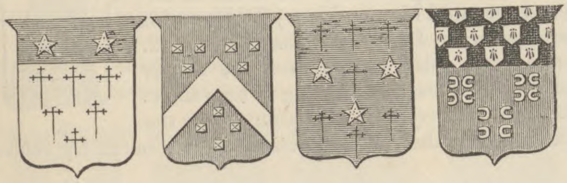
[2] Fair Rosamond, mistress to Henry II., was of this family.

[3] Godart, the first earl, was descended of an ancient family in the United Provinces of Holland, where he was Baron de Reede de Ginkel. In 1691, he was a lieutenant-general of King William's forces in Ireland, where, in June the same year, he took Ballymore for the English, and, in July following, the town of Athlone.



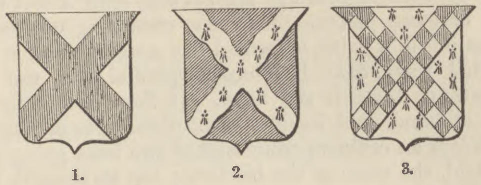


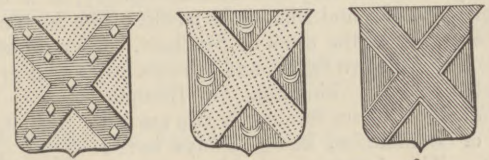


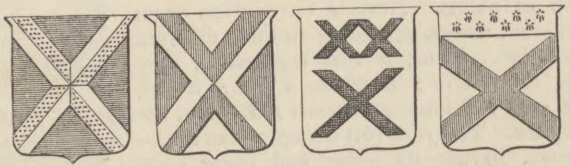


The first is quarterly, ermine and azure, a cross or; borne by the Duke of Leeds. 2. Gules, a cross argent fretty azure; borne by Viscount Taaffe of Corran, in Ireland. 3. Argent, on a cross gules, five escalops or; borne by the Earl of Jersey, descended from the family of Villiers in Normandy, some of whom came over to England with the Conoueror 4. Argent, a cross bottony sable. 5. Or, a cross croslet gules. 6. Azure, a cross potent fitchy argent. This ensign is said to have been borne by Ethelred, king of the West Saxons. 7. Party per pale, gules and argent; a cross potent quadrate in the centre, between four crosses patée, all counter-changed; the arms of the episcopal see of Lichfield and Coventry. 8. Azure, a cross moline argent; borne by Bentinck Duke of Portland, descended from a family in the United Provinces of Holland, of which was William Bentinck, who in his youth was page of honour to the Prince of Orange, afterwards William III. king of Great Britain, and, on the accession of William and his consort, was made groom of the stole, lieutenant-general of his majesty's army, and created Baron of Cirencester, Viscount Woodstock, and Earl of Portland, in 1689. 9. Argent, a cross patonce sable. 10. Sable, a cross patée argent. 11. Azure, a cross flory argent. This is said to have also been the arms of Edwin, the first Christian king of Northumberland. 12. Argent, six cross-croslets fitchée, 3, 2, 1, sable, on a chief azure two mullets or; borne by Clinton Duke of Newcastle. 13. Gules, a cheveron between ten crosses patée, six in chief and four in base, argent; borne by the Earl of Berkeley, descended from Robert Fitz-Hardinge, who obtained from Henry II. a grant of Berkeley Castle in Gloucestershire, which the family still inherits, and whence they obtained the surname of Berkeley. 14. Azure, three mullets or, accompanied with seven cross-croslets fitchée, argent, three in chief, one in fess, two in flanks, and the last in base; borne by Lord Somerville. 15. Gules, three crosses recercelée, voided or, a chief vairy ermine and contre ermine; borne by Baron Willoughby de Broke.

Of the Saltier.—The saltier, which is formed by the bend and bend sinister crossing each other in right angles, as the intersecting of the pale and fess forms the cross, contains the fifth part of the field. In Scotland, this ordinary is frequently called a St Andrew's Cross. It may, like the others, be borne engrailed, wavy, &c., also between charges, or charged with any thing.



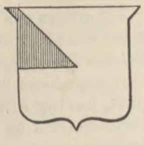




The examples are,—1. Argent, a saltier gules; borne by the Duke of Leinster, descended from Otho, or Other, a powerful lord in the time of King Alfred. 2. Purpure, a saltier, wavy ermine. 3. Ermine, a saltier, counter-compony argent and gules. 4. Or, on a saltier azure, nine lozenges of the first; the paternal arms of Dalrymple Earl of Stair. 5. Gules, a saltier between four crescents or; borne as the second and third quarters in the coat-of-arms of Lord Kinnaird. 6. Gules, a saltier vert fimbriated or. 7. Azure, a saltier quarterly quartered or and argent; the arms of the episcopal see of Bath and Wells. 8. Party per saltier argent and gules, a saltier counter-changed; borne by Sir Claude Scott. 9. Argent, three saltiers couped sable. 10. Argent, a saltier gules, and a chief ermine; quartered by Fitz-Maurice Marquis of Lansdowne, &c. This family is a branch of that of Leinster.

2. *Of Sub-Ordinaries.*

Besides the honourable ordinaries and the diminutions already mentioned, there are other heraldic figures, called *sub-ordinaries*, which, by reason of their ancient use in arms, are of worthy bearing; namely, the gyron, quarter, canton, fret, pile, orle, inescutcheon, tressure, annulet, flanches, billet, lozenge, guttes, fusil, rustre, mascle, papillone, and diaper.



The *gyron* (1.), is a triangular figure formed by two lines, one drawn diagonally from one of the four angles to the centre of the shield, and the other is drawn either horizontal or perpendicular, from one of the sides of the shield, meeting the other line at the centre of the field. *Gyronny* is said, when the field is covered with six, eight, ten, or twelve gyrons in a coat-of-arms; but a French author contends that the true gyronny consists of eight pieces only. The *quarter* is a square figure, which occupies the upper dexter quarter of the shield, but is rarely carried as a charge. The *canton* (2.) is a square part of the escutcheon, somewhat less than the quarter, but without any fixed proportion, and possesses the dexter-chief point of the shield; but should it possess the sinister corner, which seldom occurs, it must be blazoned a canton sinister. The *fret* is a figure representing a saltier, with a mascle in the centre interlaced. *Fretty* is said when the field or bearings are covered with a fret of six, eight, or more pieces. The *pile*, consisting of two lines terminating in a point, is formed like a wedge, and is borne engrailed, wavy, &c. It issues in general from the chief, and extends towards the base; yet there are some piles borne in bend, and issuing from other parts of the field. The *orle* is an ordinary composed of two lines going round the shield, the same as the bordure; but its breadth is but one-half of the latter, and at some distance from the edge of the shield. The *inescutcheon* is a little escutcheon borne within the shield. The *tressure* is an ordinary commonly supposed to be the half of the breadth of an orle, and is generally borne flowery and counter-flowery, as it is also very often double, and sometimes treble. The double tressure forms part of the arms of Scotland. The *annulet*, or ring, is a well-known figure, and is frequently found in arms throughout every kingdom of Europe. The *flanches* (3.) are formed by two curved lines, or semicircles, being always borne double. The *billet* is an oblong square figure, twice as long as broad. The *lozenge* (4.) is an ordinary of four equal and parallel sides, but not rectangular; the upper and lower angles being acute, and the other two obtuse. *Guttes*, or drops, are round at bottom, waved on the sides, and terminate at the top in points. Heralds have given them different names, according to their different tinctures. Thus, if they are yellow, they are called *d'or;* if white, *d'eau;* if red, *de sang;* if blue, *de larmes;* if green, *de vert;* if black, *de poix.* The *fusil* (5.) is longer than the lozenge, having its upper and lower parts more acute than the other two collateral middle parts, which acuteness is occasioned by the short distance of the space between the two collateral angles; and this space, if the fusil be rightly made, is always shorter than any of the four equal geometrical lines of which it is composed. The *rustre* (6.) is a lozenge pierced round in the middle. The *mascle* (7.) is pretty much like a lozenge, but voided or perforated throughout its whole extent, showing a narrow border.[1] *Papillone* is an expression used for a field or charge that is covered with figures like the scales of a fish. *Diapering* is said of a field or charge shadowed with flourishings or foliage, with a colour a little darker than that on which it is wrought. The Germans frequently use it; but it does not enter into the blazoning or description of arms, and only serves to embellish the coat.

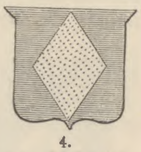
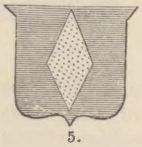
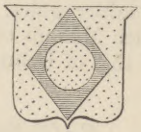
3.



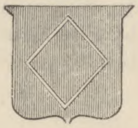
4.



5.



6.



7.

The following are examples of sub-ordinaries,—viz., 1 Gules, an orle ermine. 2. Argent, three inescutcheons gules; borne as the second and third quarters in the coat of Hay, Earl of Kinnoul. The first of the name of Hay who bore these arms obtained them because he and his two sons, after having defeated a party of the Danes at the battle of Loncarty in the year 942, were brought to the king with their shields all stained with blood. 3. Argent, a fret sable; borne by Tollemache Earl of Dysart. 4. Or, fretty of gules, a canton ermine; borne by Noel, Earl of Gainsborough, descended from Noel, who came into England with William the Conqueror, and, in consideration of services, obtained a grant of several manors and lands. 5. Gironny of eight pieces or and sable; the first and fourth quarters of the coat-of-arms of Campbell, Marquis of Breadalbane, descended in regular succession from Duncan, the first Lord Campbell, ancestor of the Dukes of Argyll. 6. Lozengy argent and gules; quartered by Earl Fitz-William, descended from Sir William Fitz-William, marshal of the army of William the Conqueror at the battle of Hastings. 7. Sable, a mascle within a tressure flowery argent. 8. Gules, three mullets or, within a bordure of the latter, charged with a double tressure flowery, and counter-flowery with fleurs-de-lys of the first; quartered by the Duke of Sutherland, &c. This family is amongst the oldest in Britain, if not in Europe; the title of earl having been conferred on one of their ancestors in 1067. 9. Azure, a pile ermine. 10. Or, on a pile engrailed azure, three cross-croslets fitchy of the first. 11. Or, on a pile gules, between six fleurs-de-lys azure, three lions of England; the first and fourth quarters of the Duke of Somerset, granted him by Henry VIII. on his marriage with Lady Jane Seymour. 12. Ermine, two piles issuing from the dexter and sinister sides, and meeting in base sable. 13. Argent, three piles, one issuing from the chief between the others reversed, sable; borne by Hulse.

3. *Of Common Charges borne in Arms.*

In all ages men have made use of the representation of living creatures, and other symbolical signs, to distinguish themselves in war; and these marks, which were promiscuously used as hieroglyphics, emblems, and personal devices, were soon received into heraldry. But nothing shows the extent of human ingenuity more than the great variety of these marks of distinction, since they are composed of all sorts of figures, some natural, others artificial, and many chimerical.

---

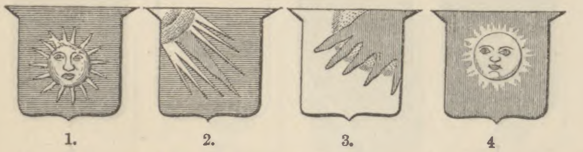
[1] Authors are divided about the resemblance of a mascle, some taking it for the mash of a net, and others for the spots of certain flints found about Rohan; and as no writer has given a clearer account in support of this last opinion than Colombier, author of *La Science Héraldique*, we shall transcribe it for the satisfaction of the curious. "Rohan," says he, "bears gules, nine mascles, or, 3, 3, 3. Opinions have varied very much about the origin of the mascles or mashes, as being somewhat like the meshes of nets; but for my own part, having often observed that those things which are remarkable and singular in some countries, have sometimes occasioned the lords thereof to represent them in their escutcheons, and to take them for their arms, I am of opinion, that the lords of Rohan, who, I believe, are the first that bore those figures in their arms, though descended from the ancient kings and princes of Bretagne, took them, because in the most ancient viscounty of Rohan, afterwards erected into a duchy, there are abundance of small flints, which being cut in two, this figure appears on the inside of them; as also the carps, which are in the fish-ponds of that duchy, have the same mark upon their scales; which, being very extraordinary, and peculiar to that country, the ancient lords of the same had good reason,

Thus, the family of Rabett bears three rabbits heads; that of Lucy, three luces or pikes, in Latin *tres lucios pisces;* that of Starkey, a stork; and that of Shuttleworth, three weavers' shuttles.

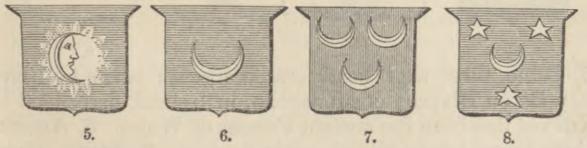
Besides these natural and artificial figures, there are chimerical or imaginary ones used in heraldry, the result of fancy and caprice; such as centaurs, hydras, phœnixes, griffons, hippogriffs, and dragons. This great variety of figures shows the impossibility of comprehending all common charges in a work of this nature; such only shall be treated of as are therefore most frequently borne.

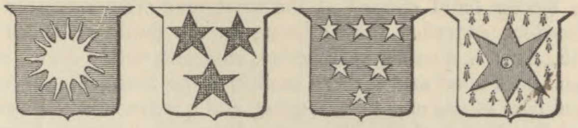
Art. 1.—*Of Natural Figures borne in Arms.*

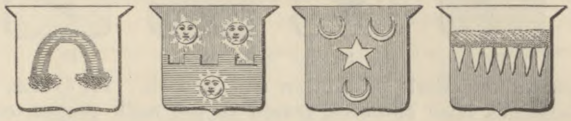
Amongst the multitude of natural things which are used in coats of arms, those most usually borne are, for the sake of brevity as well as perspicuity, distributed into the following classes:—viz., *Celestial figures*, as the sun, moon, stars, &c., and their parts; *effigies* of men, women, &c., and their parts; *beasts*, as lions, stags, foxes, boars, &c., and their parts; *birds*, as eagles, swans, storks, pelicans, &c., and their parts; *fishes*, as dolphins, whales, sturgeons, trouts, &c., and their parts; *reptiles* and *insects*, as tortoises, serpents, grasshoppers, &c., and their parts; *vegetables*, as trees, plants, flowers, herbs, &c., and their parts; *stones*, as diamonds, rubies, pebbles, rocks, and the like. These charges have, as well as ordinaries, various attributes or epithets, which express their qualities, positions, and dispositions. Thus the sun is said to be *in his glory*, *eclipsed*, and the moon *in her complement*, *increscent;* animals are said to be *rampant*, *passant;* birds have also their denominations, such as *close*, *displayed;* and fishes are described to be *hauriant*, *naiant*, and so forth.



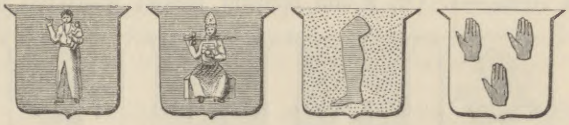
1*st.* *Examples of Celestial Figures.*—1. Azure, a sun in his glory; born in the first and fourth quarters of the coat of arms of the Marquis of Lothian. 2. Azure, one ray of the sun bendways gules, between six beams of that luminary argent. 3. Argent, five rays of the sun issuing out of the sinister corner gules. 4. Gules, the moon in her complement, illustrated with all her light proper. This is sufficient without naming the colour, which is argent. 5. Azure, a moon decrescent proper. 6. Azure, a crescent argent. This bearing is also used as a difference, being assigned to the second son, as before mentioned. 7. Gules, three crescents argent; borne by the family of Oliphant. 8. Azure, a crescent between three mullets argent; borne by Arbuthnott, Viscount and Baron Arbuthnott. 9. Azure, a star of sixteen points argent. 10. Argent, three mullets sable; borne by the name of Wollaston. 11. Azure, six mullets, 3, 2, 1, or; borne by the name of Welch. 12. Ermine, a mullet of six points pierced gules. 13. Argent, a rainbow with a cloud at each end proper. This is part of the crest to the Earl of Hopetoun's coat of arms. The whole of it is a globe split on the top, and above it is the rainbow and clouds. 14. Party per fess crenelle gules and azure, three suns proper. 15. Gules, a mullet between three crescents argent. 16. Gules, a chief argent, on the lower part thereof a cloud, the sun's resplendent rays issuing throughout proper; borne by Leeson Earl of Miltown.

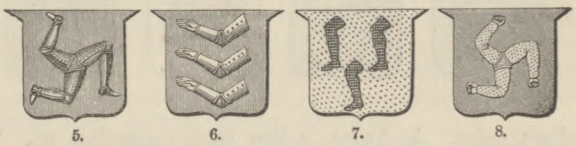


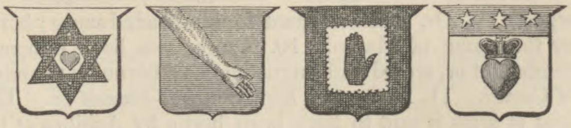




2*d. Examples of Effigies of Men, &c., and their Parts.*—1. Azure, the Virgin Mary crowned, with her babe in her right arm and a sceptre in her left, all or, the coat of arms of the bishopric of Salisbury. 2. Azure, a presbyter sitting on a tombstone, in his left hand a mound, his right hand extended, all or, with a linen mitre on his head, and a sword in his mouth, all proper; the coat of arms of the bishopric of Chichester. 3. Or, a man's leg couped at the midst of the thigh azure. 4. Argent, three sinister hands couped at the wrist, and erect gules. 5. Gules, three legs armed proper, conjoined in the fess point at the upper part of the thighs, flexed in triangles, garnished and spurred, or. This is the coat of arms of the Isle of Man; and is quartered by the Dukes of Atholl, formerly titular lords or kings of that island. 6. Gules, three dexter arms vambraced fessways, in pale proper; borne by several branches of the Armstrong family. 7. Or, three legs couped above the knee sable. 8. Vert, three dexter arms conjoined at the shoulders in the fess point, and flexed in triangle or, with fists clenched argent; borne by the family of Tremayne. 9. Argent, a man's heart gules, with two equilateral triangles interlaced sable. 10. Azure, a sinister arm, issuing out of the dexter-chief,



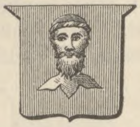




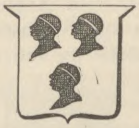
---

upon observing that wonder, to take those figures for their arms, and to transmit them to their posterity, giving them the name of *macles*, from the Latin word *macula*, signifying a spot; whence some of that house have taken for their motto, *Sine macula macla*, that is, a mascle without a spot."

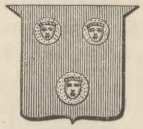
and extended towards the sinister base argent. 11. Argent, a dexter hand couped at the wrist, and erected, within a bordure engrailed sable; borne by the family of Manley. 12. Argent, a man's heart gules, ensigned with a crown or, and on a chief azure, three mullets of the first. The paternal coat of the name of Douglas, and quartered in the arms of the Duke of Hamilton, the Marquis of Queensberry, and of the Earls of Morton and Selkirk. 13. Gules, a Saracen's head affrontée, erased at the neck proper, environed about the temples with a wreath of the argent and sable; borne by Mostyn Lord Mostyn. 14. Argent, three blackamoors' heads couped proper, banded about the head, argent and gules. 15. Gules, three bezants, each charged with a man's face affrontée proper. 16. Or, a blackamoor's head couped proper, banded about the head argent.



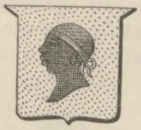
13.



14.



15.



16.

When half of the face, or little more, of human figures, is seen in a field, it is then said to be *in profile;* and when the head of a man, woman, or other animal, is represented with a full face, it is termed *affrontée.*

3*d. Examples of the different Positions of Lions, &c., in Arms.*—1. Or, a lion rampant azure; quartered by Percy Duke of Northumberland. 2. Azure, a lion rampant-guardant or. 3. Gules, a lion rampant-reguardant or; quartered by Cadogan Earl Cadogan. 4. Argent, a lion saliant gules. 5. Azure, a lion statant-guardant or. 6. Azure, a lion passant or, between three fleurs-de-lys argent. 7. Argent, a lion passant guardant gules crowned or; quartered by Ogilvie Earl of Seafield. 8. Gules, a lion sejant argent. 9. Or, a lion rampant double-headed azure; borne by the name of Mason. 10. Azure, two lions rampant-combatant or, armed and langued gules; borne by the name of Carter. 11. Azure, two lions rampant-adossés or. This coat of arms is said to have been borne by Achilles at the siege of Troy. 12. Sable, two lioncels counter-passant argent, the uppermost towards the sinister side of the escutcheon, both collared gules; borne by the name of Glegg.[1] 13. Argent, a demi-lion rampant sable. 14. Gules, a lion couchant between six cross-croslets, three in chief, and as many in base, argent; for the name of Tynte. 15. Azure, a lion dormant or. 16. Or, out of the midst of a fess sable, a lion rampant naissant gules.[2] 17. Azure, three lions rampant or; borne by Fiennes Baron Saye and Sele. 18. Gules, a tri-corporated lion issuing from three parts of the escutcheon, all meeting under one head in the fess point or, langued and armed azure. 19. Gules, a bezant between three demi-lions rampant argent; borne by Bennet Earl of Tankerville.

It is to be observed that, if a lion, or any other beast, be represented with its limbs and body separated, so that they remain upon the field at a small distance from their natural places, it is then termed *Dehaché*, or *couped in all its parts;* of which remarkable bearing there is an instance in armory, namely, or, a lion rampant gules, dehaché, or couped in all its parts, within a double tressure flowery and counter-flowery of the second; borne by the name of Maitland.

4*th. Examples of other Quadrupeds and their parts, borne in Coats of Arms.*—1. Sable, a camel statant argent. 2. Gules, an elephant statant argent, tusked or. 3. Argent a boar statant gules, armed or. 4. Sable, a bull passant or. 5. Sable, three nags' heads erased argent; borne by Blayney Baron Blayney of Monaghan, in Ireland, descended in a direct line from the ancient Princes of Wales. 6. Argent, three boars' heads erased, erect proper. 7. Argent, three bulls' heads erased, sable, armed or; quartered by Skeffington Viscount Massareene. 8. Argent, two foxes counter-

[1] Some fanciful heralds say it is the natural disposition of the lion not to bear a rival in the field; therefore two lions cannot be borne in one coat of arms, but must be supposed to be lions' whelps, called *lioncels;* except when they are parted by an ordinary, or so disposed that they seem to be distinctly separated from each other. In the two preceding examples they are called *lions*, because in the 10th they seem to be striving for the sovereignty of the field, which they would not do unless they were of full growth; and in the 11th they are supposed to represent two valiant men, whose dispute being accommodated by the prince, are leaving the field, their pride not suffering them to go both one way.

[2] This form of blazon is peculiar to all living things which are found issuing out of the midst of some ordinary or other charge.

saliant, the dexter surmounted of the sinister gules; for the name of Kadrod Hardd, an ancient British family, from which are descended the Williams-Wynns, who bear these quartered, second and third, for Williams. 9. Argent, three bulls passant sable, armed and ungulled or; for Ashley, and quartered by Ashley Cooper Earl of Shaftesbury, descended from Richard Cooper, who flourished in the reign of Henry VIII. 10. Gules, three lions gambs erased argent; for the name of Newdegate. 11. Azure, a buck's head cabossed argent; borne by Legge Earl of Dartmouth. 12. Argent, two squirrels sejant adossée gules. 13. Gules, a goat passant argent. 14. Sable, a stag standing at gaze argent. 15. Azure, three holy lambs or.

5th. Examples of Birds, Fishes, Reptiles, &c.—1. Ermine, an eagle displayed gules; borne by Sir Henry Bedingfield. 2. Gules, a swan close proper. 3. Gules, a pelican in her nest with wings elevated, feeding her young ones or, vulned proper; borne by the name of Carne. 4. Argent, three peacocks in their pride proper. 5. Or, a raven proper; borne by the name of Corbet. 6. Argent, three cocks gules, crested and jow-lopped sable, a crescent surmounted of a crescent for difference; formerly borne by the Cockaynes Viscounts Cullen, of Donegal in Ireland (now extinct). 7. Sable, a dolphin naiant embowed or; borne by the name of Symonds. This animal was in former times borne by the eldest son of the French kings, as next heirs to the crown, no other subject in that kingdom being permitted to bear it. 8. Argent, three whales' heads erect and erased sable; borne by the name of Whalley. 9. Gules, three escalops argent; borne by Keppel Earl of Albemarle, descended from Arnold Joost van Keppel, lord of Voorst, Holland, who came into England in 1688, with the Prince of Orange, to whom he was then a page of honour, and was by him created a peer of England, by the title of Earl of Albemarle, from a town of that name in Normandy, 10th February 1696. 10. Azure, three bees, two and one, volant, argent. 11. Vert, a tortoise passant argent. 12. Gules, an adder nowed or.[1] 13. Ermine, a rose gules barbed and seeded proper; borne by Boscawen Viscount Falmouth, whose family have possessed the lands of Boscawen Rose, in the county of Cornwall, since the time of King John. 14. Azure, three laurel leaves slipped or; borne by the name of Leveson, and quartered by Granville-Sutherland-Leveson Gower, Duke of Sutherland, &c. 15. Azure, three garbs or; borne by the ancient Earls of Chester. 16. Gules, three cinquefoils argent; borne by Lambart Earl of Cavan, in Ireland. This ancient family is of French extraction.

It is to be observed, that trees and plants are sometimes said to be trunked, eradicated, fructuated, and raguled, according as they are represented in arms.

Art. 2.—*Of Artificial Figures borne in Arms.*

After the various productions of nature, artificial figures, the objects of art and mechanism, claim the next rank. They may be distributed into the following classes,—viz., *Warlike instruments*, as swords, arrows, battering-rams, gauntlets, helmets, spears, pole-axes; *ornaments* used in royal and religious ceremonies, as crowns, coronets, mitres, wreaths, crosiers; *architecture*, as towers, castles, arches, columns, plummets, battlements, churches, portcullises; *navigation*, as ships, anchors, rudders, pendants, sails, oars, masts, flags, galleys, lighters, and so on.

All these bearings have different epithets, serving to express their position, their disposition, or their form. Thus swords are said to be erect, pommeled, hilted; arrows, armed, feathered; towers, covered, embattled; and so of all others, as will more fully appear by the following examples:—1. Sable, three swords, their points meeting in the base argent, pommeled and hilted or; borne by Paulet Marquis of Winchester, descended from Hercules, Lord of

---

[1] Adders, snakes, and serpents, are said to represent many things, which being according to the fancy of the ancients, and a few modern authors who have adopted their opinions, it is needless to enlarge upon. It is certain they often occur in armory; but the noblest is that of the duchy of Milan, viz., "argent, a serpent gliding in pale azure, crowned or, vorant an infant issuing gules." The occasion of this bearing was as follows:—Otho, first Viscount of Milan, on his way to the Holy Land with Godfrey of Bouillon, defeated and slew in single combat the great giant Volux, a man of extraordinary stature and strength, who had challenged the bravest of the Christian army. The viscount having killed him, took his armour, and amongst it his helmet, the crest of which was a serpent swallowing an infant, worn by him to strike terror into those who should be so bold as to engage him.

Tournon in Picardy, who came to England with Jeffrey Plantagenet, Earl of Anjou, third son of King Henry II., and amongst other lands had the lordship of Paulet in Somersetshire conferred on him. 2. Argent, three battering-rams barways in pale, headed, azure and hooped or, borne by Bertie, Earl of Abingdon. 3. Azure, three left-hand gauntlets with their backs affrontée or; borne by Fane Earl of Westmoreland. 4. Gules, two helmets in chief proper, garnished or, in a base of a garb of the third; borne by Cholmondeley Marquis of Cholmondeley, an ancient family in Cheshire. 5. Argent, a ship with its sails furled up sable; quartered by Hamilton Marquis of Abercorn. The descent of this family is from that of the Duke of Hamilton. 6. Sable, three spears' heads erect argent, embrued gules, on a chief or, as many pole-axes reversed, azure; borne by King Earl of Lovelace. 7. Argent, a maunch sable; borne by Hastings Earl of Huntingdon, of a very ancient and noble family, of which was Walter de Hastings, steward to King Henry I. 8. Azure, a circular wreath argent and sable, with four hawks' bells joined thereto in quadrature or; borne by Jocelyn Earl of Roden. 9. Gules, two keys in saltier argent, in chief a royal crown proper; the arms of the archbishopric of York. 10. Gules, two swords in saltier argent, pommeled and hilted or; the arms of the bishopric of London. 11. Sable, a key in bend, surmounted by a crosier in bend sinister, both or; the arms of the bishopric of St Asaph. 12. Gules, two keys adossée in bend, the uppermost argent, the other or, a sword interposed between them in bend sinister of the second, pommeled, and hilted of the third; the arms of the bishopric of Winchester. 13. Gules, three mitres with their pendants or; the arms of the bishopric of Chester. 14. Sable, two crosiers, in saltier or, and argent; on a chief azure three mitres labelled of the second; the arms of the bishopric of Llandaff. 15. Gules, a sword erect in pale argent, pommeled and hilted or, surmounted by two keys in saltier of the last; the arms of the bishopric of Exeter. 16. Gules, three ducal coronets or; the arms of the bishopric of Ely.

ART. 3.—*Of Chimerical Figures.*

Are such as have no real existence, but are mere fabulous and fantastical inventions. These charges, griffons, martlets, and unicorns excepted, are so uncommon in British coats, that in order to make up the same number of examples hitherto contained in each collection, several foreign bearings are introduced; which, however, as they are conformable to the laws of heraldry, may also contribute to instruct the reader. Those most in use are the following,—namely, angels, cherubims, tritons, centaurs, martlets, griffons, unicorns, dragons, mermaids, satyrs, wiverns, harpies, cockatrices, and phœnixes.

These, like the foregoing charges, are subject to various positions and dispositions, which, from the principles already laid down, will be easily understood by the following examples:—1. Gules, an angel standing affrontée, with his hands conjoined and elevated upon his breast, habited in a long robe close girt argent, his wings displayed or; borne by Brangor de Cerevisia, a foreign prelate, who assisted at the council of Constance in 1412. 2. Sable, a cheveron between three cherubim or; borne by the name of Chaloner of Yorkshire. 3. Gules, a cherub having three pair of wings, the uppermost and lowermost counter-crossed saltierways, and the middlemost displayed argent; borne by the name of Buocasoco, a foreign prelate. This example is copied from Menestrier's *Méthod du Blason.* 4. Azure, a griffon segreant or, armed and langued gules, between three crescents argent; quartered by Bligh, Earl of Darnley. 5. Azure, three mullets argent within a double tressure counter-flowery or, in the centre a martlet of the last; borne by Murray Lord Elibank. The martlet is represented without feet, and is given for a difference to younger brothers, no doubt to remind them that, in order to raise themselves, they must trust to the wings of virtue and merit, and not to their legs, having but little land to set foot on. 6. Sable, a cockatrice displayed argent, crested, membered, and jowlopped gules. 7. Argent, a mermaid gules, crined or, holding in her right hand a mirror, and in her left a comb, both proper; borne by the Merioneth family of Ellis. 8. Argent a wivern, his wings elevated, and his tail nowed below him gules; borne by the family of Drake. 9. Or, a dragon passant vert. 10. Gules, a centaur or sagittary in full speed reguardant proper. This is said by some to have been the arms of Stephen of Blois, son of Adela, daughter of William the Conqueror, and of Stephen, Earl of Blois; who, grounding his pretension to the crown of England on this descent, was proclaimed king in 1135, and reigned till the 25th of October 1154. 11. Argent, an unicorn sejant sable, unguled and horned or. 12. Argent, a dragon's head erased

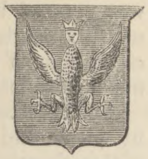
15.



16.

To the above-mentioned figures may be added the montegre, an imaginary creature, supposed to have the body of a tiger with the head and horns of a satyr; also those which have a real existence, but are said to be endowed with extravagant and imaginary qualities, as the salamander, beaver, cameleon, and others.

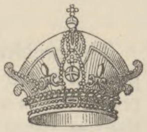
IV.—OF THE EXTERNAL ORNAMENTS OF ESCUTCHEONS.

Ornaments which accompany or surround escutcheons denote the dignity or office of the persons to whom the arms appertained, both amongst the laity and the clergy, consisting of crowns, coronets, mitres, helmets, mantlings, and supporters. Wreaths, crests, and scrolls, are common to all classes.

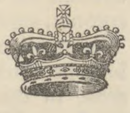
1. *Of Crowns.*

The first crowns were only diadems, bands, or fillets; but afterwards they were composed of branches of various trees, and then flowers were added to them. Amongst the Greeks, the crowns given to those who carried off the prize at the Isthmian games were of pine; at the Olympic, of laurel; and at the Nemean, of smallage. The Romans also had various crowns to reward martial exploits and extraordinary services done to the republic. Constantine the Great first used a diadem of pearls and precious stones over a gold helm, somewhat like the close crown of later times, which seems to have been the example which the sovereigns of Europe afterwards followed.

The imperial crowns of Austria and Russia consist of a circle of gold, adorned with precious stones and pearls, heightened with fleurs-de-lys, bordered and seeded with pearls, and raised in the form of a cap voided at the top like a crescent. From the middle of this cap rises an arched fillet enriched with pearls, and surmounted with a mound on which is a cross of pearls.



The crown of the kings of Great Britain, which is a circle of gold, enriched with pearls and precious stones, having four crosses patée and four fleurs-de-lys alternately; from these rise four arched diadems adorned with pearls, which close under a mound, surmounted with a cross like those at the bottom; within is a velvet cap trimmed with ermine.

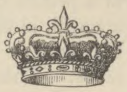


The crowns of the kings of England have at various times assumed different forms; generally consisting in early reigns of a fillet of gold, ornamented upon its upper circle by leaves, fleurs-de-lys, and crosses patée placed alternately with fleurs-de-lys. Edward IV. has first upon his coins the open crown with crosses and fleurs-de-lys; and presents the first instance of an arched or closed crown with leaves only upon the Great Seal. Richard III. is the first who placed on the Great Seal the arched crown with the crosses and fleurs-de-lys. Henry VII., however, still continued the open crown with fleurs-de-lys and pearls on his first money; afterwards with leaves and pearls with a single arch. The crown on his Great Seal has crosses patée and fleurs-de-lys, and arched, surmounted by the orb and cross. This crown, with some variations in the number of arches, continued to be used by succeeding sovereigns.

The crown of the kings of Scotland is remarkable for its elegance and beauty; composed of a circle heightened with ten crosses flory and ten fleurs-de-lys alternately; from whence arise four arches surmounted by a globe or mound ensigned with a cross patée. The cap is of velvet, lined with ermine, and adorned with four plates of gold, each enriched with a large pearl.

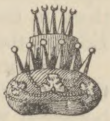
The crown of the kingdom of Hanover, as settled in 1816, to be placed over the inescutcheon of the royal arms of George III., being substituted for the electoral bonnet, consisted of a circle of gold, adorned on the upper rim with strawberry leaves, and a cross patée in the centre. From the circle arose eight arches, closing at the top, supporting a mound and cross.

The crown of the kings in France, was a circle enamelled, adorned with precious stones, and heightened by eight arched diadems, rising from as many fleurs-de-lys, which conjoined at the top under a double fleur-de-lys, all of gold.

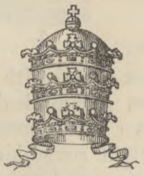


The crowns of Spain, Portugal, and Poland, are all three of the same form, and are described by Colonel Parsons in his *Genealogical Tables of Europe*. A coronet of strawberry leaves, heightened by eight arched diadems, which support a mound, ensigned with a plain cross. Those of Denmark and Sweden are both of the same form, and consist of eight arched diadems, rising from a coronet like that of an English marquis, which conjoin at the top under a mound ensigned with a cross-bottony. The crowns of other kings are similar.

The Grand Seignior bears over his arms a turban, enriched with pearls and diamonds, under two coronets, the first of which is made of pyramidical points heightened up with large pearls, whilst the uppermost is surmounted with crescents.

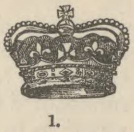


The Pope, or Bishop of Rome, appropriates to himself a tiara or long cap of golden cloth, from which hang two pendants embroidered and fringed at the ends, *semée* with crosses of gold. This cap is enclosed by three coronets like those of the degree of marquis in England; and has on its top a mound of gold, on which is a cross of the same, sometimes represented by engravers and painters pometted, recrossed, flowery, or plain. It is a difficult matter to ascertain the time when the popes assumed the three coronets above mentioned. A succession of the supreme pontiffs, engraved and published by order of Clement XIII. for the edification of his subjects in Great Britain and Ireland, represents Marcellus, who was chosen Bishop of Rome in the year 310, and all his successors, adorned with such a cap; but it appears from good authority, that Boniface VIII., who was elected to the see of Rome in the year 1295, first compassed his cap with a coronet; whilst Benedict XII. in 1335, added to it a second, and John XXIII. in 1411, a third, with a view to indicate that the Pope is the sovereign priest, the supreme judge, and the sole legislator, amongst Christians.



2. *Of Coronets.*

The coronet of the Prince of Wales was anciently a circle of gold set round with four crosses patée, and as many fleurs-de-lys alternately; but since the Restoration it has been closed with one arch only, adorned with pearls, surmounted by a mound and cross, and having a cap trimmed with ermine like the king's (No. 1).

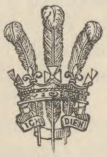


1.

The following is an extract from the royal warrant of 13th Car. II.—

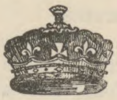
"That the sonne and heire apparent of the crowne for the tyme being shall use and beare his coronett composed of crosses and flower-de-lizes with one arch, and in the midst a ball and cross as hath our royal diadem. And that our most deare and most entirely beloved brother James, Duke of Yorke, and soe all the imediate sonnes of ourselfe and the imediate sonns and brothers of our successors kinges of England shall beare and use his and their coronetts composed of crosses and flower-de-lizes only, but that all their sonns respectively haveing the title of dukes shall beare and use their coronetts composed of crosses and flowers or leaves such as are used in the composure of the coronetts of dukes not being of our royal family."

Besides this coronet, the Prince of Wales has another distinguishing mark of honour, peculiar to himself, namely, a plume of three ostrich-feathers, with an ancient coronet of a prince of Wales (No. 2). Under this, in a scroll, is the motto, *Ich Dien*, which in the German or old Saxon language signifies *I serve.* This device was first assumed by Edward Prince of Wales, commonly called the *Black Prince*, after the famous battle of Cressy, in 1346, where, having with his own hand killed John King of Bohemia, he took from his head such a plume as that here described, and put it on his own. This, however, was doubted by the late Sir Harris Nicolas, who says that the badge of the three ostrich feathers was derived from the house of Hainault. But from a contemporary account which Sir Harris Nicolas subsequently discovered he thought the tradition was somewhat confirmed. (*Vide* Sir Harris Nicolas's account in *Archæologia*, vols. xxxi. and xxxii., for some very interesting notices on the origin and history of the badge and mottoes of Edward the Black Prince.)

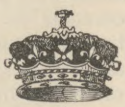


2.

The coronet of all the intermediate sons and brothers of the kings of Great Britain is a circle of gold bordered with ermine, heightened with four fleurs-de-lys and as many crosses patée alternately, as has been already shown (No. 3). The coronet of the princesses of Great Britain is a circle of gold bordered with ermine, and heightened with crosses-patée, fleurs-de-lys, and strawberry leaves alternately (No. 4).

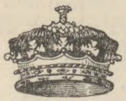


3.

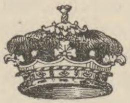


4

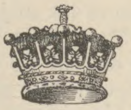
A duke's coronet is a circle of gold bordered with ermine, enriched with precious stones and pearls, and set round with eight large strawberry leaves (No. 5). A marquis's coronet is a circle of gold set round with four strawberry leaves and as many pearls on pyramidical points of equal height alternate (No. 6). An earl's coronet is a circle of gold heightened up with eight pyramidical points or rays, on the tops of which are as many large pearls, which are placed alternately with as many strawberry leaves, but the pearls much higher than the leaves (No. 7). A viscount's coronet differs from the preceding ones as being only a circle of gold, with large pearls set close together on the rim, without any limited number (No. 8). A baron's coronet, which was granted by King Charles II., is formed with six pearls set at equal distances on a gold circle, four of which only are seen in engravings and paintings (No. 9).



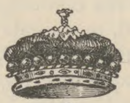
5.



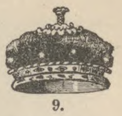
6.



7.



8.



9.

All these coronets are worn at the time of the coronation by peers and peeresses; having caps of crimson velvet within them edged with ermine, the ermine being visible below the circle of the coronet. It is difficult to determine at what period the coronet became the distinguishing symbol of peerage for the four superior degrees. In an essay, by Mr King, York herald, on the Stall Plates of the Knights of the Garter, in the *Archæologia*, vol. xxxi., it appears that, if those plates are evidence of the use of coronets, the period of their first introduction is comparatively late, as few coronets appear during the reign of Henry VIII. upon the garter plates of the knights of that order; nor did the custom of placing these marks of dignity prevail till about the beginning of the reign of Queen Elizabeth. The first coronet having a cap with ermine, which is exhibited on the garter plate, is that of Lord Godolphin, who was installed in 1704. He was the first baron who became a Knight of the Garter after the coronet was assigned to barons.

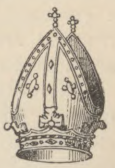
By a royal warrant dated at Whitehall, 2d June 1665, a patent was directed to pass the Great Seal ordaining barons of Scotland to wear a velvet cap with a gold circle, decorated with six pearls; and it is said a similar warrant was issued at the same time for barons of Ireland.

The eldest sons of peers above the degree of a viscount are entitled by the courtesy of England to use their father's second title; but they are not entitled to use a coronet, or the supporters annexed to the dignity. Peers of parliament and their wives only can use coronets and supporters.[1] Peeresses in their own right are also entitled to coronets and supporters.

For an account of the coronets of foreign nobility, *vide Selden's Titles of Honor*. Coronets are not worn in France or other continental states, but merely depicted with other heraldic insignia to which the bearer may be entitled.

The chapeau is a species of cap, usually crimson, turned up with ermine, and is said to be applicable to the ducal dignity only; but there is no instance in English heraldry of its bearing that qualification. It is frequently used to set a crest upon. By the regulations of the present day the Earl-Marshal prohibits the painting of crests issuing from ducal coronets or from chapeaux.

3. *Of Mitres.*



The archbishops and bishops of England and Ireland place a mitre over the shields of their arms, in lieu of a crest. It is a round cap pointed and cleft at the top, rising from a circle of gold from which are two labels or pendants, fringed at the ends. The Bishops of Durham and Meath only are entitled to use the mitre rising from a ducal coronet, signifying their palatinate jurisdiction. The practice of pourtraying the mitres of archbishops issuing from ducal coronets is an innovation which arose in the early part of the last century without any authority. Mitres were worn at the coronation of Queen Elizabeth; since which period they have only been used heraldically as episcopal insignia. The ancient Bishops of Durham also wore three feathers in addition to the princely or ducal coronet which so signally graced their mitres. This ornament, with other vestments, is still worn by the archbishops and bishops of the Church of Rome, whenever they officiate with solemnity; but it is never used in England, otherwise than over the coats of arms.

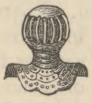
---

[1] The very recent case of Baron Wensleydale, who has been created for life only, must be considered as an exception; his lordship has all the privileges of peerage except sitting in Parliament, the House of Lords having declared that neither his patent, nor the writ under the patent, entitles him to sit.

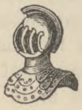
4. *Of Helmets.*

The helmet was formerly worn as a defensive weapon to cover the bearer's head, and is now placed over the arms as a mark of gentility.

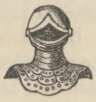
The helmets of sovereigns were of burnished gold; those of princes and lords, of silver figured with gold; those of knights, of steel adorned with silver; and those of private gentlemen, of polished steel. As to their form, those of the king and the royal family of Great Britain, are open-faced, with bars (No. 1). The barred helmet in profile is common to all degrees of peerage (No. 2). The helmet standing direct without bars, and a little open, denotes baronets and knights (No. 3); the side-standing helmet, with the beaver close, is the manner of wearing it peculiar to esquires and gentlemen (No. 4).



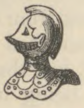
1.



2.



3.



4.

Such are now the established rules respecting the use of helmets as marks of distinction in the full heraldic achievement; but the origin of these, like many other matters connected with this subject, is involved in some obscurity. It is clear that helmets in heraldry were *not* always distinguishing insignia, at least, as respects nobility and gentry. The evidence afforded by the garter plates at Windsor, shows that the helmets of knights-subjects on all the stall plates of the Knights of the Garter, till towards the close of the reign of Elizabeth, are in profile, having the visors *close* like those now used to designate the esquire of the present day. The *barred* helmet in profile first appears on the garter plate of Henry Radcliffe, Earl of Sussex, who was installed in 1589. And it is remarkable that during the following reign there are two instances of the *close* helmet being used for peers notwithstanding; so that it appears to have been a matter of indifference whether the *close* helmet or the *barred* helmet was adopted for peers at that time. After 1603 the barred helmet became constantly borne on these plates for the nobility above the degree of barons. The first instance of the barred helmet for a baron was in the case of Lord Knolles in 1615. The helmets on the plates of Sir Robert Walpole, who was installed a Knight of the Garter in 1726, and of Sir Robert Stewart (commonly called Viscount Castlereagh, as eldest son of the Marquis of Londonderry) who was installed in 1814, are respectively the *open helmet affrontée.* It is not improbable that, about the time of the restoration of King Charles II., the full-faced open helmet became a distinguishing one for baronets and knights. In engravings of the arms of baronets and knights in the seventeenth century, the side-standing close helmet is frequently used.

5. *Of Mantlings.*

The mantling or lambrequin, attached to the helmet, had its origin from the *Cointoise,* a sort of ornamental streamer or scarf which passed round the body, and over the shoulder. This superb ornament was introduced in the reign of Henry III. It afterwards became an embellishment of the helmet; and, referring to the seals of the barons of 1300, it may be seen upon them passing from beneath the crest, and elegantly flying in graceful folds beyond the helmet. The monument of Sir John Harsic, in the time of Edward III., exhibits his tilting helmet, and is the earliest occurrence of the wreath, which took place of the cointoise as a personal ornament, from which time it assumed more prominently what was afterwards called the lambrequin. In a grant of arms, A.D. 1334, the cointoise with tassels, has a cloak-like appearance, and is there called a *mantell.* The helmet of William, Lord Hastings, on his seal attached to a deed, A.D. 1469, has a scroll instead of a cointoise. And it has been conjectured that the scroll or lambrequin was an imitation of the cointoise after it had been torn in battle. The mantling, when it became an heraldic ornament, was usually *gules* lined, or "*doubled*" argent; but in Elizabeth's time, as now, it assumes the colours of the wreath, being the two first of the coat-armorial, the metal being for the lining or doubling. In many of the old grants of arms this was not, however, always so; and until a late period the mantling was fully blazoned or described. It was sometimes charged with heraldic bearings or other figures. The royal mantling of the present day is gold doubled ermine; and like those of the nobility and gentry forms a species of scroll-work flowing from the helmet, and ornamenting both sides of the shield.

6. *Of the Wreath.*

The wreath or torse was formed of two pieces of silk of the two first colours of the armorial bearings, twisted together by the lady who chose the favoured individual for her knight. It took place of the cointoise about the time of Edward III. It surrounded the upper part of the helmet as a fillet, and appeared (as a coronet did in some instances) to bind the lambrequin close to the helmet. From the centre of the wreath, or coronet, issued the crest (vide *Crest,* and *Mantling*). In blazoning a crest, it is usually said to be upon or within "a wreath of the colours," by which colours are meant the two first of the arms; but sometimes the wreath has been composed of all the colours of the arms when more than two. An example occurs in the grant of a crest to the city of Exeter, A.D. 1580, where the wreath is or, gules, and azure; those colours being in the arms. The liveries of servants should follow the colours of the wreath.

7. *Of Crests.*

The crest is the highest part of the ornaments of a coat of arms. It is called *crest,* from the Latin word *crista.*

Crests were formerly great marks of honour, because they were only worn by heroes of great valour, or by such as were advanced to some superior military command, in order that they might be the better distinguished in an engagement.

Crests appear to be nearly coeval with the introduction of armorial ensigns upon shields, as there are instances as early as the reign of Henry III. Richard I. is represented with something upon his helmet which may have been the prototype of the heraldic crest, somewhat in the form of a fan charged with a lion rampant or passant upon it. By the Close Rolls (54 Hen. III.), armour was provided for the knights going into the Holy Land, in which, amongst other articles, are mentioned two crests. On the seals, previously quoted from those attached to the Barons Letter to the Pope, A.D. 1300, there are examples of crests.

The first English monarch who introduced his crest upon his Great Seal was Edward III., which he wears on his helmet. Crests were soon assumed by private families. Edward III., in 1333, granted a crest to William Montacute, Earl of Salisbury, and by a further grant made it hereditary; and in 1334, Guyen, king of arms, granted a crest to Thomas Andrews. Crests were also called *cognizances,* a very obvious term when considering their use—that the bearers *might be known* by them.

Crests, therefore, are as equally significant of the lineage of persons entitled to use them as arms are; and, as such, are inseparably annexed to individual families. The popular notion that crests are assumptive at pleasure, has no foundation in the nature or practice of heraldry; nor that the crest of a maternal ancestor may be borne. Heiresses do not convey the crests of their families to their descendants who are entitled to quarter their arms.

The crest was placed upon the helmet, *within* the wreath, not *upon* the wreath, as described in modern times; or might be issuant from a ducal or other coronet, or placed on a chapeau; and, although governed by the same laws as paternal arms with respect to hereditary masculine descent, it does not necessarily have any allusion to, or derivation from the bearings upon the shield. The crest represented without the armorial shield is usually placed on a wreath, or from a coronet, as the case may be, without the helmet or lambrequin.

The "*Cognizance*" is also a term used synonymously with "*Badge*;" not to be understood as a crest, but as a *badge*. They are, at least, coeval with armorial bearings, if not of a prior date. Henry II. adopted certain distinctive figures which had reference to his name. This was the *planta genista*. Badges were confined to royalty till about the time of Richard II., when they were adopted by the nobility. They were not substituted for armorial devices in the field, except on banners, and that only during the wars between the houses of York and Lancaster. The kings of England bore a variety of badges, in different reigns, as did also the several members of the royal family during the middle ages. Of the royal badges of sovereigns which have descended to modern times, is the well-known rose, the thistle for Scotland, and the trefoil for Ireland. But the trefoil was not formerly a royal badge. The Prince of Wales's plume is the peculiar badge belonging to the eldest son of the sovereign.

Badges used by the ancient nobility served rather to denote the servants or retainers, and were distinct from armorial bearings, and embroidered upon the liveries. These badges were defined in their character; and the use of them in the present day is very limited. They never appear as a crest; and are consequently without the wreath, or any other bearing which characterizes crests. Badges were frequently displayed upon the funereal banners of sovereigns and nobles, accompanied by their motto and other devices.

8. *Of the Scroll.*

The scroll is the ornament placed below the shield, containing a motto or short sentence alluding thereto, or to the bearings, or to the bearer's name. Thus, the motto of the Marquis of Cholmondeley is *Cassis tutissima virtus*—"Virtue is the safest helmet," on account of the helmet in the coat of arms; and the motto of Earl Fortescue is *Forte scutum salus ducum*, "A strong shield is the safety of the commanders," alluding to the name of that ancient family. Sometimes, however, the motto has reference to neither, but expresses something divine or heroic; as that of the Earl of Scarborough, *Murus æreus conscienta sana*, "A good conscience is a wall of brass." Others are enigmatical, as that of the royal achievement, which is *Dieu et mon droit*, "God and my right," introduced in 1340 by Edward III., when he assumed the arms and title of king of France, and began to prosecute his claim, which occasioned long and bloody wars, fatal by turns to both kingdoms; or that of the Prince of Wales, *Ich dien*, "I serve," the origin of which has already been explained.

9. *Of Supporters.*

Supporters are figures standing on the scroll, and placed at the side of the escutcheon; they are so called because they seem to support the shield. The rise of supporters is, by Menestrier, traced to ancient tournaments, in which the knights caused their shields to be carried by servants or pages under the disguise of lions, bears, griffins, blackamoors, and the like, who also held and guarded the escutcheons, which the knights were obliged to expose to public view for some time before the lists were opened. But Sir George Mackenzie dissents from this opinion, and contends (*Treatise on the Science of Heraldry*, chap xxxi., p. 93) that "the first origin and use of them was from the custom, which ever was and is, of leading such as are invested with any great honour to the prince who confers it."

The origin of supporters is still, however, involved in mystery. Like many other points connected with heraldry, they derived their origin at no ascertained time, and grew up into use from causes at present unknown. Theories have been attempted to be formed for their introduction into heraldry, but the most probable is that of various figures or animals being introduced upon seals as ornaments to fill up the open spaces which occur in a circular seal with the triangular or heater shield exhibiting the arms. Instances of this character occur very early, as may be seen upon the seals attached to the Barons' Letter to the Pope in 1300. After that period these figures or animals assumed a more decided character upon seals, and are found supporting the helmet as early as the time of Richard II. On the beautiful seals of the period from the reign of Henry IV. to that of Henry VI., the shields containing the arms are frequently placed so low as to cover part of the legend, while the helmets and crests are supported by various animals, natural and chimerical. The recognition of supporters, in the sense in which they are now understood, as regards the use of them by private families, may be dated about the time of Henry VII.; and there are a few private families who continue to bear them at this day, and whose title to use them has been allowed by the heralds at various times. When supporters first became the distinguishing mark of nobility, or were exclusively considered properly to appertain to the peerage or to the Knights of the Garter and Bath, is not quite clear. It appears that the first stall plate of a Knight of the Garter bearing supporters was that of John Beaufort, who was elected into that order 20th Henry VI.; but it is doubted whether the plate is of so early a date. But the first plate of this kind, which may with certainty be considered as contemporaneous with the installation, is that of John Dynham, Lord Dynham, who was elected a Knight of the Garter 1st Henry VII.; upon this plate the supporters, which are two stags, support the helmet and crest only. In the case of Henry Earl of Northumberland, who was elected in the same reign, the supporters are placed outside the garter which encircles the shield. Supporters were not even general at this time, as several plates intervening between that period and 29th Henry VIII. are devoid of them. Subsequently to the later period, however, supporters occur on all the succeeding plates of knights (vide *Archæologia*, vol. xxxi.).

There is, however, some reason to imagine that the jousts and tournaments were influential in the introduction and use of supporters. In an illuminated MS. remaining in the Herald's College, said to have been written and emblazoned for the use of Prince Arthur, the eldest son of Henry VII., are depicted a series of banners of arms of the ancient kings, nobles, and knights, each of which is held by some armorial or heraldic figure; being in each case the same, or at least one of those which are to be found on their seals, or in other evidences, as supporters.

The supporters which are attributed to the kings of England have varied from time to time, previously to their final settlement by James I. Edward III. used a lion and eagle; Richard II., the lion and white hart; Henry IV., the heraldic antelope and swan; Henry V. and Henry VI., the lion and heraldic antelope; Edward IV., the lion and black bull; Richard III., the lion and white boar; Henry VII., the lion and red dragon, which were continued to be used till the end of the reign of Elizabeth. These do not, however, appear on any of their great seals, upon which the use of supporters does not occur. On the great seal of James I. a lion is holding the banner of St George, and an unicorn that of St Andrew. The ancient supporters of Scotland were two unicorns, one of which James I. retained to support the royal arms of England on his accession to the English crown. Supporters (sometimes supporting the crest and helmet only) were used on the seals of the royal family from the time of Henry V.

Supporters are borne by corporations and trading companies; one of the earliest grants was made to the Leather Sellers Company, 22d Henry VIII.

V.—OF THE RULES OR LAWS OF HERALDRY.

I. The *first* and most general rule is, to express one's meaning in proper terms, so as not to omit any thing which ought to be specified, and at the same time to be clear and concise without tautology.[1]

II. The tincture of the field must first be mentioned, and then proceed to the principal charges which possess the most honourable place in the shield, such as fess, cheveron, &c., always naming that charge first which lies next to and immediately upon the field.

III. After naming the tincture of the field, the honourable ordinaries, or other principal figures, their attributes, and afterwards their metal or colour, must be specified.

IV. When an honourable ordinary, or some one figure, is placed upon another, whether it be a fess, cheveron, cross, &c., it is always to be named after the ordinary or figure over which it is placed, with the expression *surtout* or *over all.*

V. In blazoning such ordinaries as are plain, the bare mention of them is sufficient; but if an ordinary should be made of any of the crooked lines, its form must be specified; that is, whether it be engrailed, wavy, &c.

VI. When a principal figure possesses the centre of the field, its position is not to be expressed.

VII. The number of the points of mullets or stars must be specified when more than five; and also if a mullet or any other charge be pierced, it must be mentioned.

VIII. When a ray of the sun, or other single figure, is borne in any other part of the escutcheon than the centre, the point it issues from must be named.

IX. The natural colour of trees, plants, fruits, birds, and the like, is by the word *proper.* unless they differ from their natural colour

X. When three figures are in a field, and their position is not mentioned in the blazoning, they are always understood to be placed, two above, and one below.

XI. When there are many figures of the same species borne in a coat of arms, their number must be observed as they stand, and distinctly expressed.

But, for the better elucidation of this last rule, we have inserted examples of the *different dispositions of figures,* in which they are properly represented. Thus, *two* may be ranged in pale, in fess, &c. (Nos. 1, 2). *Three* may be 2 and 1, as also in bend, &c. (Nos. 3, 4). *Four* are placed 2 and 2, sometimes called cantoned (No. 5). *Five*, 1, 3, 1, in cross; or 2, 1, 2, in saltier (Nos. 6, 7). *Six*, 3, 2, 1, in pile; or 2, 2, 2, paleways (Nos. 8, 9). *Eight*, in orle, or on a bordure (No. 10). *Nine*, 3, 3, 3, barways; or 3, 3, 2, 1, in pile (Nos. 11, 12). *Ten*, 4, 3, 2, 1, in pile; or else 4, 2, 4, barways (Nos. 13, 14). *Twelve* are placed 4, 4, 4, barways (No. 15).

When the field is strewed with the same figures, this is expressed by the word *semée;* but, according to the opinion of a French armorist, if the figures strewed on the field are whole ones, it must be denoted by the words *sans nombre;* whereas, if part of them be cut off at the extremities of the escutcheon, the word *semée* must then be used.

VI.—OF MARSHALLING ARMS.

This is understood to be the art of disposing several coats of arms in one escutcheon, and of arranging the contingent exterior ornaments. Originally, only one coat was exhibited in the shield; but afterwards, to denote descent or marriage, the arms of other families were borne on seals in separate escutcheons; sometimes without any variation as to the size of the escutcheons; but at other times the principal shield was surrounded by smaller ones. Marriages were, at length, shown by the arms of the wife being *dimidiated* with those of the husband, *dimidiation* representing only one-half of each coat parted by a per pale line. This course, however, from the inconvenience of dividing some coats, whereby their characteristic bearings became lost, was supplanted by the practice of *impaling* the arms of the wife with those of her husband, thus preserving the man's arms entire on the dexter, and the lady's on the sinister. Sometimes one coat only was dimidiated. Nothing in the early times denoted marriages with heiresses unless the arms of the heiress had a prominent place on the seal, or were impaled on the *dexter* side of her husband's. The practice, alluded to by some heralds, of placing the arms of more than one wife with those of the husband is not now followed, though Leigh has given some directions upon the point. The shield or escutcheon of pretence, to show the arms of the wife as the heiress of her family, is not of very early introduction.

But the principal occasion of a multiplicity of arms in one shield, is that of quartering the arms of heiresses, a system which first commenced about 1348, when the Earl of Pembroke quartered the arms of Valence. The first quarter contains the paternal arms of the family; the remaining ones those of the several heiresses with whom the ancestors of the bearer had intermarried; and of such heiresses whose arms were similarly acquired through their respective families. Other causes, at present unknown, or which are obscure in their origin, have occasioned arms to be borne as quarterings, but which are in some cases presumed to be feudal or territorial.

---

[1] In Kent's *Grammar of Heraldry*, published in 1716, p. xi., tautology is condemned in these very strong terms: "You must use no repetition of words;" "but especially not of the words *of, or, and, with,* for the repetition of these is reckoned *an unpardonable crime.*"

In arranging a shield for quarterings, the shield is divided by perpendicular and horizontal lines into as many squares as may be required. The arms of the most ancient heiresses, as the marriages occur in the lineal descent, have precedence of subsequent ones in chronological order; the various quarterings (if any) of those respective heiresses being subjected to the like rule. During the middle ages, if the party were entitled to bear the royal arms as a quartering, it had precedence of all others—this was the melancholy case of the Duke of Buckingham in the time of Henry VIII. The royal arms of Brotherton, at this day, is borne next the paternal coat by the Howards, although it is there out of its place in point of pedigree and descent. It was not unfrequently the case in private families that precedence was given to the greatest heiresses; but the rule at the present time is to arrange the arms as the marriages bring them in. Children of an heiress, and all the descendants of an heiress, also descending from her through heiresses, are entitled to quarter the arms of such heiresses.[1]

Archbishops and bishops, and some deans of cathedral churches, bear the arms of their respective sees and offices impaled on the dexter side with their own paternal arms. This practice commenced about the time of the Reformation. Archbishops and bishops use neither crests nor mottoes. The Lord-Lyon, and the kings of arms in England and Ireland, bear the arms of their offices in the same way as bishops, and ensign their shields with their crowns.

Unmarried ladies bear their arms and quarterings (if any) in a lozenge; as also do widows, impaled with those of their deceased husbands.

Commoners marrying peeresses in their own right bear their arms in the usual way, with the family arms of the peeress impaled; but if she is an heiress, then with her arms in an escutcheon of pretence ensigned with a coronet of her dignity, the whole set on the dexter side of her family arms, which are borne separately in a lozenge ensigned with her coronet, and supported by her supporters.

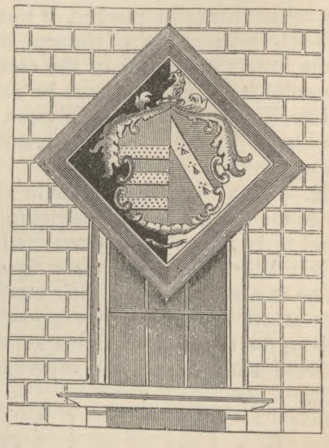
In cases of peers their coronets are placed immediately on the shield; and upon the coronet is placed the helmet, with its lambrequin, wreath, and crest. But the crown of the sovereign, and the coronets of the royal family, are placed upon the helmet.

Baronets of England and Ireland are entitled to place the badge of their dignity—*argent a sinister hand couped gules*—in an escutcheon of pretence, or in a canton in their arms. The baronets of Scotland have a similar privilege, their arms being, *argent a saltire azure, on a shield of pretence, the royal arms of Scotland ensigned with the royal crown.* The baronets of Scotland also suspend the badge of their order by an orange-coloured ribband from the shield; the badge is then within a circle, having the motto, "*Fax mentis honestæ gloria.*"

Knights of the several British Orders of knighthood surround their shields of arms with the respective ensigns of the Order; in which case their arms, with those of their wives are, in a separate shield, placed on the sinister side.

The Order of the Garter was instituted between the 24th June and 6th August 1348 (as discovered by the late Sir Harris Nicolas (*vide Archæologia*, vol. xxxi., p. 130), consisting of the sovereign and twenty-five knights. Since that period it has undergone no material alteration in its constitution, except that foreign princes and members of the royal family, descendants of King George I. together with the Prince of Wales, who was in 1805 declared a constituent part of the original institution, are not now included in the original number of twenty-five knights. The Order of the Thistle in Scotland is said to have a very remote antiquity. The recital in Queen Anne's Letters Patent of Restoration, give it a date as early as the ninth century. It consisted of the sovereign and twelve knights, and has undergone but very little change in its constitution. The origin of the Order of the Bath is attributed to the beginning of the reign of Henry IV., as a distinct Order, and was frequently conferred on occasions of coronations; but after that of Charles II. it was suffered to fall into disuse. In 1725 George I. revived the Order; in 1815 it was enlarged, and divided into three classes; and further amplified in 1848 by her present Majesty. The Order of St Patrick was instituted by George III. in 1783 for Ireland, to consist of the sovereign, a grand master, and fifteen knights. The number of knights was augmented by King William IV. in 1833. The Order of St Michael and St George was instituted after the general peace of 1814, the sovereignty of the Island of Malta being then ceded to the king of Great Britain. It consists of three classes; and, with some modifications, continues to be conferred upon natives of the Ionian Islands and Malta. The Royal Hanoverian Guelphic Order was established in 1815, consisting of three classes, and was conferred upon British and Hanoverian subjects. This Order ceased to be a British Order upon the accession of her present Majesty to the crown of these realms; when Hanover devolved upon the late Duke of Cumberland, as the sovereign of the latter kingdom. Her Majesty Queen Victoria has signalized her reign by the creation of an Order for the reward of many of our brave heroes who have fought during the Crimean War.

VII.—OF FUNERAL ESCUTCHEONS.



The *hatchment* represents the armorial ensigns affixed to the fronts of houses when any of the nobility and gentry die, the arms therein being those of a private gentleman and his wife parted per pale, with mantling, helmet, crest, and motto; the dexter side, for the husband, having the ground without the escutcheon black, denotes the man to be dead; and the ground on the sinister side being white, signifies that the wife is living.[2]

When a married gentlewoman dies first, the arms on the sinister side have the ground without the escutcheon black, whereas those on the dexter side, for her surviving husband, are upon a white ground, but without any crest, helmet, lambrequin, or motto.

When a bachelor dies, his arms may be depicted single or quartered, with a crest, helmet, lambrequin, and motto, but arms not impaled as the two first are, and all the ground without the escutcheon is also black.

---

[1] A lady is an heiress if she has no brothers who leave issue; if she has sisters they become co-heiresses with her.

[2] The exterior ornaments are omitted in the engraving merely for the sake of simplifying it, the object being to show the funereal accidents.

When a maid dies, her arms, which are placed in a lozenge, may be single or quartered, like those of a bachelor; all the ground without the escutcheon is also black, and devoid of the exterior ornaments.

When a widower dies, his arms are impaled with those of his deceased wife, having a helmet, mantling, and crest, and all the ground without the escutcheon black.

When a widow dies, her arms are impaled with those of her deceased husband, but inclosed in a lozenge, and without the exterior ornaments; all the ground without the escutcheon being also black.

By these rules may be known, upon the sight of any hatchment, what branch of the family is dead; and by the helmet or coronet, the title and degree of the person deceased.

In Scotland, a funeral escutcheon not only shows the arms and condition of the defunct, but is also a proof of the gentility of his descent; and such persons for whom this species of escutcheon can be made out are legally entitled to the character of gentlemen of blood, which is the highest species of gentility. The English hatchment exhibits no more than a right to a coat of arms, and the status of the deceased person.

The funeral escutcheon, as exhibited in Scotland, France, and Germany, is in the form of a lozenge, above six feet square of black cloth; in the centre of which is painted, in proper colours, the complete achievement of the defunct, with all its exterior ornaments and additional marks or badges of honour; and round the sides are placed the sixteen arms of the families from which he derives his descent, as far back as the grandfather's grandfather, as the proofs of his gentility. They exhibit the armorial bearings of his father and mother, his two grandmothers, his four great-grandmothers, and his eight great-grandmothers' mothers; and if all these families have acquired a legal right to bear arms, then the gentility of the deceased person must be accounted complete, but not otherwise. On the four corners are placed mort-heads, and the initials of his name and titles or designation; and the black interstices are powdered with tears.

Funerals of the nobility and gentry during the middle ages were the means of displaying heraldry in all its pomp and magnificence; and perhaps nothing contributed more to such an exhibition of real heraldry than those occasions. Funerals in those times, as regards the heraldic attributes, and the marshalling the solemnities observed at them, were exclusively within the province of heralds, who attended them, and took an official and prominent part in the ceremonies. The mourning costume and its decorations were subjected to certain laws and regulations as affected rank in the persons of the mourners. The number and dimensions of the funereal banners and pennons were likewise subjected to express rules scrupulously maintained. The nature and construction of the hearse (which was the large timber erection in the church for the reception of the corpse and the assembling of the principal mourners) also depended upon the rank and condition of the defunct in its extent, and in the number of escutcheons and lights with which it was adorned. The heralds bore the shield and tabard of arms of the deceased, his helmet[1] and crest, and his sword and spurs in solemn procession, which, with the banners and pennons, were afterwards hung up over the grave, and may still be seen remaining in many of our churches. At the funeral obsequies of princes and nobles a wax effigy of the deceased was arrayed in the robes and other insignia of dignity, and laid on the top of the coffin. Some of these figures are still preserved in the Abbey at Westminster. This custom has the appearance of having been derived from the *jus imaginum* of the Romans. Great numbers of relations and friends attended these solemnities, which, from their extent, and the length of time they occupied (often several days), must have occasioned no inconsiderable labour and expense. Expensive entertainments were also given on these occasions; and there are some curious remarks respecting the feasting and degree of hospitality which took place, in the records made by the heralds on these occasions. Some idea of the magnificence of these funerals may be formed even from the few relics which are still preserved by some of the companies of London, who have in their possession rich palls of cloth of gold magnificently embroidered with curious devices and arms, which were used at the funerals of the citizens.

Besides the attendance of the heralds upon these ceremonies, it also formed part of their official duty to record the genealogical account of the family of the deceased, together with their arms. These records form a very important class of evidence of descent, and are deposited in the Heralds' College. Most of them are richly emblazoned and engrossed upon vellum, and are technically called "Funeral Certificates." They afford minute evidence of the births, marriages, and issue of the children and family of the deceased, and are invaluable as possessing the nature and character of *legal* evidence. Soon after the Revolution of 1688-9 the heralds ceased to attend the funerals of the nobility and gentry, and their office in these respects is now confined to the state funerals of the royal family, or of those illustrious heroes whose funerals are conducted at the public expense.

Nearly all that is reserved for modern times of the heraldic splendour of these funerals is the hatchment, descriptions of which have been given in this article. It is, however, only the compendium of the heraldic honours paid to the memory of the deceased in former times; and, like its predecessors, finds a place over the tomb which covers his remains.

Thus, by archæological researches, we have been enabled to present a concise view of practical heraldry. If, in the sixteenth century, the labours which were bestowed in writing books, full of the purest inventions and the grossest absurdities, had been directed into the paths of truth, much more accessible then than now, heraldry would have disclosed a history of events, of persons, and of kingdoms, which is irretrievably lost. To the learning and study of modern archæologists we are indebted for some of the information, which should have been afforded us by men who lived in ages nearly approaching those when heraldry originated, and who could have thrown a lustre instead of a mist upon many incidents in the practice and science of heraldry. In this article we have touched the principal points of the subject, and have to confess our obligations to Meyrick's *Critical Enquiry into Armour;* Laing's *Ancient Scottish Seals;* Nicolas's *Orders of Knighthood*, and his valuable contributions to the Society of Antiquaries; Boutell's *Monumental Brasses;* Gough's *Sepulchral Monuments;* and the publications of various Archæological Societies. The illustration of many facts and dates has also been supplied from records of the College of Arms in London.

(T. W. K.)

---

[1] The plume of feathers usually carried at funerals at the present day is said to have succeeded to the carrying of the helmet in former times.

HERAT or HERAUT (anciently *Arid* or *Artacoana*), capital of Shah Mahmood's state on the W. frontier of Afghanistan, 2700 feet above the sea level, 3 miles N. of the Hury River, in a beautiful and fertile valley; N. Lat. 34. 22., E. Long. 62. 9.; 360 miles W. of Cabool. It is entirely surrounded by an earthen mound 50 feet high, by two trenches, and a ditch. From the mound rises a wall 25 feet high, and upwards of 100 bastions of unburnt brick. At the N. end of the town is a strong citadel defended by a ditch and massive towers. To the N. of the town are the huge mound raised by Nadir Shah, and a little farther the gorgeous ruins of the Moosullah of Imaum Reza. As there is no drainage the town is extremely filthy, although in the fifteenth and sixteenth centuries it was one of the finest cities in the world.

Commercially, the position of Herat is important. It receives shawls, indigo, sugar, spices, chintzes, muslins, brocades, scarfs, leather, and hides from Afghanistan; tea, sugar, porcelain, glass, silk, cotton, cloth, woollens, carpets, and hardware from Persia, Russia, and Turkey. The Herat carpets are famous. The annual revenue of Herat is estimated at perhaps L.100,000. It was unsuccessfully besieged by the Persians in 1838. Pop. less than 45,000.

HERAULT, a department in the S. of France, bounded on the N.E. by Gard, N.W. by Aveyron and Tarn, and S. by Aude and the Gulf of Lyons. It formed part of the old province of Languedoc, and has an area of 2444 square miles; between N. Lat. 43. 10. and 44., E. Long. 2. 30. and 4. 10. Its greatest length is 84 miles, breadth 50. About a third of the department consists of moorland, heath, and common; a fourth of arable land; a sixth of vineyards; and an eighth of wood.

The S. prolongation of the Cevennes Mountains forms the N. boundary of the department, under the names of Garrigues, Orbe, Espinous, and the Black Mountains. The highest point is about 4250 feet above the sea-level. The ridge forms the watershed between the waters of the Atlantic and the Mediterranean, and from it there flow the Vidourle, Masson, Hérault, Livron, and Orbe. Of these the Hérault, 80 miles long, is the chief, and gives name to the department. The Orbe forms the boundary between the department and that of Gard.

The high mountains of the N. are partly barren, partly wooded. In the extensive plains of the centre the vine and olive flourish, and in the S. grain is produced. The soil of the N. is chalky clay, of the centre light gravel, and of the S. a strong rich loam. The "garrigues" are considerable portions of waste land, covered with heath, shrubs, &c. Mont St Loup, Couques, and St Thibérg, the first of which is 750 feet high, are extinct volcanic cones.

The greater part of the S. coast consists of a series of salt marshes, separated from the sea by a narrow strip of land. The Marsh of Thau, the largest, stretches from the mouth of the Hérault, and communicates, through the Marsh of Frontignan, with that of Mangino, on the E. frontier of the department. The Canal du Midi, after stretching about 30 miles into the department, terminates at Agde. From Cette the navigation is kept up through the marshes by the canals of Agde and Radelle to Aigues Mortes. The coast line of the department is 66 miles long. Besides the canal navigation the department has seven national roads, one of which is the main route between Paris and Spain; also a railroad joins Cette, Montpellier, and Nîsmes.

The climate generally is warm, dry, and healthy, except near the marshes which cause agues and fevers. The prevailing winds are N.E. and S.E.

Fish abound in the salt marshes. The vegetable productions comprise aromatic and dyeing plants; the Ilex oak prevails in the forest. The mineral wealth of the department is considerable. Mines of lignite, coal, iron, copper, and lead are wrought. It produces magnificent blocks of marble; also alabaster, gypsum, granite, sandstone, potters' clay, alum; and the marshes supply France with salt.

Wine and oil constitute the chief agricultural wealth of the department. The red wines of St Georges, Viragues, St Christol, and the white wines of Frontignan and Lunel, are held in high estimation. The annual quantity of wine produced in Hérault is more than 45,000,000 gallons. Of this a fifth is consumed by the department, a fifth is exported as wine, and the remainder converted into spirits for commerce. Considerable quantities of wheat and oats are grown; also mulberries, pomegranates, figs, raisins and other dried fruits, and olives, are prepared for exportation. The department rears 10,000 horses, and upwards of half a million of sheep.

Woollen, cotton, and silk factories are established in the department. There are also paper-mills, distilleries, and factories for verdigris and other chemical substances.

Hérault is divided into 4 arrondissements, 36 cantons, and 326 communes, as follows:—

Arrondissements.	Cantons.	Communes.	Pop. in 1837.
1. Montpellier	14	113	148,649
2. Bézier	12	97	134,605
3. Lodère	5	72	56,700
4. St Pons	5	44	49,332
	36	326	389,286

The capital is Montpellier.

HERBELOT, BARTHELEMI D', a celebrated French Orientalist, was born at Paris in 1625. At a very early age he gave himself up to the study of the Eastern tongues; and, to perfect his acquaintance with them, travelled into Italy, where he enjoyed the friendship of the cardinals Barberini and Grimaldi. On returning to Paris he obtained, through the munificence of Fouquet, a pension, of which he was afterwards deprived on the fall of that minister. He was compensated, however, with the office of Oriental interpreter to the king. After some years he again visited Italy, and was received with especial honour by Frederick II. of Tuscany, who presented him with a large number of valuable Oriental MSS., and tried to attach him to his court. D'Herbelot, however, returned to France at the urgent solicitation of Colbert, who, on the death of Pierre Auvergne, made him Syriac professor in the Collège-Royal. D'Herbelot died, after a short illness, at Paris, December 8, 1695.

The great work by which D'Herbelot's fame is still preserved is his *Bibliothèque Orientale*, Paris, 1697. This work, which was published two years after the author's death by Galland, occupied D'Herbelot during the greater part of his life. It is based on the immense Arabic dictionary of Hadjy Khalfa, of which, in fact, it is an abridged translation; but it also comprises the substance of a vast number of other Turkish and Arabic Encyclopædias. The erudition it displays is boundless, but the field embraced is far too vast for the labours of a single man, and many errors have consequently crept into the work. With all his learning D'Herbelot seems to have been deficient in critical sagacity. He died, too, before seeing his work through the press, and there is consequently a want of minute accuracy in many of its details, and of harmony between the various parts of the work. Besides the *Bibliothèque Orientale*, D'Herbelot wrote several works, such as an Anthology, and an Arabic, Persian, and Turkish Lexicon, none of which, however, have been published. The *Bibliothèque* has been twice reprinted, first at Maestricht, fol., 1776; and again at the Hague, in 4 vols. 4to, 1777–99. The latter of these two editions is enriched with the contributions of Schultens and Reiske. A German translation of it appeared at Halle, in 4 vols. 8vo, 1785-90; and an abridgement by Désessarts, at Paris, in 1782.

HERBERT, EDWARD, Lord Herbert of Cherbury, born at Montgomery Castle in 1581, was educated at Oxford:

He was presented to Queen Elizabeth in 1600, and was made Knight of the Bath on the accession of James I. In 1608 he visited France, where his high sense of honour, along with his courage in a duelling age, opened up to him a ready means of distinguishing himself. In 1610 he served under Maurice, Prince of Orange, at the siege of Juliers, where he displayed a courage bordering on rashness. In 1614 he set out again to fight under the same leader against the Spaniards. Thereafter he went to Italy, and returning, was entrusted by the Duke of Savoy with the project of conducting 4000 Languedoc Protestants into Piedmont. This having been forbidden by Marie de Medicis, Herbert was arrested, but immediately set at liberty. Whilst preparing himself for new exploits he was appointed in 1616 ambassador extraordinary to France by James I., for the purpose of renewing the alliance between England and France. He provoked the determined hostility of the Duke de Luynes, Constable of France, who sent his brother to the English court to complain of Herbert. He was recalled in consequence; but on the death of De Luynes he was re-appointed and invested with still greater powers. In 1625 he was created peer of Ireland, under the title of Baron of Castle-Island. In 1631 he was created baron of England, under the title of Lord Herbert of Cherbury. His castle was destroyed during the civil wars of Charles I. He died in London on the 20th August 1648, aged sixty-seven.

Besides being a brave soldier and an accomplished gentleman, Herbert is to be ranked as an acute and original thinker. While at Paris in 1624 he published his treatise, *De Veritate prout distinguitur a revelatione, a verisimili, a possibili, et a falso.* Professing to have studied carefully the writings of many authors, sacred and profane, he declares himself unable to arrive at a complete notion of *truth.* He accordingly turns to the examination of *self.* Against absolute dogmatism he holds it as a matter of fact that we do not know all things, while against absolute scepticism he holds that we do know some things. Between these extremes truth is to be found. Still farther, we are endowed with certain faculties which enable us to undertake the search after truth. These faculties, then, must be carefully examined as to their laws and their relation with objects. After this must come the work of separating the true from the probable, the probable from the possible, and the possible from the false. Above all, credulity is to be guarded against. Like Des Cartes he starts from consciousness. As the result of his investigation, he considers the mind not a *tabula rasa*, but a book closed; and the action of the external world becomes the occasion of the opening of the book. Hence material objects, as only the *occasion*, are not the *cause* of true knowledge. Herein his system is substantially the same as Kant's. Starting with seven common notions or maxims which he considers will be admitted by all who seek truth, he proceeds to make a fourfold division of truth:—1*st*, Truth in the agreement of a thing with itself; 2*d*, Truth in the agreement between the appearance of a thing and the thing itself; 3*d*, Truth in the agreement between the conception of our faculties and the objects; and 4*th*, Truth in the necessary agreement between these different kinds of conformity. Of these four the most important is the last, or truth of intelligence, which is independent of the senses. When sound, both bodily and mentally, these truths impress us as if they came clear from heaven to enable our minds to decide regarding what passes before us in the external world.

Herbert divides the faculties of knowing into four,—the natural instinct of reason, internal sense, external sense, and reasoning. The instinct of the reason is that faculty by which we seize "common notions." Internal sense is twofold,—it informs us what is passing within ourselves, as well as what are our relations to the world. External sense makes us cognizant of the form, position, and constitution of external objects. By the reasoning or discursive faculty we seize the points of difference or agreement, of opposition or harmony of concepts. Defective as this fourfold division is, Herbert frequently confounds the instinct of the reason, the internal sense, and the discursive faculty.

In turning to revelation, Herbert lays down five maxims or common notions, which form the foundation of all true religion:—1*st*, There is a Supreme Being; 2*d*, Man should worship this Being; 3*d*, Virtue is the principal part of this worship; 4*th*, Repentance expiates faults; 5*th*, There must be a future state in which virtue is rewarded and vice punished. What is false does not exist *per se.* Truth is the basis not only of truth, but even of error. Error is truth incomplete, obscured, mutilated. His *Tractatus de Veritate*, &c., was republished in 1645, along with a new one, *De religione Gentilium errorumque apud eos causis.* He wrote also an account of the reign of Henry VIII. His *Autobiography* was not published till 1764. Some posthumous poems of no great merit were also published.

His views, both in philosophy and religion, encountered very great opposition during his life. Hobbes, Locke, and Gassendi attacked the one; and as to the other, the theologians of the period condemned him as the leader of the Freethinkers. However, he professed great respect for religion, and regarded Christianity as the most beautiful of religions. It is not a little remarkable, that notwithstanding his objections to a partial revelation he professes most seriously to have had his doubts settled as to the publication of his treatise *De Veritate*, &c., by praying for a divine intimation, which he declares was granted him.

HERBERT, *George*, to whose name the epithet of "Holy" is always attached, as "judicious" to that of Hooker, and "moral" to that of Gower, was a younger brother of Lord Herbert of Cherbury, and was born at the castle of Montgomery, in Wales, April 3, 1593. After leaving Westminster, where his public education began, he went to Trinity College, Cambridge. In course of time he became a fellow of his college, and in 1619 public orator to the University. Donne and Wotton were his intimate friends; and Lord Bacon is said to have attached so much importance to his literary judgment, that he never published anything which had not first been approved by him. With these high connections he looked forward to court preferment, and indeed obtained from King James a sinecure of L.120 a-year, that had once been held by Sir Philip Sidney. "With this," says his biographer, Izaak Walton, "and his annuity, and the advantages of his college and of his oratorship, he enjoyed his genteel humour for clothes and court-like company, and seldom looked towards Cambridge unless the king were there, but then he never failed." But Herbert's hopes were dashed by the death of the king, and to maintain himself he entered the church. In 1626 he was made first prebend of Leighton Bromswold, or Layton Ecclesia, and four years later rector of Bemerton, in Wiltshire, where he spent the remainder of his life. Before entering on the duties of his parish, he married, and with his wife made a solemn renunciation of the frivolities of the gay world for which, even after taking orders, he seems to have always retained a hankering. Once fairly installed, he became the model of a country clergyman, and laboured with a truly apostolical zeal and self-devotion. His prose work, the *Country Parson*, is a faithful picture of what he regarded as his ministerial duties, and the best way of performing them. But his constitution soon broke down under the combined influences of over-work and a quotidian ague, which afflicted him during the later years of his life. He died in 1632, before he had reached his fortieth year.

Herbert's principal work is entitled *The Temple; Sacred Poems and Private Ejaculations*, which was not published till after his death. In the course of a few years after his death, according to Walton, it was six or seven times reprinted; and by the time that the old angler came to write Herbert's *Life*, in the reign of Charles II., twenty thousand copies of it had been sold. It is generally ranked in that school of poetry known as the "Metaphysical," of which Herbert's contemporaries, Donne and Quarles, were in that age the most noted examples. The odes, hymns, and meditations of which it is composed, though often dashed by the quaint conceits, far-fetched analogies, and ridiculous imagery of that school, yet breathe a spirit of melting pathos, and saintly devotion, set off by so many gems of the finest fancy, that their author still holds his ground among the best religious poets of England. A stanza or two from the ode on "Virtue," will afford an illustration of Herbert's best manner:—

> "Sweet day, so cool, so calm, so bright,
> The bridal of the earth and sky,
> The dews shall weep thy fall to-night;
> For thou must die.
>
> "Sweet rose! whose hue, angry and brave
> Bids the rash gazer wipe his eye;
> Thy root is ever in its grave,
> For thou must die."

Herbert has been likened to Keble, the author of the *Christian Year*. The comparison is a just one. Both breathe a common spirit of saintly piety, and both love to present the belief and offices of their church in their most alluring and amiable aspect. The quality of the genius displayed in both is very similar, but in the matter of taste the older poet compares but ill with his modern anti-type. Herbert's chief prose work bears the title of *The Priest to the Temple*. Its purport is quite similar to that of the *Country Parson*.

There have been many editions of Herbert's poetical works. One of the most splendid is that of Nisbet, London, 1856.

Herbert, *Sir Thomas*, an English traveller of the seventeenth century, was a scion of the house of Pembroke, and was born at York about 1606. He was educated at Jesus College, Oxford, and afterwards at Trinity College, Cambridge. On quitting the university in 1621, he was attached, through the influence of the head of his family, to the English embassy which Charles I. was at that time sending to the Shah of Persia. Arriving at Ormus he travelled overland to the Caspian Sea, where the Shah happened to be. Though at first cordially received, he soon found it necessary to retrace his steps. Leaving Casbin with the survivors of the party, he returned to Ispahan, reached Bagdad, sailed down the Tigris, and then coasted along the Indian shores to Surat. Thence he set out for the Eastern Archipelago, visiting Java, the Moluccas, &c., and returned to England after an absence of four years. On his arrival he found his old patron dead, and as his hopes of preferment through his means were at an end, he set off to the continent, and on again returning home, married and applied himself to study. When the Civil War broke out he sided with the Parliament; and when Charles was delivered up to his own subjects by the Scots, Herbert was one of those whom he selected to be always near his person. For two years he waited with the most devoted tenderness on the royal prisoner, and at last attended him to the scaffold. In his *Threnodia Carolina*, published in 1678, Herbert has given a minute history of the life of the king during that period; and Charles II. showed his sense of Herbert's conduct by making him a baronet, "to requite," say the letters patent, "the good and loyal services rendered by him to the king our father during the last years of his life." Herbert died in his native city, March 1, 1682.

By far his most important work is that which he published on his return from the East, under the title of *Some Yeares Travels into Africa, and Asia the Great, especially in the Possessions of the Persian Monarchy*, &c., London, 1634. Herbert was a man of learning, and well versed in the histories of the countries he describes; but he overlays his narrative with a useless display of irrelevant knowledge, and with digressions upon countries which he never visited. These faults are peculiarly observable in the later editions of the book, and, it is suspected, may be the work of an editor. Herbert's own share in the work has an air of great truthfulness, and contains much valuable matter not readily accessible elsewhere. Till the appearance of Sir John Chardin's *Travels*, it was regarded as the best authority on everything connected with Persia. It was translated into Dutch by Jeremiah Van Vliet, Dordrecht, 1658; and from the Dutch into French by Wicquefort, who complains, and with good reason, of the stupid mistakes and mutilations perpetrated by the Dutchman.

HERCULANEUM, in *Ancient Geography*, a city on the sea coast of Campania, at the foot of Mount Vesuvius, about five miles S.E. of Naples. Its name recalls the tradition that ascribes its foundation to Hercules, which, though of course fabulous, yet indicates a very ancient origin for the town. It is most likely that Herculaneum was founded by the Pelasgi, and that at the time when it fell under the Samnite dominion, its inhabitants were a mixed Pelasgic and Oscan race, with a considerable infusion of Greek blood from the neighbouring Greek colonies of Naples and Cumæ. Under the Romans it never became a place of any great importance, and plays almost no part in history. It sided with the allies during the Social War, but was easily reduced. Its healthy situation, and the beauty of its environs, attracted many rich Romans to its neighbourhood; but even at the moment of the terrible catastrophe which has invested it with such a tragic interest, it appears to have been only a second-rate municipal town. The eruption of Vesuvius, which destroyed Herculaneum and Pompeii, took place A.D. 79; but 16 years before that date, both cities had been nearly destroyed by an earthquake so terrible as to have attracted special attention from the historians of Rome. In the great eruption, Herculaneum, being at the very foot of the mountain, seems to have been the first sufferer; and though the destruction of Pompeii was complete, yet that of its fellow-sufferer was undoubtedly more overwhelming. The depth of scoriæ and ashes under which Pompeii is buried is nowhere more than 12 or 14 feet, whereas Herculaneum lies at the depth of from 70 to 100 feet beneath the actual surface of the ground. The enveloping crust of the latter town seems to have been subjected to the action of water as it fell in molten showers on the place; for it is a hard well-compacted mass, very difficult to penetrate, and quite different from the loose scoriæ and ashes that form the grave of Pompeii. An accident led to the discovery of Herculaneum in modern times. In 1706, a peasant, in digging a well for the Prince d'Elbœuf, who had a villa in the neighbourhood, came upon some remains of antiquity, and prosecuting his researches, was rewarded with still greater success. But the matter reached the ears of the Neapolitan government, and all further excavation was prohibited. Matters remained in this state till 1738, when the search was recommenced by Don Carlos of Spain, who had succeeded to the throne of the Two Sicilies. The work was entrusted to a Spanish engineer, who carried it on with the ignorant recklessness of a Vandal, and allowed the destruction of many priceless monuments of ancient art. Since his day, however, considerable progress has been made, though the process of excavation has often been stopped from time to time from the ruin which it threatens to the towns of Portici and Resina, which stand immediately above the ruins of the buried city. Yet the whole extent of the explored parts is calculated to amount to no more than six hundred yards in length, and three hundred in breadth; but as we have al-

Herculaneum.

ready stated, many of the excavations have been again filled up with the rubbish from other parts, which could not be removed to the surface of the earth without great labour and expense.

Of the buildings as yet laid bare, the most interesting is the theatre, which seems to have possessed accommodation for 8000 spectators. It seems to have had two principal entrances, from twenty to thirty long rows of seats, and seven passages called *vomitoria*, for the entrance and exit of the people. The whole building was embellished with the varied ornaments of architecture. The flooring and pillars were of fine marble of different hues. The walls were adorned with paintings; within the precincts of the theatre were found many statues; and over the main entrance stood a triumphal car of gilt bronze with horses attached to it.

Near the theatre stood a splendid basilica, from the inner walls of which were taken the largest pieces of painting, engraved in the first volume of the *Antichità d'Ercolano*, published by order of his Sicilian Majesty. It was erected, according to an inscription, at the expense of the same Nonius Balbus who rebuilt the walls and gates of the town.

Besides this basilica, another temple has been discovered, and also the forum, some public buildings, and a number of private dwelling-houses. The forum had a colonnade, and the walls were partly cased in marble and partly painted. The private houses were small, irregular, for the most part built of brick, and one storey high. Their walls were generally covered with paintings, many of which have been cut out and removed to the royal museum at Naples. The streets that have been cleared were straight and paved with lava, like the streets of Naples at the present day. One of these was above thirty feet in width, with raised foot-paths on each side, on which were found broken columns which had evidently formed part of a colonnade. In another part of the excavations the workmen came to a vault with niches, in each of which was found a vase containing ashes, and over every niche, the name of some person coarsely painted in red letters. The vault, which was twelve feet by nine, was destitute of all decoration, and was probably the private burying-place of a family.

The treasures discovered at Herculaneum were originally deposited in the Royal Museum at Portici, but have been now removed to the Museo Borbonico of Naples. They comprise specimens of every department of art, domestic articles, and literary remains. The greatest interest, however, centred in a library containing nearly 2000 MSS., among which it was hoped might have been found some of the lost masterpieces of ancient genius. A careful scrutiny by the most eminent scientific men of the day, however, proved that it contained nothing of any material consequence. The process by which this unprofitable result was established is described in the following terms by Sir Humphrey Davy, who contributed to establish it:—

"The appearances of different rolls were extremely various. They were of all shades of colours, from a light chestnut-brown to a deep black; some externally were of a glossy black-like jet, which the superintendants called *varnished;* several contained the umbilicus, or rolling stick, in the middle, converted into dense charcoal. I saw two or three specimens of papyri which had the remains of characters on both sides, but in general one side only was written upon. In their texture they were as various as in their colours; the pale brown ones in general presented only a kind of skeleton of a leaf, in which the earthy matter was nearly in as large a proportion as the vegetable matter; and they were light, and the layers easily separated from each other. A number of darker brown ones, which, from a few characters discovered in opening them, appeared to be Latin manuscripts, were agglutinated, as it were, into one mass; and when they were opened by introducing a needle between the layers, spots or lines of charcoal appeared, where the folds had been, as if the letters had been washed out by water, and the matter of which they were composed deposited on the folds. Among the black manuscripts a very few fragments presented leaves which separated from each other with considerable facility, and such had been for the most part operated upon; but in general, the manuscripts of this class were hard, heavy, and coherent, and contained fine volcanic dust within their folds. Some few of the black and darker brown manuscripts, which were loose in their texture, were almost entirely decayed, and exhibited on their surface a quantity of brown powder." These venerable volumes were of a cylindrical shape, more or less perfect,—generally about a foot long,—and made up of the thin leaves of the papyrus plant, which were gummed together at the ends, and when thus joined formed one continuous sheet, which extended sometimes to a length of forty feet and upwards. These leaves seem to have been rarely inscribed on more than one side. The manuscript was written in a succession of parallel columns of from two to four inches in breadth, and at a distance of about an inch from each other. When completed, the entire sheet or volume was generally attached to an umbilicus or wooden cylinder, round which it was rolled.

Herculaneum.

Having got possession of this literary treasure, the next inquiry was how it was to be unsealed and opened up so as to be accessible to the learned. This was found to be a work of the greatest delicacy and difficulty; and the earlier attempts were attended with no success, but issued only in the injury or entire destruction of a considerable number of manuscripts. Among other methods tried was one suggested by Mazzocchi, an Italian of great learning, who was afterwards employed in endeavouring to supply the defects found in these recovered volumes, and in preparing them for publication. He proposed that the papyri should be placed under a glass bell, and exposed to the sun, in the hope that when the moisture which they still contained was dissipated by the solar heat, they would open up of themselves. But the experiment was a failure. The heat of the sun did indeed extract the moisture, but at the same time it either obliterated the writing, or caused the ink to spread so much that the letters became quite illegible. When thus perplexed with difficulties which they knew not how to vanquish, the work was next entrusted to Antonio Piaggi, a man of experience in the handling of ancient manuscripts, and a very skilful copyist, who was employed at the Vatican, and under his superintendence and direction the experiments were carried on with much success.

With the greatest ingenuity, and the most laudable patience and perseverance, Piaggi applied himself to the task assigned him; and as he knew of no existing apparatus that would serve his purpose, he constructed a suitable machine for himself, which was found well adapted for the end in view, and enabled him to unfold many of the papyri.

The difficulties encountered in carrying on this work were immense; and the progress made was so slow, that one is astonished that it was not soon given up in despair. Some of the manuscripts were so brittle, that they fell to pieces in the hands of the operator. The leaves of others adhered so tenaciously, that in separating the upper coil of the roll from that beneath it, so many breaks were often made in the disengaged leaf that it had the appearance of a tattered rag full of holes, and was so much destroyed, that after much care and labour had been expended, it was considered useless to proceed with it. And even when all succeeded well, the unrolling of a small portion of a manuscript was often the work of days. Yet amid these and other difficulties Piaggi persevered with admirable patience and skill, till he had succeeded in opening up a large number of the manuscripts. And as each successive part was unrolled, he took a copy of it most accurately and beautifully, with all its lacunæ and defects just as he found them, and these facsimiles were sent to Mazzocchi and his learned associates, that they might restore them as nearly as they could to their original completeness, and present them to the public. But the zeal of Piaggi was not met by a corresponding zeal on the part of his coadjutors and the Neapolitan government. His part of the work was soon accomplished; but it was not till after a wearisome delay of forty years that a specimen of these Herculanean manuscripts was published at Naples in 1793. And the work when received was little fitted to reward the patience and satisfy the expectations of the learned. It was a dull treatise on music, by Philodemus, an epicurean, in which he endeavours to show that music exercises an injurious influence on a nation, and ought therefore to be discouraged.

Soon after the publication of this volume, proposals were made by King George IV., then Prince of Wales, to bear the expense of opening and publishing some of the manuscripts. For this end he gave large sums from his private purse, procured grants from Parliament, and made all the arrangements that seemed to him most fitted to promote the success of this literary enterprise. In 1800, the Rev. John Hayter, the chaplain of the prince, was appointed to proceed to Naples, and devote himself to this work; and from the beginning of 1802 till the French invasion in 1806, when he withdrew to Sicily, it was diligently and successfully carried on. Before Mr Hayter's arrival only eighteen manuscripts had been unrolled, but in the Report which he makes to his Royal Highness of the progress made by him before leaving Naples, he says—"More than two hundred papyri had been opened wholly or in part during my stay at Naples. The experience of every day had added infinite facility and skill, with accurate and secure but rapid dexterity, to each unfolder and copyist. Hence, with these increasing advantages, every one of the remaining fifteen hundred, or as many of them as could be opened would be opened and copied, it was reasonably and universally calculated, within the space of six years at the most." Of the manuscripts that were unfolded, facsimile copies of ninety-four were sent to the Prince of Wales, who presented them to the University of Oxford. They are both in Greek and Latin, but many of them consist only of two or three pages, and are by unknown authors. Even when they are of greater extent, they are treatises of little value, and by authors of no distinction. In 1824–25, two volumes of these issued from the Clarendon Press at Oxford. They contain parts of several works by Philodemus, *On Vices, On Poems, On Rhetoric, and on Vices and their Opposite Virtues;* a work of Demetrius *On Poems,* and another *On Anger* without the author's name. These are all Greek manuscripts, and are printed exactly as they appeared when they were unrolled, with all their imperfections, and without note or comment.

Other gentlemen besides Mr Hayter were employed under the prince's patronage in experimenting on the Herculaneum papyri, and among these Dr Sickler of Hildburghausen. This individual pretended to be skilful in opening them, and without sufficient inquiry into his qualifications, he and his family were brought to London, and this delicate task was intrusted to one who proved himself totally unfit for it. The experiments were an entire failure, and resulted in the loss of several hundred pounds and the complete destruction of some finely-preserved papyri which his royal highness had procured and put into his hands. But the prince was not easily discouraged; and it is much to his honour that for so long a series of years, in the face of many difficulties, and at great personal expense, he prosecuted this undertaking with unflagging zeal. At length he succeeded in securing the active co-operation of a gentleman who was very zealous in the cause, and at the same time of great eminence both in regard to talent and scientific attainments. In 1818 Sir Humphrey Davy was commissioned by the Prince to go to Naples, and try what his knowledge of science could accomplish in devising new and more successful methods of unfolding and bringing to light the literary remains of the Herculanean library. Previous to his departure from England on this mission, Sir Humphrey had examined such portions of the papyri as he could obtain, and after subjecting them to a variety of chemical experiments and tests, was led to form a judgment regarding them quite different from what had been hitherto generally entertained. The usual opinion was, that the charred appearance of the papyri was to be ascribed to the action of fire. From this view Sir Humphrey dissented on scientific grounds. But as the supply of papyri in England was insufficient to allow him to carry on his investigations to a satisfactory extent, he readily acceded to the proposal now made to him by the Prince of Wales to proceed to Naples, and complete his experiments on this more ample field.

In the report which, on his return, was read to the Royal Society of London, and published in the *Philosophical Transactions* for 1821, Sir Humphrey gives a narrative of what he saw and did at Naples in carrying out the purpose of his mission. "The persons," he says, "who have the care of the manuscripts found at Herculaneum state that their original number was 1696, and that 431 have been operated upon, or presented to foreign governments, so that 1265 ought to remain; but amongst these, by far the larger proportion are small fragments, or specimens so injured and mutilated that there is not the least chance of recovering any portion of their contents; and when I first examined the rolls in detail in January 1819, it did not appear to me that more than from 80 to 120 offered proper subjects for experiments; and this estimate, as my researches proceeded, appeared much too high. These manuscripts had been objects of interest for seventy years; the best had long ago been operated upon, and those remaining had not only undergone injuries from time, but likewise from other causes, such as transport, rude examination, and mutilations, for the purpose of determining if they contained characters."

As the result of his experiments, he gives his opinion that the idea that attributes these different appearances of the MSS. to the action of fire, more or less intense, is entirely erroneous, that part of Herculaneum being under a bed of tufa formed of sand, volcanic ashes, stones, and dust, cemented by the operation of water, probably in a boiling state. "And there is great reason to conclude," he says, "that the different states of the manuscripts depend upon a gradual process of decomposition; the loose chestnut ones probably not having been wetted, but merely changed by the reaction of their elements, assisted by the operation of a small quantity of air; the black ones, which easily unroll, probably remained in a moist state without any percolation of water; and the dense ones, containing earthy matter, had probably been acted on by warm water, which not only carried into the folds earthy matter suspended in it, but likewise dissolved the starch and gluten used in preparing the papyrus, and the glue of the ink, and distributed them through the substance of the manuscripts; and some of these rolls had probably been strongly compressed when moist in different positions.

"The operation of fire is not at all necessary for producing such an imperfect carbonization of vegetable matter as that displayed by the manuscripts: thus, at Pompeii, which was covered by a shower of ashes that must have been cold, as they fell at a distance of seven or eight miles from the crater of Vesuvius, the wood of the houses is uniformly found converted into charcoal; yet the colours on the walls, most of which would have been destroyed or altered by heat, are perfectly fresh; and where papyri have been found in these houses, they have appeared in the form of white ashes, as of burnt paper; an effect produced by the slow action of the air penetrating through the loose ashes, and which has been impeded or prevented in Herculaneum by the tufa, which, as it were, has hermetically sealed up the town and prevented any decay, except such as occurs in the spontaneous decomposition of vegetable substances, exposed to the limited operation of water and air, for instance, peat and Bovey coal. The results of the action of heat upon the different specimens of the papyri, proved likewise that they had never before been exposed to any considerable degree of temperature." The opinion of Sir Humphrey Davy has not been universally acquiesced in. While he maintains that the papyri of Herculaneum are not carbonized, others maintain with equal confidence that they are now complete charcoal, such as is formed by heat only, and tell us that a fragment of their substance burns readily, like common charcoal, with a creeping combustion, without flame and with a slight vegetable smell, whereas Bovey coal exhibits a considerable flame.

During the two months that he was actively employed in experiments on the papyri at Naples, he succeeded in partially unrolling 23 manuscripts, from which fragments of writing were obtained, and in examining about 120 others, which, however, were too imperfect to afford hope of success.

From time to time volumes have appeared, giving to the world such relics of ancient philosophy and literature as were recovered from Herculaneum, but they were either so mutilated and fragmentary, or possessed of so little intrinsic merit, that their acquisition has afforded little satisfaction. In addition to the manuscripts published at Oxford, there have been printed some parts of a Latin poem, supposed to be by Rabirius; two books, the second and the eleventh of Epicurus, on Nature; some writings by Polystratus and Matradorus; and several other works of the same Philodemus, whose treatise on music was the first Herculanean manuscript that was published.

These manuscripts, which, with the exception of the Latin poem just mentioned, are all in Greek, are contained in eight splendid folio volumes, that have issued from the Royal Press of Naples at irregular intervals, between the years 1793 and 1844. These volumes contain not only carefully executed fac-similes of the unrolled manuscripts, but also give the conjectural readings of the *lacunæ*, with a translation and copious notes. As a specimen of the Roman characters, we take the following from Paderni:—

N·ALTERIVS·DVLC
DEM·CVRIS·CRVDE

The following from the last column of the Essay on Music, by Philodemus, will serve as a specimen of the Greek manuscripts:—

Besides these volumes devoted to the elucidation of the MSS., there is another series descriptive of the antiquities. They are entitled *Le Antichita d'Ercolano,* and, besides descriptive letterpress, give beautiful representations of the paintings, statues, busts, vases, and other works of art found within the buried city. Complete sets of these valuable works may now be found in the principal public libraries of Great Britain.

HERCULES, the Latinized form of Heracles, one of the most famous heroes of the Greek mythology. He was

Hercules || Herder.

the son of Jupiter and the Theban Alcmena, the granddaughter of Perseus; but his reputed father was Amphitryon of Mycenæ, who having accidently killed Electryon, king of that city, was obliged to fly for refuge to Thebes. There Hercules was born and brought up, and there he performed the renowned exploits of his infancy and youth, such as the strangling of the snakes, and the slaughter of the lion of Mount Cithæron. A trick of the goddess Juno condemned the young hero to the service of his kinsman Eurystheus, who, at once jealous and afraid of him, tried to procure his death, by appointing him a series of almost impossible exploits to perform. These, known as the twelve labours of Hercules, need only be recapitulated:—the slaughter of the Nemean lion, the conquest of the Lernæan hydra, the capture of the golden-horned stag of Ceryneia, the combat with the Erymanthian boar, the cleaning of the stables of Augeas, the destruction of the Stymphalian birds, the capture of the Cretan bull, the capture of the carnivorous mares of the Thracian Diomede, the successful theft of the girdle of Hippolyte, queen of the Amazons, the slaughter of Geryon and the capture of his oxen, the finding of the golden apples of the Hesperides, and the fetching up of Cerberus from the lower world. The other numerous exploits of Hercules it is hardly necessary to recapitulate—such as his expedition against Troy, and afterwards against Lacedæmon, his slaughter of the centaur Nessus, and his co-operation with the gods against the giants—or to do more than allude to his self-sought death on the funeral pyre of Mount Œta. The myth of Hercules is regarded by scholars as of purely Greek origin and development; though some of the deeds attributed to the hero have evidently been engrafted on the original story from some Oriental religion. The idea of Hercules, essentially the same in the Roman mythology as in the Greek, is that of force—that physical and mental power which enables men and communities to crush under foot all the obstacles and difficulties which nature and fate throw in their way, as they struggle onwards and upwards to a higher state of existence. (The best accounts of the myth of Hercules are given by Müller in his *Dorians*, and by Buttmann, in his *Mythologus*.)

HERCULES, *Pillars of*. See GIBRALTAR.

HERCYNIA SILVA. See HARZ.

HERDER, JOHANN GOTTFRIED VON, was born in Mohrungen, East Prussia, on the 25th of August 1744. His father, Gottfried Herder, kept in that town a female school, and performed some of the more servile duties connected with public worship in the Polish church. He was an earnest man, with a strong sense of duty, and so relied on for soundness of judgment, that his neighbours were accustomed to repair to him in matters of difficulty and dispute.

Johann received his early education in the town school, which was conducted by a teacher proverbial for his austerity. In school and out of school he was the most diligent of pupils—carrying his books with him wherever he went, and laying them aside with reluctance even at meals. If, in passing through the town, he noticed a book lying in a window, he forthwith borrowed it. When fifteen years of age he was employed as amanuensis by the pastor of Mohrungen. Considering the narrow means of his parents the pastor at first dissuaded him from study. Having chanced, however, to enter Herder's bedroom one night, and finding that the youth had been in the habit of paying nocturnal visits to his library, and occupying himself with the spoils till dawn, he encouraged him in his studies, and gave him exemption from tasks which had been imposed with the view of changing the bent of his inclinations. In this situation Herder continued for several years; and some verses which he here composed drew at the time the attention, and subsequently the patronage of a publisher in Königsberg. In his eighteenth year the surgeon of a Russian regiment which had taken up winter quarters in Mohrungen met him at the pastor's house, and was so favourably impressed with his appearance that he offered to place him at a university, and train him to the medical profession. Herder was accordingly removed to Königsberg, but as a fit of fainting signalized his *début* in the anatomy class-room, the pursuit of medicine was relinquished in favour of the more congenial study of theology. This placed it beyond the power of his patron to render him further assistance; and, left to his own resources, Herder maintained himself during his university course. He devoted the greater part of his attention to classical literature and *belles lettres*, and was permitted by Kant to attend his lectures gratis. In 1763 he became a teacher in the Collegium Fredericianum, and at the close of 1764 removed to Riga, where he had received a call to assist in the cathedral school. He was at the same time licensed to preach, and shortly after (1767) commenced his career as author with the publication of *Fragments on German Literature*. This work attracted the notice of some of the leading minds of Germany. Winckelmann wrote from Rome to Heyne:—"What new Pindar is this that has arisen amongst us?" That same year he received and refused an invitation from Petersburg to the office of rector of the Peter's school there; and the council of Riga presented him to a ministerial charge which they had created on purpose to retain his services. He was ordained, June 10, 1767. He proved an excellent teacher, and was a great favourite with his pupils; and his eloquence and earnestness rendered him as acceptable in the pulpit as he was in the class-room. He left Riga in 1769, and after some time spent, first in travelling, chiefly in France, and then in the office of tutor to the prince of Holstein, accepted the office of court-chaplain in Bükeburg and member of the highest ecclesiastical court. During his residence here he was married. He complains that the Count of Bükeburg and he did not very well understand each other, and that his situation was more nominal than real; for he was a pastor without a flock, minister of education without schools, and head of the chief ecclesiastical court without a court over which to preside.

He received, in 1771, from the Academy of Berlin, the prize offered for the best paper on the *Origin of Language*, and another in 1774 from the same institute, for a paper on the *Causes which vitiate National Taste*. In 1776 he went to Weimar as general-superintendant (an ecclesiastical office), and continued in place there till his death. Enemies had spread reports detrimental to his reputation for eloquence; but his first sermon in Weimar took all hearers by surprise, and established his fame as a pulpit orator. That city was then the residence of Göethe, Wieland, and others of the leading literary men of the day, and afforded him ample opportunities for the prosecution of his plans. He entered with vigour on the duties of his situation, and was again and again invested with new offices, till at length he was at one and the same time chief chaplain in ordinary to the duke, general-superintendent, first minister of the town church, vice-president and virtual president of the highest ecclesiastical court, and ephorus of schools. In spite of obstacles he persevered in the work of reforming schools and improving the condition of schoolmasters, until he had raised the standard and status of education throughout the duke's dominions. Amongst the prizes which he received while here, from various scientific bodies, was a third one from the Academy of Berlin for a paper on the *Influence of Governments upon the Sciences*. He died at Weimar, 18th December 1803.

Herder's own poetical productions are not now rated so high as they were on their first appearance. He is not so much regarded as having added to the poetical literature of his country, as having effected a reformation in literary effort and taste, and in this respect his merits are of the highest order. He entered upon the scene just as that crisis in the history of German literature, known by the name of the "storm and stress," was at its height. For about a century and a half the main current of German poetry, and not a little of its prose, had consisted in bald and spiritless imitations, now of Italian and English, and now of French authorship, according as the one or the other was in the ascendant. The exposure of this state of matters made by the clear and acute criticisms of Lessing, and the thoroughly original and national poetry of Klopstock, conspired at the time to unsettle the minds of the numerous aspirants to poetical fame. They had accompanied Lessing when he showed where poetry was not; they had not patience to follow him as he pointed out where it was. They made a general and indiscriminate rejection of the claims of any existing poetry to respect, and broke loose from the maxims and rules which had been founded upon it. A universal return was to be made to the first starting-point of poetry, and this time she was to keep to the proper path. But as the reformers of poetry had each his own starting-point and his own maxims, the lavish expenditure of earnestness and effort which followed resulted only in a fertile crop of whims and absurdities. At this juncture Herder stepped forward. His fine, steady sense of the beautiful, not easily blunted or beguiled, his ready perception of the presence of genuine feeling, and the vast extent of his literary acquirements, guided him to a generally correct decision as to the true poets of different countries and different times. Though not himself possessed of the philosophic acuteness and comprehensiveness of mind requisite for generalizing the principles of criticism, he could understand and appreciate them when thought out for him; and the productions which approved themselves to his own taste, coincided for the most part with those which could stand the test of the criticism of Lessing. Thus doubly fortified in his views, he prepared for action. He brought in succession, and kept steadily before the eyes of his countrymen, Moses, Homer, Shakspeare, and the old popular singers of his own and other countries; he applied to the productions of these men the principles of criticism which Lessing had evolved; he did all this in a clear, elegant, flowing style, and there was no resisting the influence of such a concentration of light. Men were aroused to a careful and intelligent study of the great models of art, and Herder continued to hold the helm, until the appearance of Schiller's *Robbers* in 1781 announced that the "storm and stress" were fairly weathered.

Of a similar kind is the service which Herder has rendered to philosophy and history. In poetry he restored the old path; here he has opened a new one. The human race, from its commencement up to the present hour, has always been parcelled out into more or less distinctly defined communities, and these communities have varied in numbers, power, wealth, knowledge, and other particulars. It is the office of history to describe the communities which have arisen at different times, the variations or changes which have taken place in their respective conditions, and the leading agents or causes by whom these changes have been effected. History, as thus understood, is simply a record of the experience of the race, and, up to the time of Herder, upon this principle history was written. The new mode of treatment which he introduced consisted in inquiring whether there are any general principles upon which the mass of facts disclosed by history can be explained. Are these facts to be regarded as no more than a series of events connected together by what may be implied in succession in time, or are they the result of a closer, though, perhaps, of a more secret—of an *organic* connection? Herder adopted the latter of these views; he named the science which investigates and unfolds it the *Philosophy of History;* and his own labours in this department are contained in his *Contributions towards the Philosophy of the History of Mankind.*

These *Contributions* constitute the only service of note which Herder rendered to philosophy, but the service was one of great value. A somewhat similar idea seems to have crossed the mind of Vico, but Herder was the first to grasp it firmly and give it a place and rank among the departments of scientific inquiry. He was so much disposed, however, to speculate—to deduce conclusions from illegitimately postulated principles, and so little disposed rigidly to deduce principles from carefully sifted facts, that his own labours in this province are of no permanent value to science, and he has long been distanced by other workers in the field which he had the honour to open. He is, moreover, too frequently inaccurate in matters of detail to be safely relied on. But we do not go to Herder for details. These defects allowed for, the work is a master-piece. To read the impressions which facts, in the main correct, left upon Herder's mind is a brisk mental stimulant; and the book merits the praise implied in the advice of Cousin, "strong men are nourished by strong books; read Herder's *Ideen*."

In the province of theology proper, Herder accomplished nothing. He had made no systematic study of it. He approached Christianity just as he had approached Homer and Shakspeare, and was occupied not so much with the substance of Christian doctrines as with the esthetics of Christian morality. As he gives no evidence of having acquired a deep practical acquaintance with Christianity, or of having made a thorough investigation of its doctrines, he cannot be fairly assigned a place in any of the classes into which those who have done either may be divided. So far as his views went, however, they were substantially Socinian. This is especially true of his later productions. In his earlier writings there is much that is useful, with good feeling and many correct views. Of this kind are his *Oldest Records of the Human Race; Letters on the Study of Theology;* and *Remarks on the New Testament, from recently opened Oriental Sources.* His works on *The Redeemer*, and the *Resurrection of Christ*, contained scarcely anything inconsistent with a chronic Socinianism. His *Letters on Hebrew Poetry* are justly celebrated as an analysis of the æsthetics of the poetical parts of the Old Testament. Herder's works are edited by Julius G. Müller, in 40 vols. 12mo. (H. M. D.)

HEREFORD, the capital of the county of that name, is situated nearly in its centre, on the left bank of the River Wye, which is here crossed by a bridge of six arches. It is of very ancient origin, and was the seat of a bishop's see as early as the year 684, a proof that it had even at that period become a place of importance. Though the city is no longer "one of the largest, fairest, and strongest castles in England," as Leland says, yet the streets, still called after the ancient gates, are remarkable for their straightness, width, and neatness. The chief edifice is the cathedral, built in 1079; it is 325 feet long, by 110 broad. In 1786 a great portion of it fell down, and it is now being restored. The other buildings are the bishop's palace, the county-hall, the county gaol (built on Howard's plan), and the markets. There are five parish churches, but none of them is remarkable for beauty. A column 60 feet high, to the memory of Lord Nelson, stands on the Castlehill, the site of the ancient castle. The city contains some remains of its earlier days—a portion of the castle-keep, one of the six gates, and the walls of some old religious edifices. Owing to its position on the frontier of Wales, Hereford has taken an important part in history. The motto of the city, "Invictæ Fidelitatis Præmium," was given to it by Charles I. as a reward for the support he received from the citizens. Hereford has returned two members of parliament since the 23d of Edward I.; it was incorporated in 1189 by Richard I., and is now governed, under the Municipal Act, by a mayor, six aldermen, and eighteen councillors. Market-days, Wednesday and Saturday. Pop. in 1811, 7306; in 1831, 10,282; and in 1851, 12,108.

HEREFORDSHIRE, an inland county of England, on the borders of South Wales. It is bounded on the N. by Shropshire, N.E. by Worcestershire, N.W. by Radnorshire, W. by Brecknockshire, S. by Monmouthshire, and S.E. by Gloucestershire. The county is circular in shape, indented in some places by spurs of the adjoining counties; and it had several detached parts, but each of these was incorporated by the Act 7th and 8th Will IV. with the county in which it was situated. The greatest length of the county is, from near Ludlow to near Monmouth, 40 miles; and the greatest breadth, from the foot of the Malvern Hills to Clifford, 35 miles. The area of the county, according to the census commission, is 534,823 statute acres. It is divided into 11 hundreds, and 221 parishes; and it is a bishop's see.

The soil of the county is generally a mixture of marl and clay, but contains calcareous earth in various proportions in different parts. Towards the western part, the soil is tenacious, and retentive of water; the eastern side is principally a stiff clay, in some places of a red colour. In the south, some of the soil is a light sandy loam. The subsoil is almost universally limestone; in some parts the old red sandstone, and a species of marble, beautifully variegated with red and white veins, and capable of receiving a high polish. When the soil does not rest on limestone, as near the city of Hereford, it is sometimes a siliceous gravel, and occasionally fuller's earth and yellow ochres are found. The surface is highly picturesque. It may be described as a rich plain, undulating in long ridges, as if it had been rippled by a subterranean convulsion. Coppices of ash and oak clothe the sides of the hills, and fringe their crests; and the low lands are wooded by pear and apple trees, grouped in orchards, and scattered over the fields. Whether in May, when the fruit trees are white with blossom, or in September, when they are laden with yellow fruit, the county deserves its title of "The Garden of England."

The county is purely agricultural, and at the commencement of the century stood second amongst the agricultural counties of England. It produces wheat and barley of fine quality; indeed "Lemster bread" and "Weobly ale," were famous as early as the days of Camden. Hops and cider are among the staple products of the county. The hop vines, unlike the method practised in Kent, are planted in rows, and the soil is ploughed. The orchards are planted in every kind of soil, and without regard to aspect; but it has been ascertained that a western aspect is the least favourable, as the westerly winds, sweeping over the Welsh mountains, bring cold, fog, and what is termed "blue mist." The crops of apples, generally large, is enormous every fourth year, and very often the branches of the trees would break down under the weight of produce, if they were not propped up. As much as twenty hogsheads of cider have been made from a single acre of orchard, but the average yield is twelve hogsheads an acre. Much fine timber is grown in the county, and many a spreading oak which has sheltered and adorned these inland fields, aids in forming the sides of the noble war ships which bear the British flag throughout the world. A large quantity of bark is stripped annually.

Herefordshire is famous for its breed of cattle. The breed is athletic in form, and of a bright-red colour, with white, or mottled faces, and remarkably silky hair. The Hereford cattle produce the finest beef; yet they feed more cheaply than the Devon or Durham cattle. The county was at one time famous for a small white-faced breed of sheep without horns, known as the Rylands sheep, from the district in which they were chiefly bred. The characteristic of the breed was the silky pile and delicate texture of the fleece; but in crossing the Rylands sheep with the Liecesters, to make them more robust, the fleece has been deteriorated. Indeed, the original Ryland breed is nearly extinct, at least in the pure form; it has been succeeded in the upper part of the county by Shropshire downs, and in the lower, by the Cotswolds, with their various crossings. The horses used in the county are generally of a good stamp, especially in the northern part, where they are reared for the saddle and coaching in other parts of the kingdom.

Herefordshire has made great progress in farming during the last twenty years. Turnip and green crop husbandry, with the consequent improved rotation of crops, is now the general practice. The average yield of wheat may be safely estimated at from 28 to 30 bushels an acre, whilst in an important district, of which Ross may be considered the centre, and where the old red sandstone formation predominates, a yield of 40 bushels is by no means extraordinary, and in some instances even 50 bushels have been obtained. The stiff tenacious clay in other parts of the county resists improvement, and has disappointed the hopes of many enterprising agriculturists; but, nevertheless, even in those parts, there is a very marked difference in the results of farming at the present time as compared with those of a quarter of a century ago. Generally speaking, the farming of the county will bear comparison, not indeed with every county, but with England and Scotland as a whole. Many of the breeders of cattle in this county are famous throughout the kingdom for the number, size, and excellence of the animals with which they regularly supply the metropolitan and other markets. Two agricultural exhibitions, and several fairs are held in the year at Hereford, and at each of them the quantity of fine cattle driven in for show and sale, fills every street of the city, and excites the admiration of judges from all parts of the kingdom.

There are no manufactures, properly speaking, within the county. The excellence of the wool has stimulated attempts to make woollen goods at Hereford, but they have failed. Some coarse woollens are made at Leominster and Kington, but the quantity is very small.

The climate of the county is good, though variable. It is more rainy in this county than in the more eastern parts of England, and at times there are damp fogs, which moisten the earth, and may be one cause of its great verdure. We learn from the Registrar-General's report, that diseases of the respiratory organs are unknown in the county, and that it ranks high in point of longevity. Fuller says that in his time, "many aged folk, who in other counties are properties of the chimneys or confined to their beds, are here found active in the fields." An amusing instance of the salubrity of the climate, and the stamina of the people, was given by Sergeant Hoskins when King James I. visited the county; he assembled ten women of the united age of 1000 years, who danced the morrice dance for the entertainment of his Majesty.

The rivers of the county are the Ledden, the Lugg, the Arrow, the Frome, and the Wye. The Ledden rises at Hadlow and flows by Ledbury into the Severn near Gloucester. The Lugg rises in Radnorshire, enters the county on the N.W., and flows by Leominster and Hereford into the Wye near Mordiford. The Arrow also rises in Radnorshire and flows by Kington and Monkland into the Lugg. The Frome rises in the N.E. of the county, and also flows into the Lugg at Mordiford. The far-famed Wye—"thou wanderer through the woods"—enters the county near Clifford Castle, the birth-place of Fair Rosamond, flows by Hereford and Ross, and traverses in many a bold and silvery curl the whole breadth of the county. Though all the other streams, except the Ledden, are tributaries of the Wye, it is for all practical purposes an inconsiderable river. Its sinuosities have created sandbanks and rapids, and it is liable to sudden floods, owing to the large and mountainous surface which it drains. The Wye is navigated by barges within this county; these are towed by men whose efforts in the difficult parts of the stream are painfully laborious. Attempts have been made to substitute horses for men, but the latter have successfully resisted the innovation, content to labour as mere beasts of burthen. The Wye is famous for its salmon; and in former times, the fish were so abundant that the apprentices of Hereford were protected by a special clause in their indentures, from being compelled to eat salmon more than twice a-week. The clause is quite unnecessary now, Wye salmon, owing to its scarcity, having become a delicacy even at the tables of the rich. The Wye, as we have already stated, is imperfectly navigable; but when moderately swollen by rain, heavily laden barges are tracked up, or shoot down with the current. The Lugg is also navigated by barges between Mordiford and Lugwardine-bridge, a short distance. The remaining means of inland navigation consist of a canal from Hereford to the Severn near Gloucester; and another canal from Leominster to the Severn at Stourport. Hereford is the terminus of three lines of railway, one connecting it with Shrewsbury, Gloucester, and Newport, on the Bristol Channel; and another line to Worcester is projected.

The earliest known inhabitants of Herefordshire were the Silures. Under Caractacus, the Silures resisted the Romans so obstinately, that the Emperor Claudius commanded that a war of extermination should be made against them. The Silures were the last people of Britain who submitted to the Saxons. The Danes sailed up the Wye in the year 912, and seized the Bishop of St David's, who then resided at Archenfield; and King Edward paid L.40 (a great sum in those days) for the bishop's ransom. The Normans conquered the county without much difficulty, and colonized it in order to repel the incursions of the Welsh. For many centuries Herefordshire was separated from Wales by a tract of land called the Marches, a kind of debateable ground, alternately possessed by the English and Welsh, but at length incorporated with the county in the reign of Henry VIII. In the wars of the Roses, Herefordshire took up arms for the House of York; and an army of 25,000 men, raised in the county, totally defeated the forces of Edward VI. at Mortimer's Cross, near Leominster. During the battle three suns appeared in the sky, a rare phenomenon in this country, though common in the Alps and other mountains; and in consequence, Mortimer took a sun for his crest. In the Parliamentary struggle Hereford sided with the king, and was thrice besieged; twice it surrendered to the Parliamentarians, but it resisted the Scotch.

The antiquities of the county are numerous and highly interesting. A line of Roman and British entrenchments extends from the Malvern Hills to Conwall Knoll. A British earthwork of great strength is known as the Herefordshire beacon. Offa's Dyke, a great ditch 100 miles long, may still be traced in many parts of the county. It was cut by Offa the Saxon, to check the incursions of the Welsh, who had continually harassed the kingdom of Mercia, of which Herefordshire formed a part. The Roman road called Watling Street traverses the county from Leintwardine to Longtown, thence passing into Monmouthshire; a second Roman road enters the county from Gloucester at Ross; and a third enters the county from Worcester near Frome and terminates at Kenchester. Several of the baronial castles, with which the county was thickly studded in earlier times, still exist in a ruined state; chief amongst them are Bredwardine, Clifford, and Goodrich. There are also some remains of the stately ecclesiastical edifices which formerly adorned the county, but the work of destruction has been so thoroughly done, that their ruins exhibit few features of interest.

According to the religious census of 1851, there were in the county 426 places of worship, having in all 69,575 sittings. Of these places of worship, 243 were Church of England, 20 Independent, 16 Baptist, 120 Methodist, and 5 Roman Catholic. The educational census gives 489 public day-schools, with 41,295 scholars; and 794 private day-schools, with 14,923 scholars.

The population was, in 1821, 336,190; in 1831, 387,398; in 1841, 431,495; and in 1851, 458,805. This is a sparse population as compared with that of the adjoining counties.

Herefordshire is represented in parliament by seven members—three returned by the county, two by the city of Hereford, and two by the borough of Leominster.

The towns of the county are Hereford, Leominster, Ledbury, Ross, Bromyard, and Weobly. The towns in Herefordshire are generally worse built than in any other English county, and more nearly approach to those of their adjoining Welsh neighbours. In the villages the buildings are still worse. (F. C.)

HERENCIA, a town of Spain, province of La Mancha, is the centre of a prosperous and fertile district. The soap which is manufactured on an extensive scale in the town is highly celebrated, and is exported in great quantities to all parts of the world. Pop. 7150.

HERESY. It is not our intention under this head to discuss the character and tendency of heresy as an ecclesiastical question, nor to give an account of the several forms of belief which have from time to time been denounced as heresies. The more conspicuous and important of these will be found under the several titles which they bear in ecclesiastical history. The object of the present article is merely to give a brief notice of the civil effect which has generally been given to that departure from established modes of faith to which the term applies. It never included infidels or persons professing a different religion from the Christian, such as Jews or Mohammedans. These were dealt with by separate laws. True to its etymological origin (ἁιρεσίς, choice or selection), heresy was the offence of those who, professing to be Christians, used the right of private judgment, and chose their own form of Christianity, instead of conforming to the declared will of the Church. From the days of Constantine downwards, the imperial power treated any departure from the imperial established religion as a public nuisance which must be suppressed. The fifth title of the first book of the Justinian code contains a series of the laws so passed from time to time against heretics described as people who, at the instigation of conceit or waywardness, set up doctrines for themselves, and endeavour to break free from the control of the Catholic Church. The offence was punished by the secular arm as an interruption of the imperial policy, and a disturbance of the public peace. As the companion of catholic unity, the arrangement was one of perfect theoretical simplicity. The general councils established the doctrines of the Church, and those who preached or taught against them were guilty of a public offence, for which they were punished by death or some minor infliction, according to the severity or leniency of the criminal code of each country. But even during the professed continuance of catholic unity, this simplicity was more theoretical than practical. The early councils were enabled, it is true, to draw a broad line of demarcation between the belief of the church and the doctrines of certain heretical sects, because the condemnation of these sects was sometimes the chief business discussed by the council, and the triumphant majority clearly defined the opinions which they repudiated. But in later times when the voice of general councils was no longer so specifically announced, and the Catholic Church, spread over all Europe, was influenced by national habits and institutions, the opinions which constituted heresy fluctuated according to local conditions. Hence, independently of the conflicts connected with the great question of preserving the Catholic Church from the large innovations of the reformers, minor heresies sprung up according to local conditions and conventionalities, creating that long array of secondary persecutions with which the annals of Christendom are unfortunately crowded. In the countries which adopted the Reformation, even the name of a catholic unity from which it was a crime to secede, no longer existed. Yet if we except some imperfect glimmerings of the principle of toleration in Britain, Holland, and a part of Germany, it seems never to have been thought of, even by the reforming communities, that the state was no longer to punish as a crime all divergence from the mode of faith established by the preponderating power. In France, where after a long conflict, the edict of Nantes established Protestantism side by side with Catholicism, neither party acknowledged the principle of toleration, and the Huguenots were no less jealous than their opponents in preserving their ranks from the taint of heresy. The arrangement was in fact a treaty between two hostile powers occupying the same soil; and like two armies which agree to suspend warlike operations, each kept its own ranks in discipline, and punished desertion.

In looking on heresy as a sort of offence against the public peace, the continental states generally permitted the ecclesiastical judicatories acting under the canon law to fix its character, and even dictate its punishment. The feeling of the feudal princes on the subject is characteristically expressed in a constitution of the Emperor Frederick I., which decrees that, if the temporal lord, when duly admonished and warned by the Church, shall neglect to purge his territory of heretics, his feif shall be forfeited and pass into the hands of faithful followers of the Church, that they may free it from pollution. In England no effect was in the general case given to either the canon or the civil law in the shape of punishment; and heresy, like other offences, was the creature of statute. By an act of the 5th of Richard II., passed in 1382, commissions were issued for the apprehension and imprisonment of such as were certified by the prelates to be preachers of heresy, with their favourers, maintainers, and abettors. It is singular that Mr Hallam mentions this statute as one of those instances where the commons complain that a law was passed by the crown without their consent (*Mid. Ages*, pt. iii., chap. 8). The 2d of Henry IV., passed in 1400, is the earliest act which condemns heretics to be burned. It has been remarked, that it is drawn up in Latin, while the other acts of the same session are in French, and that it is a precise echo of a petition by the prelates and clergy;—hence it may be inferred, that while it was the practice in general for the crown to pass acts on the petition of parliament, this particular act was granted on the application of the Church. Notwithstanding the jealousy with which the English law protected the subject from penalties not authorized by parliament, it has always been maintained that the writ for burning a heretic, *de hæretico comburendo*, was issued, on application by the proper ecclesiastical authority, by the sole prerogative of the crown; and lawyers have been in use to observe apologetically, that the writ was not issued as of course, but required the special authority of the king in council (Blackstone, b. iv., chap. 4). There is, however, some reason to believe, that the writ is no older than the act of Henry IV., and thus has its origin in statute (see notes on the statute in Tomlyn's edition). Several other cruel acts against heresy were subsequently passed, but the climax both of severity and confusion was reached by the act 31st of Henry VIII., "for abolishing of diversity of opinion," which established the six articles of faith so well known in history, and appointed death by burning as the punishment of transgressing the first, and death in the ordinary penal form, as the punishment for transgressing any of the others. The celebrated first act of Elizabeth, abolishing the authority of the see of Rome in England, did not mitigate the punishment of heresy, but enacted, that no opinion should be punished as heresy, unless it had been "heretofore determined, ordered, and adjudged to be heresy by the authority of the canonical Scriptures," or was so determined by one of the four first general councils, or by parliament, with the consent of convocation. The law by which heretics were liable to be put to death by burning, was not abolished until the year 1676 (29th Car. II., c. 9).

Much interest has lately been created in England by the question, how far the Established Church can exclude clergymen, adjudged by ecclesiastical authority to be maintainers of heretical doctrines, from ecclesiastical rank and emoluments? In Scotland the right of the judicatories of the establishment to depose a minister for heresy or any other purely ecclesiastical offence is not doubted; and the courts of law have only interfered with proceedings of this nature, when it has been maintained that they were not founded on strictly ecclesiastical grounds, but were held for the purpose of accomplishing some ulterior object. In England the supremacy of the crown has enabled the temporal power to consider the ecclesiastical grounds on which any effort to affect the right to the temporalities of the Church has been based; and the discontinuance of the convocation, by withdrawing corporate action from the prevalent majority in the Church, has decidedly favoured this limitation of the powers of ecclesiastical judicatories. In the instance known as the Gorham case, decided in 1850, the Bishop of Exeter refused, on account of what he counted heretical opinions, to institute to the vicarage of Bramford-Speke, the Rev. G. C. Gorham, presented by the crown. The bishop's refusal was confirmed by the Dean of the Arches Court of Canterbury. Mr Gorham appealed to the Queen in council; and the judicial committee of the privy council entering into the whole question, whether the presentee's opinions justified the bishop's refusal to institute, decided as a court of law in favour of Mr Gorham. (J. H. B.)

HERETOCH (Saxon, *here*, an army, and *togen* to lead), a name applied in Saxon times to those who were elected by the folkmote, or "full assembly" of the people to conduct the armies of the kingdom.

HERFORD, or Hervorden, a walled town in Prussian Westphalia, capital of the circle of Minden, at the confluence of the Werra and Aa, 16 miles S.W. of Minden. It has six churches, a gymnasium, industrial school, arsenal, prison, and museum for Westphalian arts and antiquities. Its manufactures comprise cotton and cotton-yarn; also linen, leather, tobacco, and ale. Pop. (1849) 6756.

HERIOT, in *Law*, a customary tribute of goods and chattels payable to the lord of the fee on the decease of the owner of the land. See Copyhold.

HERISAU, a town in Switzerland, capital of Ausser-Rhoden, at the confluence of the Glatt and Brülhbach, 7 miles N.W. of Appenzell, 2334 feet above the sea-level. The town is very irregularly built. The church tower is the oldest building in the canton, and is supposed to have been built in the 7th century. The archives are kept in this tower. Herisau has a public library, court-house, arsenal, and an orphan asylum. The neighbouring heights, two of which are crowned with the ruined castles of Schwanberg and Rosenberg, afford beautiful walks. It has important cotton, muslin, and silk manufactories, and carries on an extensive trade. The baths of Heinrichsbad are a mile distant. Pop. 2700.

HERMANN, Johann Jakob Gottfried, a celebrated Greek scholar of Germany, was born at Leipzig, November 28, 1772. He studied law and philosophy at Leipzig and Jena. In 1794, he began his course of lectures on ancient literature in Leipzig, was made professor of eloquence in 1798, and of poetry in 1809. He died in 1848.

Though destined for the study of law, yet, under Professors Ilgen, Beck, and Ernesti, he acquired the predilection for classic literature which afterwards rendered him famous. He set himself to revise thoroughly the classic metres and the Greek grammar. In the prosecution of this task he published a great many editions of classic authors. The principles which he entertained regarding the classic metres, were published in his work *De metris poetarum Græcorum et Romanorum* in 1796; and in his *Handbuch der Metrik* in 1799. These were drawn up in a more complete form in his *Elementæ doctrinæ metricæ* in 1816, of which his *Epitome*, &c., appeared in 1818.

He extended his literary reform to the study of the Greek grammar and his work *De emendendâ ratione Græcæ grammaticæ*, was published in 1801. As this treated of accentuation and the analysis of letters, Hermann gave his views on syntax in the shape of notes, and extensive additions to Vigier's work *De præcipuis Græcæ dictionis idiotismis.* He has been accused of viewing the ancient classics too exclusively from the stand-points of grammar and criticism; still his views, both medical and grammatical, have been extensively adopted throughout Europe.

His editions of the classics are:—Æschylus and Euripides, complete with Latin notes, 1798. The *Eumenides* of Æschylus and *Clouds* of Aristophanes, with introduction, commentary, and scholia, 1799. *Hecuba* of Euripides, with the notes of Porson and Wakefield as well as his own; and the *Trinummus* of Plautus, in 1800. The *Poetics* of Aristotle, with Latin translation, commentary, and disquisitions, in 1802. The *Hymns* of Orpheus in 1805, and those ascribed to Homer in 1816. The *Hercules Furens* of Euripides, 1810. The *Suppliants* of Euripides in 1811. The *Medea* of Euripides, 1822. The *Alcestis* of Euripides in 1823. The unfinished edition of *Sophocles* by Erfurdt, was completed by Hermann in 7 vols. in 1825. The *Ion* of Euripides in 1827. The *Opuscula* of Hermann, begun in 1827, is a collection in 6 vols., of literary and scientific articles from German publications.

HERMANNSTADT (the Hungarian *Nagy-Szeben*, the Wallachian *Szibin*, the Roman *Cibinium*), a town of Hungary, capital of Saxon-land, in Transylvania, on the Zibin, near the Wallachian frontier, 72 miles S.E. of Klausenburgh; N. Lat. 45. 47.; E. Long. 24. 10. It is the seat of the highest tribunal in the province, the residence of the governor, the see of a Greek bishop, and head-quarters of the military commandant of Transylvania. The town, surrounded by a double wall and deep ditch, has five gates, and is divided into two parts, the upper and lower. The connexion between the two is kept up by flights of stone steps. The old citadel stands in the upper town. The houses are Gothic, and regularly built, and the streets, though narrow, are clean. It has a square in which are a fountain and statue. The important buildings are,—the Brückenthal palace, which contains a public library of 15,000 vols., picture gallery, and museums of medals and antiquities; the Lutheran cathedral, Gothic town-hall, barracks, hospital, and numerous churches. In the Lutheran gymnasium, divinity, law, and philosophy are studied. The manufactures of Hermannstadt are linen and woollen stuffs, hats, leather, and ropes. It has also paper and powder mills; but its trade has declined. The Carpathian Mountains in the vicinity afford fine views. Pop. 20,000.

HERMAPHRODITE (Ἑρμης *Mercury*, and Ἀφροδιτη, *Venus*), a term applied to a human being possessed of the characteristic organs of both sexes. In the human subject, one or other of the organs is rudimentary. Amongst the *invertebrata* hermaphroditism is a reality, and occurs most frequently in the mollusca and radiata. In vegetable life it is the normal condition. A flower is termed hermaphrodite when it contains stamens and pistils within the same calyx and petals. See Botany.

HERMAS, one of the Christians to whom Paul addresses a salutation in the end of his Epistle to the Romans. By some he is regarded as the author of an apocryphal book called the *Shepherd*, from having been dictated to the writer by an angel in pastoral dress. With the exception of a few fragments in the original Greek, this work exists only in a Latin version. In the very earliest ages its canonicity was regarded with suspicion; but from its taint of superstition and absurdity, it is wonderful that it should ever have been received with approbation. It is to be found in editions of the Apostolic Fathers, and has been translated by Archbishop Wake. The authorship of the book is by others attributed to a brother of the Roman Bishop Pius (A.D. 140), or to one of the seventy-two disciples who is said to have been bishop of Philippopolis.

HERMENEUTICS, the science of exposition, generally applied as a theological term to the exposition of Scripture.

HERMES and Hermæa. See Mercury.

HERMETICAL SEALING, a manner of completely closing glass vessels, for chemical operations, by heating the neck of the vessel in the flame of a lamp till it be ready to melt, and then twisting it close.

HERMIANI, also called Seleuciani, a sect of heretics in Galatia, who held the corporeality of God, and the creation of souls by the angels from water and fire. They rejected baptism, and regarded immortality as simply the transmigration of the souls of the dead into the bodies of the newly-born.

HERMIT, or Eremite (ἐρημος, a desert), one who lives in a desert, or passes his life in solitude. Hermits were distinguished from anachorets or anchorets, in that the former ranged at liberty abroad in the world, while the latter isolated themselves, not only from the abodes of other men, but from the cells of similar devotees. Thus, a hermitage was, in ancient times, often surrounded by a *laura*, or collection of isolated cells where the anchorets lived alone.

HERMOGENES, an African painter, who in the second century projected a system of mingled Stoicism and Christianity. One of his pupils was Seleucus, the joint founder of the Hermiani mentioned above.

Hermogenes, *Tarsensis*, an eminent Greek rhetorician, born at Tarsus about the middle of the second century A.D. He was surnamed *Xyster*, from the great value which he attached to *polishing* in composition. While only about fifteen years of age he attracted the attention of the Emperor Aurelius, and became professor of rhetoric at Rome. His brilliant career was terminated at the early age of twenty-five, not by death, but by a weakening of his faculties, which reduced him very nearly to the condition of an idiot. In this state he lived to an advanced age. His great work on rhetoric is divided into five parts:—1. Rhetoric as applied in the courts of justice. 2. The conduct of a discourse as to introduction, plan, argument, &c. 3. On style. 4. Hints for the practical application of the rules relating to style. 5. The use of models in rhetoric. The last, in the abridged form, was translated into Latin by Priscian.

This work of Hermogenes became popular in the schools; many commentaries and abridgments were made of it, but it maintained its ground till supplanted by the abridgment of Aphthonius. The original work was well illustrated by examples from the best writers; and though traces of the youthfulness of the author are discernable, yet it is temperate, perspicuous, and free of conceits. His other works have perished.

HERMON, a mountain belonging to Anti-Libanus, and forming the northern boundary of the country conquered by the Hebrews from the Amorites. It is the Sirion of the Sidonians, the Shenir of the Amorites, the Jebel Es-skeikh or Old Man's Mountain of the present day. It is considered the highest of the Lebanon range, and the snow is perpetual, at least in the ravines, though sometimes even in midsummer the upper part is quite covered with snow. Some have imagined, from certain passages in Scripture, that there must have been another Hermon near Tabor, but this is improbable.

HERMOPOLIS MAGNA (now *Eshmoon* or *Ashmouncm*), a city of Heptanomis or Middle Egypt, on the left bank of the Nile, in N. Lat. 27. 50., E. Long. 30. 53. Owing to its frontier position with reference to Middle and Upper Egypt, the ancient Hermopolis was a place of importance, second only to Thebes. The portico, still remaining, of a magnificent temple has attracted the notice of travellers. It consists of twelve pillars, each 40 feet high, in two rows of six to each row, painted with bands of blue, red, and yellow. These pillars are composed of irregular masses fitted together—a peculiarity of extremely rare occurrence in Egyptian architecture. The ruins of Hermopolis have been greatly destroyed by the Mohammedans, who have used them for building purposes.

HERMUS, now the SARABAT or KEDOUS, in *Ancient Geography*, a river of Asia Minor, which, rising among the hills that separated Phrygia from Lydia, flowed due E. through the latter country, which it divided into two nearly equal parts, and fell into the Gulf of Smyrna. On its northern bank it received the Hyllus, and on its southern the Pactolus, both of which tributaries, like the river itself, were often celebrated by the poets of antiquity. In fact, all these streams derive their chief importance from their poetical associations.

HERNE BAY, a village in the county of Kent, 8 miles N.N.E. of Canterbury, on the estuary of the Thames. It has recently come to be much frequented as a bathing place, and as a consequence, hotels, villas, assembly rooms, libraries, &c., are rapidly springing up. It has a pier upwards of three quarters of a mile in length, which forms a pleasant promenade. Pop. of parish (1851), 3094.

HERNIA, from ἔρνος, a branch, is a term applied to several surgical complaints, of which the characteristic symptom is that a part of one of the organs of the body protrudes through some aperture. Hence when the brain protrudes through an aperture in the skull it is styled a *hernia cerebri.* Most commonly, however, the term is limited to a protrusion of the bowels through some aperture in their containing walls, the integument still remaining entire; and though this protrusion may occur at almost any part of the abdomen, it does so most frequently through those apertures which naturally exist for the transmission of vessels. These natural apertures are the umbilicus, and the inguinal and femoral canals. Hence hernia tumours which occupy these apertures are named umbilical, inguinal, and femoral herniæ. As herniæ, when not congenital, are generally the result of violent exertions, as from lifting heavy weights, leaping, violent fits of coughing, &c., and the patient at the moment experiences a sensation as if some part of the bowels had been ruptured, the disease in common language is significantly styled a *rupture.* In all cases the bowel pushes before it a portion of the peritoneum, the smooth membrane which lines the cavity of the abdomen, and this membrane constitutes the *sac* of the hernia.

Umbilical hernia is almost always congenital, or makes its appearance shortly after birth. If there be no malformation, and means are used to reduce the protrusion and prevent its recurrence, a cure of this form of hernia may in general be easily effected, as the aperture through which the protrusion occurs has a natural tendency to become obliterated. But if means be neglected in infancy the complaint remains for life. A halfpenny or a slice of cork enveloped in chamois leather, and fixed over the umbilicus by means of a broad strap of adhesive plaster, after the hernia is reduced, is the best mode of treating the complaint. A conical compress, recommended by many, is objectionable, as it tends to prevent the natural obliteration of the aperture, and is apt to render the complaint permanent.

Inguinal Hernia. The vessels of the testicle in the male, and the round ligament in the female, proceed through the parietes of the abdomen at the groin in an oblique canal about 2½ inches in length. This canal has consequently an upper aperture or *ring*, where the vessels enter it, and a lower *ring*, where the vessels leave it. These two points, then, are probably the weakest parts of the walls of the abdomen; and on any unusual strain a knot of bowel or of omentum is apt to be forced either into the upper aperture and down the course of the vessels, or directly through the lower or external ring, where the vessels leave the canal. If the tumour remains small, and is confined to the groin, it is termed a bubonocele; but if large, as it usually is when congenital or of long duration, and distends the scrotum or labium, it is termed a scrotal or pudendal hernia. Inguinal hernia is often congenital in the male, in consequence of the aperture not having become obliterated through which the testicle descended to the scrotum; and from the much larger size of the inguinal canal in the male this form of hernia is very much more common among males than among females.

Femoral Hernia is constituted by the viscera protruding through the space between the femoral vessels and the crescentic margin of the crural arch. In consequence of the breadth of the female pelvis, and the consequently larger size of the femoral aperture, this form of hernia is much more common in females than in males.

All the forms of hernia are met with in three states:—1st, *Reducible*, in which the tumour may be pressed back into the abdomen, when it disappears with a gurgling noise. 2d, *Incarcerated*, in which the viscera have contracted adhesion to the sac, and cannot be pressed back into the abdomen, but the person suffers no particular uneasiness. 3d, *Strangulated*, in which the viscera in the hernial tumour are subjected to such an amount of constriction that their functions are impeded, when violent and dangerous symptoms arise, which, unless speedily relieved, end in mortification and death. All forms of hernia are apt, from special causes, to end in strangulation; hence the existence of hernia is always looked on with suspicion, as rendering life more than usually hazardous.

When a hernia occurs the person should be laid in the horizontal position, and pressure should be so applied to the tumour as to induce its return to the cavity of the abdomen. The effect of this external and scientific application of pressure—the *taxis*—is frequently aided by warm baths, blood-letting, the administration of tartar emetic, or tobacco enemata, with the view of inducing relaxation of the ring which prevents the return of the bowel, or of inducing collapse of the protruded bowel. Ice and ether are also sometimes applied over the tumour with the same view. If the taxis fails, and urgent symptoms arise, as constant vomiting, redness, swelling, and excessive pain in the tumour, high fever, &c., a surgical operation is required to relieve the strangulation, else rapid mortification of the tumour may occur, and death ensue within a few hours. In all cases, after the hernia is reduced, a pad with a bandage, or *truss*, must be applied and constantly worn, that by pressing on the aperture through which the bowel descended a recurrence of the protrusion may be prevented. (J. S—K.)

HERNICI, an inland tribe of Italy, apparently of Sabine origin, inhabiting that part of Latium which was bounded on the N. by the Æqui and on the S. by the Volsci. They seem to have been at first on friendly terms with Rome, but after the great Gallic invasion they joined the Æqui and Volsci against their former friends. Their rebellion was at first successful, but their capital, Ferentinum, at length fell into the hands of the foe, and they were compelled to acknowledge the Roman supremacy. They obtained, however, such favourable terms that in the general rebellion of the Latins, B.C. 340, they remained faithful to their allegiance. At the end of that same century they again appear in arms against Rome, but there was no unity of action among them, and they were easily subdued. Such of their cities as had refused to countenance this rebellion were allowed to retain their own laws and magistrates. Anagnia and the other towns that had held out were presented with the honorary civitas of Rome, and reduced to the condition of præfecture. After this date the Hernici disappear from the political history of Italy. Their chief towns, besides Anagnia, were Ferentinum, Verulæ, Aratrium, and perhaps Trebia. The country of the Hernici, lying along the upper course of the Trerus (now the Sacco), is described by Virgil as the *Roscida rivis Hernica Saxa.* Besides being well watered with countless streams, it contained magnificent woods of chestnut and oak trees, making it in all one of the most picturesque and delightful nooks of the Apennine range.

HERNOSAND or **Wester Norrland**, a län of Sweden, lying chiefly between N. Lat. 62. and 64. and E. Long. 15. and 19., and bounded on the N. by Umea, W. by Ostersund, S. by Gefle, and E. by the Gulf of Bothnia. Its greatest length along the coast is about 140 miles, and its breadth varies from about 20 to 100. Area about 9500 square miles. Hernosand presents an extremely varied surface. Its elevations, frequently steep and rocky, and generally for the most part covered with trees, its deep and narrow valleys, with rapid and winding rivers, and its fine mountain lakes, all conspire to render it superior to most if not to all the other läns in Sweden. The chief products, besides corn, which is scantily grown, are deals, tar, and some iron. The principal branch of industry is the manufacture of linen, which is extensively carried on, the spinning being done by both sexes during the long winter nights. The rearing of cattle receives some attention. Pop. (1850) 99,558.

Hernosand, the capital of the above län, stands on the W. side of the island of Hernön, at the mouth of the Angerman River, but connected with the mainland by a bridge. It is the see of a bishop, and has a gymnasium, library, public baths, and building docks. The harbour is excellent, and a considerable trade is carried on. Pop. about 2200.

HERO. The story of Hero and Leander is one of the best known in the whole mythology of Greece. The myth, in its simplest form, is as follows :—Hero was a priestess in the service of Venus at Sestos, and her lover, Leander of Abydos, used nightly to swim across the strait of the Hellespont to pay his court to her. One stormy night he was drowned, and in the morning the billows washed his body ashore to the feet of his betrothed, who, when she saw it, threw herself into the sea, and perished by the same fate as her lover.

Hero. This term was of somewhat indiscriminate application. It was applied to those who were partly of human, partly of divine origin, or to men who did illustrious actions for the benefit of mankind. Homer applies it to the whole of the Grecian army, and sometimes to individual heralds. The warriors who took part in celebrated sieges and battles, such as Troy and Marathon, were called heroes. Etymologically, the word indicates the possession of extraordinary strength and courage, and is supposed to be connected with the Latin *Vir*, and the German *Herr*. This points naturally to the leadership or mastery which results from the possession of superior courage and strength. It is said that this etymology can be traced in the designation of the body from which sprang the military adventurers of the Lombards. In the same way the primitive heroes may have been the leaders who particularly distinguished themselves amongst the wandering hordes who sought new settlements in different parts of Greece. The heroic age is variously estimated at six centuries between 1800–1200 B.C., or six generations terminating at the same epoch, that is, about the time of the Trojan War. The heroic age was certainly past when Hesiod wrote.

In after times the reverence with which the heroes were regarded assumed the form of worship. The national vanity and the martial poetry of the Greeks were directly favourable to the posthumous fame of the heroes. Raised above the rank of mortals, the next step was to admit heroes to a participation with the nature of the gods. Elevated thus far, they were naturally considered as still exerting a powerful influence over the destiny of mortals. Hence splendid temples and costly monuments were built in honour of them, and propitiatory sacrifices offered to them. The canonization and worship of saints in later times affords an obvious analogy to the case of the classic heroes.

HEROD THE GREAT, the second son of Antipater of Idumæa, was made governor of Galilee at an early age, and effectually repressed the depredations of the bands of robbers by which the country was infested. Tried for executing Jewish citizens without legal trial, he confronted the Sanhedrim with an armed retinue, himself clothed in purple. He was made governor of Cœle-Syria by Sex. Cæsar, in which he was fully confirmed by Cassius. Felix and Antigonus attempted to drive him from power, but they were defeated, B.C. 41 ; Antony arrived in Syria, and Herod obtained his favour by costly presents. Favoured also by the venerable Hyrcanus, Herod, and Phasaël his brother, seemed established in power. Next year, however, Pacorus the Parthian, favouring the pretensions of Antigonus to the throne of Judæa, and encouraged by the discontent on account of the Roman exactions, led an army against Herod and Phasaël. Herod escaped, and being refused assistance from the king of Arabia, he hastened to Alexandria, whence he embarked for Rome. Here, through his influence with Antony, he was made king of Judæa, and set out under Roman auspices to wage war against Antigonus, his rival to the Jewish throne. After three years of vigorous warfare he regained possession of Jerusalem, B.C. 37. Summary executions were now the readiest means of getting possession of great wealth, and with this wealth he kept on good terms with Antony. So great was his power with the Romans that he made head against all the influence of Cleopatra, who cast a longing eye on Judæa, and who had used her influence with Antony to get that kingdom annexed to Egypt. Such was his address that, after the power of Antony was wrecked at Actium, Herod boldly went to Rhodes to meet Augustus, and expatiated upon the steadiness of his attachment to Antony. The scheme succeeded. Augustus established him on the throne of Judæa, and annexed several other places to his kingdom. He thus reached the summit of power in spite of busy enemies and deeply-seated unpopularity. His rival, Antigonus, as a representative of the Asmonæan line, had been the favourite of the people. When he regained possession of Jerusalem, he had executed almost every member of the Sanhedrim, besides others of distinction. Having put Antigonus to death, the high priesthood devolved upon Aristobulus, his wife Mariamne's brother, but he gave it to Ananel. Finding it politic, however, to reinstate Aristobulus, and then becoming jealous of his popularity, he had him secretly assassinated. Fearing he might fall by the snares of his enemies when he went to meet Augustus at Rhodes, he left orders that, in that case, Mariamne should be put to death. He had done the same on a former occasion, when he went to meet Antony, and in both cases the fact was divulged to Mariamne. At the instigation of his mother and sister, Mariamne was tried for adultery, and executed by his order. Notwithstanding the barbarous conduct which he thus exhibited, it was the strange fate of this monster to be passionately attached to Mariamne. The consequence was that after her death he became sullen, ferocious, and a greater terror to all near him than he had ever been before. Remorse acting on such a character brought on something like insanity, and a violent fever seemed as if the world were soon to be rid of him. *Herod's Lament for Mariamne* forms the subject of one of Byron's *Hebrew Melodies.* Upon his recovery, Alexandra, Mariamne's mother, and several others, were put to death.

Secure in the favour of Augustus and Agrippa, Herod did many things to render himself still more odious to the

Jews. He rebuilt Samaria and called it Sebaste, in honour of Augustus. He built a seaport, to which he gave the name of Cæsarea. He built a theatre in Jerusalem itself, and an amphitheatre beyond the walls, in which Roman shows of gladiators and wild animals took place. After an attempt made to assassinate him, he fortified Jerusalem, so as to render himself secure against popular outbreaks. Amongst the strongholds thus erected were Antonia and Hyrcania, the latter being used as a prison. Notwithstanding his generally oppressive government he made some attempts to ingratiate himself with the people. During a famine he distributed immense quantities of corn throughout the whole country, and more especially he undertook to rebuild with great splendour the temple at Jerusalem.

The closing years of Herod's life present a dark history of family discords, intrigues, jealousies, poisonings, and assassinations. He had two wives, of whom the most celebrated is Mariamne. Two of her sons, Alexander and Aristobulus, after having been educated at Rome, returned to Jerusalem, where they were in high favour both with their father Herod and the populace. However, Antipater, another son of Herod, by Doris, planned their ruin, and, after several unsuccessful accusations of conspiracy, the two sons of Mariamne were executed. Antipater himself engaged in a conspiracy, which being detected he was executed. Very shortly before the close of his life Herod ordered the massacre of the infants at Bethlehem. He was carried off by an excruciating internal malady in the 70th year of his age, after having been king of Judæa for nearly 40 years.

Herod, *Agrippa*. See Agrippa.

Herod, *Antipas*. See Antipas.

HERODIANS, a sect among the Jews, concerning whose origin and tenets very various opinions have been expressed. It is most probable that they were a political party who favoured the claims of Herod Antipas to the title of king. These *royalists* are in the New Testament generally opposed to the Pharisees or hierarchical party who struggled for the theocratic independence of the Jewish nation.

HERODIANUS, the last Greek historian of any note who wrote before the partition of the Roman empire. The date and place of his birth are unknown, but he flourished in the first half of the third century of the Christian era, and seems to have spent most of his life at Rome. His history, which is divided into eight books, embraces the interval between the death of Aurelius Antoninus, A.D. 180, to the accession of the younger Gordian, A.D. 238—comprising the reigns of Commodus, Pertinax, Julian, Niger and Albinus, Severus, Caracalla and Geta, Macrinus, Elagabalus, Alexander Severus, Maximin, the two Gordians, and Balbinus. This period, it will be seen, was one of the deepest historic interest from the frequent changes of emperors, the bloody wars, both foreign and domestic, the reckless struggles for power, the court intrigues, and the gradual decay of the old Roman empire before the inroads of the northern barbarians. Herodian's work, while it makes no pretensions either to critical views of history or to deep philosophy, yet bears an aspect of truthfulness and honesty, and embodies many details which would otherwise have infallibly perished. The best editions of Herodian are those of Irmisch, Leipzig, 1789; and Bekker, Berlin, 1826. Of the German translations the best are those of Gunradi, Frankfort, 1784; and Osiander, Stuttgardt, 1830.

HERODOTUS, the "Father of History," and the earliest of the Greek historians properly so called, was a native of Halicarnassus, a Doric colony of Caria, which at the time of his birth was ruled over by Artemisia, the heroine of Salamis. The date of his birth, once a subject of much dispute, is now fixed at B.C. 484, and few other incidents of his life are so well determined. A scanty notice of him by Suidas, and occasional allusions in his own works, are the materials from which his biographers have to construct his life. From these we learn that his family was one of noble rank in Halicarnassus, that his father's name was Cyxas, and his mother's Dryo, and that the famous epic poet Sanyasis was his uncle. On reaching manhood he found his native city enthralled by the tyrant Lygdamis, the grandson of Artemisia, and in disgust he retired to the island of Samos, where, besides learning the Ionian dialect, in which his history is written, he concerted measures for the emancipation of his birthplace. These measures were successful, but in the struggle which next ensued between the aristocratic and popular parties, Herodotus saw fit to leave his native town altogether. He is believed to have then joined a colony which the Athenians were sending out to Thurii on the Tarentine Gulf in Southern Italy, B.C. 445. Whether the historian joined the colony in that year or at a later period, as is sometimes affirmed, certain it is that he died at Thurii and was buried in the market-place of the town. The tradition of his having died at Pella in Macedonia is so ill-authenticated that it is needless to waste time refuting it. The exact date of his death is unknown, but he was alive in B.C. 408, being then in his seventy-eighth year, which it is probable that he did not long survive. Herodotus appears before posterity in the twofold character of traveller and historian; but the traveller is so subordinated to the historian as to be only called in at rare intervals to testify to the truth of some extraordinary statement. It is of course impossible from these slight hints to lay down a plan of his travels in strict chronological order. Yet modern scholarship has proved that he derived the greater part of the materials of his history from personal observation of the countries which he describes. With everything included under the general head of Hellas he was as familiar as with his native town; in many individual cities, such as Athens, Thebes, and Corinth, he is known to have spent a very considerable time. He also visited most of the Greek islands, as well those in the Ionian as in the Ægean Sea; all the colonies in Asia Minor; the whole circumference of the Black Sea, Scythia, and Thrace. In Asia he penetrated as far as Babylon, visiting also Ecbatana and Susa, besides making a special pilgrimage to Tyre to investigate the worship of Hercules. His account of Egypt, though a mere episode, is the best that antiquity has transmitted to us. Entering that country from the Mediterranean, he penetrated as far as Elephantine, its most southerly point. He then turned his face towards the west, and it is known that in this direction he reached Cyrene, though it is not improbable that he may even have visited Carthage. His taste for travel does not seem to have left him in his old age, for after finally settling at Thurii he travelled through the southern portion of the Italian peninsula, and some parts of Sicily. The fact that he visited all these countries is sufficient proof of his having visited many more; but his admiration for Greece and its laws and liberty remained unshaken to the last.

At what period of his life his travels were undertaken, is, like most of the other facts of his life, a matter of dispute. It is most likely that they were begun soon after his voluntary exile from his native city, and that they extended over the whole interval between that date and his fixing his residence at Thurii. Equally uncertain is the period of his life in which he reduced the results of these travels and observations into a comprehensive history. A story is told by Lucian, apparently in jest, that Herodotus read his "History," in its finished form to the assembled Greeks at Olympia, B.C. 456; that among his hearers was Thucydides, then a lad of fifteen, who was melted to tears by the recitation, and that the audience were so enchanted by the whole performance, that they called the nine books, into which the work was divided, by the names of the Nine Muses. Now, in that year the historian was only thirty-two years of age, and the work not only bears the marks of a matured and practised writer, but actual allusions to events which only took place many years after this date. Dahlmann, however, in his *Herodot, aus seinem Buche sein Leben*, proves beyond a doubt that the story is a mere figment of Lucian, and incapable of defence. Equally preposterous is the tradition that he read his work at Athens at the Panathenaic festival, B.C. 445, and that there existed among the archives of that city a decree awarding the historian ten talents as a token of national admiration for his genius. The preservation of this story is due to Plutarch, who records it in his essay on the *Malignity of Herodotus*. The general drift of this composition is to prove that Herodotus had been bribed by the Athenians. But the real ground of the Theban essayist's dislike to the panegyrists of Athens is that he recorded with the stern severity of truth the poltroonery of the Theban policy during the Persian War. Both these stories may therefore be safely dismissed as quite unworthy of attention.

The great work of Herodotus, which is divided into nine books, called by the names of the Nine Muses, is a history of the Greeks and their relations towards each other, and towards the foreign powers with which they came in contact, from the fall of Sardes before the victorious arms of Persia, B.C. 546, to the taking of Sestos, B.C. 478. To weld into one harmonious whole the different parts of so complex a subject, to order the march of events so that the story advances from a beginning to an end with the precision of a well-planned drama, to manœuvre the episodes and minute details so as to make them tell on the general result without impeding or interfering with it—such seems to have been the author's aim, and he has hit his mark so truly that Colonel Mure pronounces the *History of Herodotus* to be, next to the *Iliad* and *Odyssey*, the greatest effort of Greek literary genius. "The one," he says, "is the perfection of epic poetry, the other the perfection of epic prose. Were it not for the influence which the prior existence of so noble a model, even in a different branch of composition, has evidently exercised on the historian, his title to the palm of original invention might rival that of his poetical predecessor. In the complexity of the plan of his history, as compared with the simplicity of the execution; in the multiplicity and heterogeneous nature of its materials, and in the harmony of their combination; in the grandeur of its historical masses, and the minuteness, often triviality, of its illustrative details, it remains not only without equal, but without rival or parallel in the literature of Greece or of Europe." So great, indeed, is the entire work, that it has been left to posterity fully to appreciate it, and assign to its author his place among historians. It quite transcended the sphere of the small wits of Herodotus' day, who called his marvellous stories the tales of a traveller, little anticipating that after-ages as they rolled on would only confirm the truth and accuracy of the narrative in which they only found subject for laughter, and would acknowledge with one accord that without the history of Herodotus the annals of Greece would be an unintelligible blank.

The history of Herodotus having been written at a period when poetry had ceased to be the common vehicle of thought, and the art of writing prose had not yet been perfected, bears marks of this transition epoch. The logic of composition is not always observed, and many ill-compacted sentences might easily be pointed out. But there are few writers in any tongue in whom such slips are so easily pardoned or so thoroughly redeemed. Both in his style and his vein of sentiment there is a freshness which never fails, and which often rises to the poetical. Whatever the subject under treatment may be, it is sure to be invested with an interest which prevents the most fastidious of readers from feeling ennui. No chronicle of Froissart, or romance of Sir Walter Scott, was ever more interesting than the history of Herodotus. No traveller ever possessed in a higher degree than he the power of sifting what he observed, of preserving what was valuable, and rejecting what was silly or useless. This power he shows even in what many regarded as his weak point—his superstition. He always bows the head before what seems to him the saving element in the religious observances of the various peoples whom he describes. But though he is careful never to laugh at the monstrous absurdities with which these rites were sometimes accompanied, he always makes it plain that he saw through them. "The charm of Herodotus," says Dahlmann, "lies in that child-like simplicity of heart, which is ever the companion of an incorruptible love of truth, and that happy and winning style which cannot be attained by any art or pathetic excitement, and is found only where manners are true to nature; for while other pleasing discourses of men roll on like torrents, and noisily hurry through their short existence, the silver stream of his words flows on without concern, sure of its immortal source, everywhere pure and transparent, whether it be shallow or deep; and the fear of ridicule, which sways the whole world, affects not the sublime simplicity of his mind."

The literature of Herodotus is very extensive and important. The first edition of the Greek text was published by Aldus, Venice, 1502. A great advance on this was the edition of Henry Stephens, Paris, 1570. The next of any considerable value was that of Gronovius, Leyden, 1715; which was in its turn eclipsed by that of Wesseling and Walckenaer, Amst., 1763. Perhaps the best edition of this class, however, is that of Schweighaüser (Strasbourg, 1816), who has also published a very correct but rather meagre *Lexicon Herodoteum*. Next comes the edition of Gaisford, Oxford, 1824; a very careful work, but making comparatively little advance on its last German predecessor. The last edition is that of Bähr, Leipzig, 4 vols. 8vo, 1830. The best school editions are those of Matthiæ, Bekker, and George Long. On the geography of Herodotus valuable treatises have been written by Rennell, B. G. Niebuhr, Dahlmann, and Heyse. The best translations of Herodotus into modern tongues are those L'Archer, and Lange—the former into French, and the latter into German. There are several English translations, such as those of Beloe, Taylor, Cary, and others, but none which do any justice either to the spirit or the form of the original.

HERON, a mathematician and natural philosopher of Alexandria, was the pupil of Ctesibius, and flourished B.C. 284–221. His name has been preserved in the well-known experiment of Hero's Fountain, in which, by means of condensed air, water is made to spring from a jet in a continuous stream. The loss of some of Heron's works is matter of much regret. In those that survive mention is made of a steam-engine which seems to have been set in motion exactly on the principle of what is popularly known as *Barker's Mill*. It is only recently, however, that Heron's claims have found an advocate, and it is expected that further researches will bring to light results in the meantime quite unlooked for. (See Heron, by Augustus de Morgan, in Smith's *Dict. of Biog.*) Heron's most valuable work is that on *Pneumatics*, in which are given his experiments on the elasticity of the air and of steam. Besides his *Pneumatics* may be mentioned his *Barulcus*, an essay on the lifting of heavy weights; his essay on the *Construction of Automata*; his *Chiroballistra*, and his *Belipœica*, which treat of the artillery of the ancients; and a fragment on *Dioptrics*. Most of these works are to be found in the *Mathematici Veteres*, Paris, 1693.

Heron, called *the younger*, to distinguish him from his namesake of Alexandria, was, like him, a mathematician and natural philosopher. His birthplace, or even his country, is quite unknown, and even his *floruit* is only guessed to have been contemporaneous with that of the Emperor

Heraclius, A.D. 610–641. The writings assigned to this Heron are a treatise on *Geodæsia*, or practical geometry; another on the *Terms of Geometry;* and some works on various military matters, such as *The Attack and Defence of Towns;* the *Machines of War*. Some of these works appear in the *Mathematici Veteres;* others are printed separately; and some are still in MS.

HERON. See index to ORNITHOLOGY.

HERPETOLOGY, the natural history of reptiles. See REPTILIA.

HERRERA TORDESILLAS, ANTONIO DE, a Spanish historian, the son of Roderigo de Tordesillas and Agnes de Herrera (it being the custom of that country to bear the mother's name), was born in 1565. He was at first secretary to Vespasian de Gonzaga, viceroy of Naples, but was afterwards appointed historiographer of the Indies by Philip II., who granted him a liberal pension. Whilst he held this office he wrote his *General History of the Indies from* 1492 *to* 1554, in four volumes folio. Of all the Spanish authors, Herrera is the one who has given the most exact and circumstantial recital of the conquest of Mexico, and the other events in America. Hence, to use the words of Dr Robertson, his work "furnishes the fullest and most accurate information concerning the conquest of Mexico, as well as every other transaction of America. The industry and attention with which he consulted, not only the books, but the original and public records, were so great, and he usually judges of the evidence before him with so much impartiality and candour, that his decades may be ranked among the most judicious and useful historical collections." His death, which happened at Madrid on the 29th of March 1625, prevented him from occupying the office of secretary of state, to which Philip IV. had just raised him.

Besides the work above-mentioned, Herrera wrote in Spanish—1. Description of the West Indies, Madrid, 1601, in folio; 2. History of what passed in England and in Scotland during the forty-four years of the life of Mary Stuart, queen of Scotland, Lisbon, 1590, in 12mo; 3. Five books of the History of Portugal, and the conquest of the Açores in the years 1581 and 1583, Madrid, 1591, in 4to; 4. History of the affairs of France from the year 1585 until the end of the year 1594, Madrid, 1598, in 4to; 5. History of the World under the reign of Philip II. from the year 1584 until the year 1598, Valladolid, 1606, in three vols. folio; 6. Historical Treatise, Relation, and Discourse, of the Movements which took place in Aragon in the years 1591 and 1592, in 4to; 7. Commentary on the Proceedings of the Spaniards, the French, and the Venetians, in Italy, from the year 1285 until the year 1559, Madrid, 1624, in folio.

HERRERA, *Ferdinand de*, a Spanish poet of the sixteenth century, was born at Seville about the year 1516. He was thoroughly conversant with the Greek, Latin, Italian, and French languages, and also passed for a profound theologian; but he applied himself, in preference, to poetry, and was the first of the four Spanish poets who obtained the surname of divine. Although he had taken holy orders at the age of thirty, all his verses are addressed to a distinguished lady of Andalusia, whom he celebrates under various names; but his love was as pure and platonic as that of Petrarch, whom he endeavoured to imitate, in following the footsteps of Boscan and Garcilaso. Herrera died in his native place about the year 1595. The collection of his poetry—entitled *Obras de Herrera*, Seville, 1619—contains sonnets, songs, lyrics, and elegies, full of spirit, grace, and expression; but his style is at times deficient in correctness. Herrera was also the author of—1. *Relacion de la Guerra de Cypre y batalla de Lepanto*, Seville, 1572; 2. *Vida y Muerte de Thomas Moro*, ibid., 1592, translated from the Latin of Stapleton; 3. An edition of the *Poems of Garcilaso de la Vega*, with interesting notes, Seville, 1580, in 8vo.

HERRICK, ROBERT, a popular English poet, was born in London, August 20th, 1591. He was of an ancient and considerable family in Leicestershire. For centuries the Herricks had possessed the manors of Stretton and Houghton-on-the-Hill; and, settling in the town of Leicester at the beginning of the reign of Henry VIII., they gave a succession of mayors and parliamentary representatives to the borough. The literary honours of the race were not confined to the author of the *Hesperides;* from a branch of the same family was descended the mother of Dean Swift. Nicholas Herrick, the poet's father, being a younger son, removed to London, and commenced business in Cheapside as a goldsmith and banker. He died in 1592, leaving five children, of whom Robert was the fourth. Robert was indebted for a learned education to a rich uncle, Sir William Herrick, a man of abilities and address, who held offices of trust under Elizabeth and James, and was knighted in 1605. Sir William entered his nephew as a fellow-commoner of St John's College, Cambridge, in 1613. The latter afterwards removed to Trinity Hall, intending to study law; but he seems to have soon abandoned this intention, and, taking his degree of M.A., was presented by Charles I. to the vicarage of Dean Prior, near Totness, in Devonshire. Herrick was then thirty-eight years of age. He was probably known as a poet, and he had been a guest at the lyric feasts of Ben Jonson—

> "Made at the Sun,
> The Dog and Triple Tun,
> Where we such clusters had
> As made us nobly wild, not mad."

Such a brilliant town life was not fitted to recommend that of a poor vicar in a remote country parish, and Herrick appears to have been disgusted with "dull Devonshire," and with his parishioners, whom he describes as rude savages, "churlish as the seas." Even the rocky and picturesque scenery of the place comes in for a share of his vituperation. He admits, however, that he wrote his best poetry there, and much of it is devoted to praise of a country life. He paints in lively colours the charms of the rural May-day, village wakes, the harvest-home and Christmas revels, the herd whistling at the plough, the meadow enamelled with cowslips, and the autumn wain laden with its nodding sheaves. He solaced himself also by framing poetical posies for a string of imaginary beauties—his Julia, Anthea, Corinna, Electra, &c.; but Philips says he was "not particularly influenced by any nymph or goddess, except his maid Prue." Indeed, it is easy to see that in these curious and passionless love verses Herrick merely copied the fashionable style of poetic gallantry which had been common among the amatory and cavalier poets from the time of Lyly, Lodge, and others of the elegant Elizabethan versifiers. His praise of his housemaid Prue—

> "Jocund his muse was, but his life was chaste"—

was probably sincere. She had stayed with him, he says, till he had grown old, after all the summer birds had flown; and though "the grange" or parsonage at Dean Prior was humble enough (not even boasting a clock, to tell how night drew on), he and Prue were content with their humble Epicurean privacy, living on "their own," and having no fear of landlord or usurer to disturb their slumbers. The small establishment, however, was broken up by the storms of the Civil War. The Long Parliament ejected Herrick from his vicarage, and he flew, ravished in spirit, as he tells us, from loathed Devonshire to London, "the blest place of his nativity." Here, however, he found fresh cause for discontent and grief. He was reduced to depend solely on the generosity of his relatives and that of his brothers in misfortune, the cavaliers. He published his poems; his *Noble Numbers* in 1647, and his *Hesperides, or Works Humane and Divine*, in 1648. He mixed with the wits and poets of the time. Ben Jonson was gone, but he numbered among his friends Charles Cotton (a congenial spirit), the learned Selden, Sir John Denham, and Henry Lawes, who set some of his pieces to music, as he had previously done the lyrics in Milton's *Comus*. To all of these, and to most of the royalist nobles, Herrick addressed encomiastic verses. His works he dedicated to "the most illustrious and *most hopeful* Prince Charles," afterwards Charles II. His loyalty and sufferings merited reward when the Restoration came, but nothing better was done for Herrick than restoring him to his vicarage in Devonshire, which was probably welcome to him as a quiet retreat, for he was then bordering upon seventy. He lived fourteen more years; and the parish register of Dean Prior records that "Robert Herrick, vicker," was buried on the 15th of October 1674.

The works of Herrick have been often reprinted, both in an entire and a selected form. They consist of a multitude of small pieces classified under various heads—as pastoral and descriptive, amatory odes, aphorisms, anacreontic and bacchanalian, moral and pathetic, &c. His best inspiration, like that of Anacreon, sprung from wine, beauty, and flowers. He is often indelicate—gross in taste rather than licentious, and has many puerile and ridiculous conceits. He sometimes steals from his contemporaries. One short poem is servilely copied from a beautiful lyric in Ben Jonson's *Epicœne;* another is taken from Suckling; and there are imitations of Raleigh and others. He has no poem so fine as Cowley's *Chronicle* or *Grasshopper*, or Suckling's *Wedding;* and the exquisite snatches of verse, so full of classic grace and polish, scattered through Jonson's masques and plays, are of a higher mood than anything in Herrick. Perhaps in rural description he must also yield to another Devonshire poet of that period—Browne, author of *Britannia's Pastorals.* But Herrick's airy voluptuous style is decidedly original. His gaiety was of the heart, and was irrepressible. Some of his lyrics are so melodious as scarcely to require the aid of music to be sung; and his best pieces—as *Gather ye Rose-buds while ye may; Cherry Ripe; To Blossoms;* the *Parliament of Roses* (he has fairly exhausted the vocabulary of roses and kisses); *To Anthea, who may command him*, &c.—are of the real essence of poetry, unsurpassed for delicacy of sentiment and refined gallantry. (R. C—S.)

HERRING, in *Ichthyology*, a species of CLUPEA. See FISHERIES, and ICHTHYOLOGY.

HERRNHUT, a town of Saxony, circle of Bautzen, and 18 miles S.E. of the town of that name, on the Löbau and Zittau Railway. It was founded in 1722 by a colony of Moravians, who, having been driven by persecution from their homes, found an asylum here with Count Zinzendorf; and hence the Moravians are on the Continent generally styled *Herrnhüter.* It is still considered the chief seat of that body. Pop. about 1200.

HERSCHEL, SIR WILLIAM. See Sixth Preliminary DISSERTATION.

HERSFELD, a town of Hesse-Cassel, province of Fulda, on the left bank of the River Fulda, and 23 miles N. of the town of that name. It has several handsome churches, a reformed gymnasium, and a trade school. The chief manufactures are woollens and leather. Pop. 7000.

HERSTAT, a town of the Netherlands, in the province of Liège, on the left bank of the Meuse. It is a place in which there are very large iron works, and near to it is abundance of coals. It contains 4710 inhabitants, chiefly employed in making ironmongery.

HERTFORD, the capital of the county of Hertford, which is so called after it according to the Saxon custom. It is situated in a sheltered valley, on the River Lea, and, though of ancient origin, is now a neat, clean, and well built town. Hertford, pronounced Har'ford, is most probably a corruption of *Here*ford, or army ford, as it is situated near a ford of the River Lea, and it is also spelt Hereford by Saxon authorities, and in some monastic charters. Hertford is supposed to have been a principal residence of the East Saxon kings; and a castle, of which some relics still exist, was built here in 909 by Edward the Elder, to defend it from the Danes, who more than once ascended the River Lea and attacked it. In later times it was the scene of many historic events. The revolted barons, headed by the dauphin of France, captured Hertford Castle in the reign of King John. Edward III. made it the occasional prison of John II. King of France, and David King of Scotland. The court was several times held here, amongst others by Henry Duke of Lancaster, after the deposition of Richard II.; Henry VI., and Queen Elizabeth. Hertford is a corporate town by prescription; the earliest charter in existence is one granted by Elizabeth, but it recites that the place has been a borough from time immemorial. It is now governed by a mayor, four aldermen, and twelve councillors, and its boundaries have been enlarged by the Municipal Act to an extent of eight miles. Hertford returns two members to parliament, and is the assize town of the county. The shire hall is situated over the corn-market. The other public buildings are—the county jail and house of correction; two churches, All Saints and St Andrews; a town-hall; and an edifice built on the site of the ancient castle in the reign of James I. or Charles I., as a preparatory school to the East India Company's College at Haileybury. There is also a preparatory school for Christ's Hospital, located at Hertford in a spacious building. Boys are sent to it prior to being drafted into the school in London, while the girls admitted remain until their superannuation. The inmates usually number nearly 500, of whom four-fifths are boys. Hertford has also a free grammar school for thirty-six boys; a green-coat school for forty-five boys, the children of poor parents, who have never received alms; and the usual national and dissenting schools. It is a thriving town. A large quantity of malt is made here for the London breweries, and much wheat and wool is sent to the metropolis in exchange for coal, manure, and general commodities. The corn-market, held at Hertford on Saturdays, is one of the largest in the kingdom. The population was, in 1831, 5615; in 1841, 5911; and in 1851, 6605.

HERTFORDSHIRE, an inland county of England, bounded on the N. by Cambridgeshire, N. W. by Bedfordshire, E. by Essex, S. by Middlesex, and S.W. by Buckinghamshire. It is divided into eight hundreds, and 134 parishes, and has an area of 611 square miles, or 391,141 statute acres.

The level surface of the county is broken by gentle undulations, which in some parts form a quick succession of hills and valleys. The summit of Kensworth Hill, on the borders of Beds, the highest hill in the county, is 909 feet above the level of the sea. The county is rich in natural advantages. In early times, we are told by Camden, its ledges of hills yielded shelter, its woods fuel and building material, and its rich valleys, grassy bottoms, and teeming rivers furnished food, thus meeting half way the wants of its uncivilized inhabitants. "Its sweet, clear, and very beautiful air," says a later writer, "led many of our kings to build palaces in the county for their own residence, as well as for the training of their children." The London physicians sent patients there to prolong life when their skill was ineffectual, and the noble and wealthy built mansions, so that the county became subdivided into a large number of small estates, and the competition for land was so keen that it was a common saying, "He who buys a house in Hertfordshire pays two years' purchase for the air." The aspect of the county is pleasant and picturesque. Fine oak and other trees are grown in the hedges for fuel, and being interwoven by "plashing" their branches and stems, that is, by cutting them obliquely, so that they grow into each other, they form high walls of living timber, shading narrow winding lanes. The arable and pasture lands of the farms are intermingled with the parks and ornamental woods of the country seats, which, "mantled deep in leaf," are scattered thickly through the county. These features, varied occasionally by rivers, impart a peculiar beauty to the county, while in luxuriance it is not surpassed by any other county in England.

Geologically, the county forms part of the London chalk basin. The subsoil in almost every part is calcareous, and consists of two species, one of pure white chalk, the other of a softer kind, mixed with portions of whitish clay, and locally known as *marme*. The chalk substratum chiefly influences the nature of the soil in the northern district; clay prevails on the Essex and Middlesex borders, and in some parts it is highly tenacious and retentive of moisture. There are also some sandy loams mixed with gravel or clay. The vales traversed by rivers and streams exhibit in the bottoms a rich sandy loam; the sloping sides are covered by loams of inferior quality, and the flat surface of the high ground is generally formed of a loam of reddish hue tending towards common clay, with which it is often confounded. Arthur Young estimates that the county contains 46,720 acres of chalk, 90,240 of clay, 142,720 of loam, 5120 of rich loam, and 17,280 of rich gravel. From this it would appear that clay and loam are the prevailing soils.

The rivers of Hertfordshire are the Lea, which rises near Luton in Beds, enters the county at Hidemill, flows by Hertford, where it becomes navigable, and falls into the Thames a little below London, having received in its course the Rib, the Stort, the Quin, the Beane, the Maran, and the Kime; the Stort, which rises in Essex, and divides that county from Hertfordshire, until it falls into the Lea at Hoddesden; the Colne, which rises in Middlesex, passes through the western part of the county, and falls into the Thames at Brentford, receiving the Bulborne and the Ver or Meuse; the Gade, which rises on the borders of Bucks, and falls into the Colne near Rickmansworth; and the Ivel, a river composed of the inferior streams of the Oughton, Iliz, and Pirral, which passes into Beds, and reaches the German Ocean. The artificial stream, the New River, formed to supply the metropolis with fresh water, has its source in some springs near Ware, and running parallel to the Lea for many miles, obtains copious supplies from that stream. The Grand Junction Canal, extending from London to Birmingham, also traverses the county, passing by Watford and Berkhampstead. The Great Northern and Eastern Counties Railways furnish nearly all its towns with communication.

The main produce of Hertfordshire is corn; and the wheat grown at Wheathempsted, on the River Lea, is so fine that it has given a name to the district. The average produce for the whole county is—of wheat, 22 bushels per acre, oats 22 bushels, and barley 32 bushels, though on some highly cultivated farms the yield has been largely increased. Turnips were first introduced into this county in the time of Oliver Cromwell, who gave L.100 to the farmer for his enterprise; a large quantity is still grown. Artificial grasses have been sown to a large extent. There is indeed little natural pasture land. There are some very rich pastures on the banks of the River Stort, extending from Hertford to Hockeril, on the borders of the River Lea, and also near Rickmansworth, where they are watered by the River Colne. The whole of the meadow land might be greatly improved by irrigation, but the streams of water are so valuable for driving mills employed in grinding malt and flour for London, that little is applied to improve agriculture. In the S.W. part of the county large quantities of cherries and apples are grown; the former is the least valuable crop, as the fruit will not bear carriage so well as apples, and it is also inferior in quality to Kent produce, with which it has to compete in the London market. Each cherry-tree is usually allowed nine square perches of land; and the orchards, whether of cherries or apples, are generally four or five acres in extent. On the best soils nearest to London culinary vegetables are forced by the aid of rich manure, and more than one crop is sometimes obtained in the same year. The vicinity of London, in truth, stimulates production by creating a demand for it. The chalk found below the surface, abundantly laid on, greatly improves the heavy lands, while fertility is imparted by the rich manure brought from London in the barges which have conveyed the produce of the county thither. Soot, peat ashes, burnt bones, hair, and woollen rags are used for manure amongst more ordinary substances, while the sheep-fold and farm-yard dung is employed as universally as in other parts of the kingdom. The common system of cultivation is the five course—viz., turnips or fallow, barley, clover, wheat, oats. Naked fallows are very much adopted. Not only are the farms in this county small, but the ownership of the land is also much divided. There are fewer large proprietors than in other counties. The average extent of the farms is about 200 acres; and as this is a corn-growing county the quantity of stock kept upon them is small. Generally speaking there are about 100 ewes and six or eight cows on each farm. The calves are fattened, and the dairy produce sold as butter; the lambs are either fattened or sold as stores. The straw is sold, and soot purchased in its place. Six horses work the farm, and plough three in a line. Not much attention is paid to the breeds of animals, though amongst cows the Suffolk race is preferred, and amongst sheep the Southdown and Wiltshire kinds, and a cross between the Cotswolds and Leicester. The horses generally employed in agriculture are Suffolk punches, and large tracts of land are cultivated with clover and tares for their sustenance, as well as that of sheep and cows. An interesting laboratory of agricultural chemistry has been established near St Albans by a private individual, in which experiments on the nature and adaptation of manures are made on an extensive scale.

The principal trade of the county is in corn and malt, of which large supplies are sent to the metropolis, the transit being facilitated by the water communication which it possesses. Silk and cotton were at one time largely manufactured in the county, but of late years straw-plait has been the chief industrial pursuit. Lace-making and silk-throwing have all but ceased to exist.

Nothing certain is known respecting the tribes who inhabited the district before the Roman invasion. It is supposed, however, that it belonged to the Cassi or Catieuchlani, and that Cassivellaunus was their chief when the Romans destroyed Verulam, its principal city. It is thought that Hertfordshire was the scene of the struggle carried on by Caractacus; and it is certain that Verulam was captured, and its inhabitants massacred after the revolt of Queen Boadicea. When the Saxons subjugated the island, Hertfordshire was divided, and formed parts of the kingdoms of Essex and Mercia. In the year 896 the Danes ascended the River Lea as far as Hertford; but Alfred the Great, who then reigned, adroitly diverted the waters of the river, and compelled the freebooters to abandon their vessels, and seek safety by retreating across the island to the Severn. After the battle of Hastings, William the Conqueror attempted to pass through the county, but Fretheric, abbot of St Albans, who was of the Saxon royal blood, at the head of a confederacy of chiefs, stopped the Normans at Berkhampstead by throwing trees across the roads; and having threatened to raise Edward Atheling to the throne, William the Conqueror was induced to swear that he would govern according to the ancient laws of the realm—an oath which he did not scruple to break on becoming more powerful than those who imposed it. During the civil war of King John, the revolted barons, under the French dauphin, captured Hertford, the capital of the county. In the year 1455, during the wars of the Roses, Henry the Sixth was taken prisoner by the Yorkists, in a battle fought near St Albans; and in 1461 he was rescued in a second battle fought there, in which the Lancasterians were victorious. Hertfordshire was in later times the scene of an exploit which gave indications of the spirit and resolution of Oliver Cromwell. The High Sheriff of the county was proceeding to St Albans for the purpose of proclaiming, by order of King Charles the First, that all the parliamentary commanders were rebels and traitors, when Cromwell did not hesitate to arrest this high official, though at the time he was himself only a simple captain of his own troop of horse.

"There is scarce one county in England," says Camden, "can show more footsteps of antiquity." The Romans had several stations in Hertfordshire, amongst which were Verulamium or Verulam, and Durocobrivis; and traces still remain of the great Roman roads, the Watling Street, the Ichnield Way, and the Ermin Street, which traversed the county. St Albans Abbey is a noble pile, 600 feet long, and 200 broad, founded in 303, in honour of the first Christian martyr of Britain; it was much injured in Cromwell's days, and every style of Gothic architecture has been incorporated in the edifice. One side of the gateway is now a house of correction; the other is a petty jail. The famous cross at Waltham, erected to mark the spot where rested the body of Eleanor, Queen of Edward I., on its way to Westminster for interment, is now beautifully restored. The other antiquities of the county are the massive ruins of Berkhampstead Castle, and those of Bishop's Stortfort, Anstey, and Hertford; Roystone church and cave; the churches of Kingslangley, Baldock, and Hitchen; the remains of Gorhambury Abbey, Wymondsbury Priory, and some minor ruins.

The annual value of real property assessed in the property-tax 1850–1 was L.870,179. Pop. (1831) 142,844; (1841), 156,666; (1851), 167,298. In 1851 there were in the county 347 places of worship, with 95,585 sittings. Of these places of worship 162 belonged to the Church of England, 66 to Methodists of different kinds, 47 to Independents, 44 to Baptists, 7 to Quakers, and 4 to Roman Catholics. There were 236 Sunday schools, with 20,584 scholars; and 554 day-schools, with 23,373 scholars. Of the latter, 244, with 17,507 scholars, were public, and 310, with 5866 scholars, were private day-schools. The county returns three members to parliament, and Hertford two. St Albans returned two members to parliament till disfranchised in 1852, for corruption and bribery. (F. C.)

HERTHA, or HERTHUS, a great deity of the ancient Germans. Her name is doubtless the root of the modern English *earth*, and the German *Erde*, over which part of the world she was believed to preside. Tacitus in his *Germania*, states that she was worshipped with great solemnity by the Suevi, and that her temple stood in an island of the ocean, where her service was performed by a single priest. On great occasions, regulated by this priest, the covered chariot of the goddess was drawn forth from the sanctuary by the sacred cows and led in triumph throughout the country. Those districts was held to be peculiarly favoured through which the chariot passed; arms were laid aside; peace was proclaimed, and the time was spent in universal merry-making, till the priest declared that it was the will of the goddess to return to her shrine. Her image was then washed in a sacred spring; and as all who witnessed the ceremony of the ablution were drowned, the rites of the goddess Hertha were always associated in the minds of the vulgar with feelings of the most reverential awe. The island of Rügen was long regarded as being the sacred island of Hertha, but the honour has also been claimed for Heligoland and Zetland. Recent researches avail no further than to limit the choice to one of the Danish islands. The whole subject of Hertha and her worship is fully discussed by Grimm in his *German Mythology*.

HERULI, a nomad and warlike German tribe who made their appearance in various and widely separate parts of the Roman empire. They first occur in history on the northern shores of the Black Sea. Under the reign of Valentinian, they are associated with the Batavi as allies of the Romans against the Alemanni. They occur also in Britain. When Attila, king of the Huns, made his descent upon Western Europe, he was joined, amongst other tribes, by the Heruli, who subsequently, however, helped to destroy the power of the Huns. But the most memorable event in the history of this tribe was their overthrowing the Roman empire, A.D. 476. Their leader, at this time, was Odoacer, who is called King. Shortly subsequent to this, the Heruli established themselves into a more permanent body, near the banks of the Danube. Here they became a powerful nation, and the Ostrogoths sought their assistance against the Franks. Amongst the tribes which the Heruli had reduced to subjection, shortly after their establishment near the Danube, were the Longobardi, who succeeded in throwing off the Herulian yoke in the beginning of the sixth century. Of the dispersed Heruli, some proceeded to Scandinavia, and others got a settlement in Pannonia. These latter were troublesome neighbours to the western emperors. In Justinian's time they embraced Christianity. Under Todasius, a large party of them joined the Gepidæ in the wars against the Eastern empire, so that the Heruli fought against each other. As a warlike nation they were bold and hardy, and as being perpetually in motion, the helpless, whether from age or sickness, were put to death or left to perish.

HERVEY, JAMES, the author of the *Meditations among the Tombs*, was born in 1714 at Hardingstone, and educated at the grammar school of Northampton, whence in 1731, he passed to Lincoln College, Oxford. At that university he became deeply imbued with the views of the Methodists then struggling into influence and notice; and though he never openly identified himself with their sect, yet the whole tenor of his life was in strict accordance with their views. Entering the English church in 1740 as curate of Biddeford, in Devonshire, he was three years later appointed to succeed his father in the living of Weston Favell in Northampton, to which he afterwards added those of Weston and Collingtree. In this sphere he wrought with the disinterested zeal and fervour of an apostle, sacrificing his health, and finally his life, in the duties of the good cause. He died of consumption brought on by overwork, December 25, 1758. His works, which are numerous, and all on religious subjects, long enjoyed a popularity quite out of proportion to their deserts. His literary merits are very small; and even his *Meditations among the Tombs*, his best work, is so viciously rhetorical, tasteless and diffuse, that it is matter of wonder how it still finds admirers or even readers. Of his other works may be mentioned his *Contemplations on the Night and Starry Heavens; Theron and Aspasio, a Series of Dialogues on the most important Subjects;* and his *Letters*, published in 1811, which illustrate his amiable character and the whole history of his life.

HERVEY, *John*, Lord, the *Sporus* and *Lord Fanny* of Pope's satire, a nobleman of political and social distinction in the reign of George II. He was son of the first Earl of Bristol, and born in 1696. Educated and trained for public life, he became a favourite at the court of the prince and princess (afterwards George II. and Queen Caroline), to which Pope, Gay, Arbuthnot, Chesterfield, and other wits resorted, and which was celebrated for the beauty and accomplishments of its ladies—as Miss Bellenden (afterwards Duchess of Argyle), Miss Howe, Miss Lepell, and Mrs Howard, names which will live for ever in the poetry of Pope, Gay, and Swift, and in the lively memoirs and correspondence of that brilliant circle. Hervey was married to Miss Lepell in 1720. In 1730, he received the appointment of vice-chamberlain to the king; in 1733, Sir Robert Walpole called him up to the House of Lords, where he proved a frequent and effective speaker; and in 1740, he succeeded Lord Godolphin as privy seal, which he held until the Walpole administration was driven from power in 1742. Destitute of any commanding talents or solid principle, a sceptic in religion, and profligate in morals, Lord Hervey was yet far above the intellectual rank assigned him by his merciless satirist, Pope. He wrote and spoke vigorously on public questions, he was studious and laborious, a fair scholar, and a writer of pleasing occasional verses. In his famous quarrel with Pope, the poet seems to have been the aggressor. His pride and jealousy were easily ruffled, and Lord Hervey and Lady Mary Wortley Montagu had, he said, "too much wit for him." Both parties disgraced themselves in their poetical attacks—the lord and lady for having grossly alluded to Pope's obscure birth and personal appearance; and Pope for having indulged in coarse and unmanly slander on Lady Mary, and on the forced abstinence and ill health of Lord Hervey. "It would be now idle," as Mr Croker remarks, "to seek for a cause of quarrel which the parties were, a hundred years ago, unable or unwilling to explain; but may it not be sufficiently accounted for by the jealousies almost inevitable between persons of such similar, and therefore discordant tastes and tempers, living together in a circle of tittle-tattle, scandal, and pasquinades?" Political differences also arose; Lord Hervey and Lady Mary adhered to Walpole, while Pope and his brother wits were chiefly associated with the opposition. Lord Hervey died in 1743. He left behind him *Memoirs of the Court of George II.*, which were not published until 1848, when they appeared in two volumes, edited by Mr Croker. The work throws much light on the interior of the court—its coarseness, dulness, and immorality; but it is as degrading to the author as it is to the English monarchy, for Lord Hervey appears rather in the light of a court parasite and malignant gossip, than in that of an English gentleman or fair historian. (R. C—S.)

HESIODOS, in *English*, Hesiod, one of the earliest poets of Greece, was a native of Ascra in Bœotia. His era is nearly as uncertain as that of Homer, whose name is very frequently associated with his in the classics. Herodotus fixes it at about 400 years before his own time, thus making it about the middle of the 9th century B.C. Velleius Paterculus places him about 120 years after Homer, and that opinion has been very generally adopted by modern scholars; his *floruit* may be thus approximately placed about the middle of the 8th century B.C. Of the personal history of the poet very little is known. His father was a native of Cumæ in Æolis, who emigrated with his son Perses to Ascra, where the future poet was born. He seems to have been a man of humble rank and small means, for his younger son was, at an early age, sent to tend flocks on Mount Helicon. On his father's death he became involved in a law-suit with his brother Perses about the division of the little patrimony. The suit went in favour of Perses, and Hesiod, in disgust at what seemed to him the injustice of the Ascrean judges, retired to Orchomenus, branding his native town as "miserable in the cold, intolerable in the heat, bad always." He spent the remainder of his life in that city, and his tomb was long after pointed out there. Plutarch records a tradition that he met his death at the hands of some youths who had suspected him (quite unjustly, as afterwards appeared) of having dishonoured their sister. This, however, is perhaps only one of the many tales told about the manner of Hesiod's life and death by Tzetzes, Proclus, and others, to which no credence can safely be attached. The works that pass as Hesiod's, though their genuineness is gravely doubted, are three in number,—*The Works and Days*; the *Theogony*; and *The Shield of Hercules*. In the time of Pausanias, the first only of these was believed by the people of Ascra and its neighbourhood to have been really the work of their countryman. The introduction, and many interspersed passages, they regarded as later interpolations. Many parts of the poem, however, are undoubtedly Hesiod's, and there is equally little doubt, that as these now stand, they have been tagged together by a connecting narrative of a later date. The poem itself, which is in a didactic vein, professes to be a series of advices on political, ethical, agricultural, and domestic matters from the poet to his elder brother Perses. It is written in a very unpretending homely style, and accorded so ill with the warlike taste of the time, that Cleomenes the Spartan called its author the poet of Helots. Despite all its want of unity and plan, however, the poem, in its genuine parts at least, is valuable to us from the light it throws on the domestic manners of the early Greeks. The *Theogony* is now admitted, on all hands, to have been the work of a bard posterior to Hesiod, though a member of the Hesiodic school. It professes to describe the creation of the world, the birth of the gods, and the origin of the heroes. Whence Hesiod obtained the materials for his *Theogony* can only be conjectured. Herodotus affirms that he merely collected and systematized the local legends that had existed in various parts of Greece long before his day. But he also awards him the honour of having formed the mythology of Greece as it was now finally accepted, by having impersonated in his gods qualities and attributes that had formerly existed merely in the abstract. This, whether true or not, had given birth to the theory that the sources from which the author of the *Theogony* drew his materials, were philosophical, and not purely mythological speculations, and that in them may be detected the germs that afterwards flowered into the Greek philosophy. The *Shield of Hercules* is an inferior imitation of Homer's magnificent description of the Shield of Achilles. It is believed to have formed part of another poem ascribed to Hesiod, entitled *Eoeæ*, or *Catalogi Mulierum*, giving an account of the most famous of the mythical heroines. Parts of this work are attributed to writers long posterior to Hesiod.

The works of Hesiod were first printed at Milan in 1493, and two years later by Aldus at Venice. Of subsequent editions, the best are those of Daniel Heinsius, Amst., 1667; Robinson, Oxford, 1737; Gaisford, Oxford; and best of all, Dindorf, Leipzig, 1825, and C. Göttling, Gotha and Erfurdt, 1831.

HESPERIDES, in *Grecian Mythology*, the nymphs whose duty it was to watch over the golden apples presented by Tellus to Juno on the occasion of her marriage with Jupiter. Their number and names, like those of the Atlantides, with whom they are often identified, are very variously given; but the received accounts represent them as three in number, and bearing the names of Arethusa, Ægle, and Hesperia or Hesperethusa. Their home, according to the earliest legends, was an island in the western ocean, so near the setting sun that foot of man could never reach them. In their watch over the golden fruit, they were assisted by the sleepless dragon, Ladon. One of the twelve labours of Hercules was to slay this dragon and carry off the fruit. In the attempts to localize the home of the Hesperides, the ancient poets assigned it to different spots of Africa, such as the Cyrenaica, the neighbourhood of Mount Atlas, an oasis in the great desert, or to the Happy Islands in the Atlantic.

HESSE, Hessen, or Hessia, a country of Germany, formerly constituting a province of the empire, under the charge of a landgrave. It formed part of the circle of the Upper Rhine, and was situated on the rivers Rhine and Mayn, to the N. and S. of Frankfort, being about 150 miles in length, with a varying breadth. The northern portion, or Hesse-Proper, was anciently included in the landgraviate of Thuringia; but in the year 1247, it passed by inheritance to Henry the Child, a prince of Brabant, in right of

Hesse-Cassel.

his mother. From him it descended to Philip the Magnanimous, so well known in the history of the Reformation; and by his sons it was divided into several principalities, the princes of each of which retained the ancestral title of landgrave. After undergoing various changes through family successions and political revolutions, the ancient and acquired territories of the Hessian princes are now divided into three sovereign states, members of the Germanic confederation, and named respectively,—1. Kur-Hessen, called also Hesse-Cassel or Electoral-Hesse; 2. Grand-ducal Hessen, or Hesse-Darmstadt; and 3. Hesse-Homburg.

Kur-Hessen, or *Hesse-Cassel*, consists of one large mass, two smaller masses, and several still smaller separate portions of land, all situated to the N.E. of Frankfort-on-the-Maine, to the distance of 110 miles, and containing altogether a superficial area of 3724 English square miles. It is divided, or rather united, for administrative purposes, into four provinces, the names, areas, and populations of which are:—

Names.	Area.	Pop. (1854).
Lower Hesse with Schaumburg	1703	367,575
Upper Hesse	766	124,762
Fulda	720	138,685
Hanau	535	124,328
	3724	755,350

Kur-Hessen is mostly situated on the table-land of Central Germany, at a mean elevation of 500 to 600 feet above the level of the sea; but the southern portion sinks down into the valley of the Maine, beside Hanau and Frankfort. The upper country is hilly and even in its southern portion mountainous; but among the hills there are extensive and even moderately fruitful valleys, drained by abundant streams, which contribute to form the Werra and the Fulda, the two main branches of the Weser; and the Lahn, a tributary of the Rhine. And, as the Fulda becomes navigable at Hersfeldt, 30 miles above Cassel, and the Maine is navigable above Hanau, the country enjoys by their means, an easy access to the ocean for the export of its produce. The climate is generally a degree colder than that of the parts of Baden, at the same elevation.

The chief employment of the people is in agriculture; and rye is the staple production of their industry. Wheat, however, is cultivated in some favourable places, and oats and barley everywhere. Potatoes are likewise cultivated to a large extent, and form a principal part of the food of the Hessians, yielding also a large quantity of brandy. Tobacco is grown on the banks of the Werra, in the district of Schmalkald, and also in the district of Hanau, which is reckoned the best in Germany. The vine reaches the northmost point of cultivation at Witzenhausen, in the valley of the Werra; but the total quantity of ground occupied by vineyards is only about 300 acres, and the produce insignificant. Hemp is raised in Hanau, and flax in the other provinces, and these two, with wood from the forests, are the chief articles of export. There are some mines of copper, cobalt, and iron, to supply the demand for necessary utensils. Manufactures are very inconsiderable, except for domestic purposes, and yield nothing for export.

Till the present century the sovereign of Hesse-Cassel bore the simple title of landgrave; but, in 1802, he was raised to the dignity of an elector of the Holy Roman empire, and, though the empire was dissolved, and the functions of the electors consequently ceased in 1806, his successors were allowed by the Congress of Vienna to retain the title of *Kurfürst*, or Prince-Elector, as higher than that of Grand-Duke, then conceded to the landgrave of Hesse-Darmstadt and several other princes. He takes the prefix of Royal Highness; bears also the title of Grand-Duke of Fulda; and ranks in the 8th place in the confederation, next after the Grand-Duke of Baden. Since that time his territory has been distinguished by the title of *Kur-Hessen*, or Electoral-Hesse. Till 1848 the constitution of the state was that of a monarchy feebly limited by provincial states. In that year the constitution was made more popular; but the subsequent re-action proved most injurious. During the year 1851, Kur-Hessen was occupied by the troops of the confederation, and subjected to military law. In 1852 a new constitution was promulgated, on the illiberal principles dictated by the diet, and the elector is again virtually an absolute prince, whose rule has been very little satisfactory to his subjects. The Hessians were long considered to be behind their neighbours in intellectual cultivation; but that reproach has been, or is in the way of being, wiped off by the establishment of the usual sorts of schools and colleges. There is a university at Marburg containing 30 professors, attended by only about 360 students.

Hesse-Darmstadt.

The state revenue amounts to about L.600,000 a-year, and the expenditure to at least as much; and, like the other states, Kur-Hessen is burdened with a considerable debt, the exact amount of which seems not to be known, as the latest published account of it we have been able to meet with, is no later than 1840, when it amounted to 1,642,566 thalers (L.246,385 sterling).

The Kur-Hessians belong mostly to the Reformed confession of the Evangelical church; there are, however, many Lutherans, a few Romanists, and Jews. In every thousand inhabitants there are reckoned 600 Reformed, 231 Lutherans, 154 Catholics, and 15 Jews; of the latter the total number is estimated at about 10,000.

The Kur-Hessian contingent to the federal army amounts to 5679 men. Kassel or Cassel, a fine town on the Fulda, about 90 miles N.E. of Frankfort, is the seat of government.

Hesse-Darmstadt, or *Grand-ducal Hesse*, consists principally of two large portions of territory, one to the N. and the other to the S. of the River Maine, the latter including the country on both sides of the Rhine, from Worms to Mainz. Three smaller separate portions lie within the territory of Baden; other three separate parcels in Waldeck, and some still smaller in Nassau and Kur-Hessen. The aggregate area is 3232 English square miles; and the separate parcels are united, for administrative purposes, into three provinces, as stated in the following table:—

Province.	Area in Square Miles.	Population in 1852.	Capital.
Starkenburg	1169	319,050	Darmstadt.
Rhenish Hesse	529	225,647	Mayence or Mainz.
Upper Hesse	1543	309,617	Geissen.
	3232	854,314	

In general this territory is rather mountainous; but in the southern division, along both sides of the Rhine, there are extensive plains, rich and fertile; and in the northern province, near the Maine, there are some moderately large valleys. It is generally a well-watered country, its streams pouring themselves into the Rhine and the Weser. Few countries of the same extent have a greater variety of climate. In the neighbourhood of the Rhine and the Maine it is mild and agreeable, the winter is short, the summer warm, and the air generally dry. The hay harvest begins early in June, the corn harvest in the middle of July, and the vintage in the latter part of September. In the Odenwald, on the contrary, the climate is raw and cold, the spring is later, and several weeks more are required to ripen the fruits of the earth. As in Kur-Hessen, here also agriculture employs the bulk of the people. Rye is the chief crop, though some good wheat is grown. Fruit is very abundant, such as apples, pears, plums, almonds, and chestnuts. Wine is, next to corn, the most important product, and its annual value is estimated at about half as much as that of the grain. The breeds of domestic animals are of the usual kinds, and present nothing remarkable. Wood from the forests is an important article of export by the Maine and the Rhine, for the great mart for that commodity in Holland.

The mineral wealth consists of the produce of some iron and copper mines; but the quantity produced is insufficient for the consumption. The manufactures consist chiefly in working up the raw materials of wool, flax, and iron into articles of internal consumption; and there are, besides, some manufactures of paper, glass, copper, and iron wares. The chief articles of export consist of barley, wine, tobacco, rape-oil, dried fruits, madder, clover-seed, wood, honey, wax, and feathers. These are exchanged for colonial wares in Holland, and articles of dress and furniture brought from France and Belgium.

In respect of religion the great bulk of the people are Lutherans; and the relative proportions of the different sects are estimated thus:—Lutherans, 397; Reformed, 84; Mennonites and Inspired, $1\frac{1}{3}$; Catholics, 167; Jews, 20. These proportions, however, vary in the different provinces. In Rhenish Hesse the Catholics form the larger half of the population, or 93 to 87; in Upper Hesse, on the contrary, the Protestants number 251 to $12\frac{1}{2}$ Catholics; and in Starkenburg, 178 to $71\frac{1}{2}$. Education is well attended to in the usual sorts of schools, and there is a university at Giessen, with 32 ordinary professors, and about 380 students.

The reigning sovereign is a landgrave of Hesse; but he now bears the higher style and title of His Royal Highness the Grand-Duke. He is feebly limited by the States, the re-action that followed the revolution of 1848 having had as full effect in Darmstadt as in Cassel. The public revenue is estimated at the yearly sum of 8,206,873 florins (L.820,687 sterling); and the expenditure is fully as much. The public debt, at the end of 1850, amounted to 3,674,622 florins (L.367,462); and the debt incurred in the construction of railways to 11,848,607 florins (L.1,184,860). The army amounted in 1855 to 10,514 men, and the contingent to the federal army is 6195.

The capital of the state and seat of government is Darmstadt, in the province of Starkenburg, about 20 miles S. of Frankfort, with about 25,000 inhabitants; but the principal town is Mainz or Mayence, in Rhenish Hesse, on the S. bank of the Rhine, one of the strongest fortresses in Europe, and the bulwark of Germany against France. It is garrisoned by the troops of the Confederation; but the civil administration belongs to the Grand-Duke. The population, including the permanent garrison of 6000 men, exceeds 40,000.

HESSE-HOMBURG is a very small territory of about 106 square miles, belonging to a prince of the family of Darmstadt, with the title of landgrave. It consists of two principal parts, one on the slopes of the Taunus, N.W. of Frankfort, and the other to the westward of the Rhine, S.E. of Bingen. These form two provinces, of which Homburg, on the N., contained in 1852, 11,166 inhabitants, and Meisenheim in the W., 13,755. Both provinces enjoy a fruitful soil, and a healthful climate, are well cultivated, and yield a surplus of corn, wool, flax, and wood. Meisenheim likewise produces wine and coal, by means of the latter of which the people are enabled to produce some manufactures of glass and ironmongery wares. The majority of the people belong to the Lutheran confession; about 6000 to the Reformed, 3000 Catholics, and 1000 Jews. The public revenue is about L.35,000; and the debt amounted in 1854 to L.115,270 or thereby. The contingent to the federal army is 333 men. Homburg, a small town, with about 3600 inhabitants, 10 miles N. by W. of Frankfort, is the capital. The landgrave is now 73 years of age (April 1856), unmarried, and without heirs male; so that at his decease, his territory will be annexed to that of Hesse-Darmstadt.

HESYCHIUS, author of the *Greek Lexicon* which bears his name. Nothing whatever is known of his history. Some suppose him to have been a Pagan, who lived before the close of the fourth century A. D.; while, from certain glosses in the *Lexicon*, others suppose him to have been a Christian. It is allowed, however, that these glosses are interpolations. The plan of the *Lexicon* is explained in an introductory letter to Eulogus, who also is unknown. In this letter Hesychius proposes to make the Lexicon of Diogenianus the groundwork of his own. It is valuable for the quotations from works which have perished, and more especially as being one of the oldest works of the kind in existence. The best edition of the *Lexicon* is that of Alberti, 1746, completed by Ruhnken, 20 years later.

HETMAN, a Cossack title. See COSSACKS.

HETTOWRA, a town of Hindustan, in the Nepal territories, and the centre of all commerce carried on between the Nepal dominions and those of Oude and the Company. It is situated on the Rapti river, and is a miserable village, consisting only of about sixty houses. E. Long. 85. 3., N. Lat. 27. 26.

HEVELIUS, or HEVELKE, JOHN. See the historical part of art. ASTRONOMY.

HEXAMETER, the commonest and most important form of dactylic verse, so called from its consisting of six feet or measures. In the first four places of the line these feet may be dactyls or spondees indifferently, but the fifth is almost invariably a dactyl, and the sixth always a spondee. In a few rare cases, either to vary the rhythm or to produce some special effect, a spondee is introduced in the fifth place, and the line is then called a spondaic line. The correctness and beauty of hexameter verse depend in great measure on the proper distribution of the cæsural pauses. See CÆSURA.

So far as extant data enable us to judge, we may conclude that the classical tongues of Greece and Rome are alone adapted to the successful cultivation of the hexameter metre. It is certain, at least, that all attempts to naturalize it in modern poetry have only proved failures of different degrees of badness. The first who endeavoured to accommodate it to the structure of the English language was Gabriel Harvey, the friend of Spencer, and the "Hoby nol" whose poem is prefixed to the *Faëry Queen*. So ill was the attempt received, however, that no one stepped forward to take part in his defence, when he found himself assailed with the bitterest sarcasms by the leading wits of the days. Tom Nash in particular, the Lucian of his age, assailed the luckless innovator with a keen-edged malignity that was further whetted by a feud of long standing between him and Harvey. A poem of the latter, entitled *Encomium Lauri*, begins with these absurd lines:—

> "What might I call this tree? A Lawrell? O bonny Lawrell!
> Needes to thy bowes will I bow this knee and vayle my bonnetto!"

Nash happily burlesques these lines by describing Harvey sitting under a yew tree in the grounds of Trinity College, Cambridge, inditing a sonnet to the weather-cock on the spire of Allhallows,—

> "O thou wether cocke that stands on the top of Allhallows,
> Come thy waies down if thou darst, for thy crowne, and take the wall on us."

"The hexameter," he continues, "I graunt to be a gentleman of an auncient house (so is many an English beggar), yet this clyme of ours hee cannot thrive in; our speech is too craggy for him to set his plough in; hee goes twitching and hopping in our language, like a man running upon quagmires, up the hill in one syllable and down the dale in another, retaining no part of that stately smooth gate, which he vaunts himself with among the Greeks and Latins."

The objections brought forward by Tom Nash, three centuries ago, still hold good; and the partial successes of Southey, Lockhart, and more recently of Longfellow, only go to confirm the verdict then pronounced. In German the

Hexapla || Heylin.

result of the experiment, apparently different, is in reality the same. The hexameters of Schiller and Goethe contain too many beauties of thought and poetry to be readily forgotten, yet in so far as they are merely hexameters, they only serve as a beacon to warn less skilful pilots off a coast where shipwreck is certain. English and German being thus doubtful vehicles for the hexameter verse, French and Italian may be given up as wholly impracticable, nor are we aware of a single successful effort in this metre in either of those tongues.

HEXAPLA, a collection of the Holy Scriptures in six languages. The term is generally applied to the edition of Origen, which contains the text in Hebrew and Greek letters, along with the Septuagint versions and three other translations. See Bible, and Origen.

HEXASTYLE, in *Architecture*, a building or a portico with six columns in front.

HEXHAM, a market-town of England, county of Northumberland, on the south bank of the River Tyne, 20 miles W. from Newcastle. A handsome stone bridge of nine arches crosses the river at this point, and the Newcastle and Carlisle railway passes the town. It has some tolerably wide streets, but the greater number are narrow and irregular. The market-place is a spacious square, having a neat market-house, supported by pillars, with an open space underneath, and stalls for country dealers. The priory church is a cruciform structure, in a mixed Gothic and early English style, surmounted by a tower about 100 feet high. The nave, which was burnt by the Scots in 1296, still exists in ruins. Hats and gloves constitute the principal manufactures of the town. It has a free grammar school, mechanic's institute, savings bank, dispensary, and almshouse. Market-day, Tuesday. Roman remains have been found at Hexham, which is supposed to have been a Roman station, probably Axelodunum. In the seventh century a monastery was founded here by St Wilfrid, and soon afterwards a bishop's see was established. The diocese was afterwards united to Lindisfarne. Hexham is noted for the great defeat of the Lancastrians in 1464. Pop. (1851) 4601.

HEYLIN, Peter, D.D., an English miscellaneous writer, was born in 1600, at Burford, near Oxford. He was educated at that university, and, after graduating, lectured publicly on history and geography. Entering the church, he was appointed chaplain to Charles I., who rewarded his bigoted royalism with several valuable livings. His monarchical enthusiasm was by no means quenched when, like all the king's favourites, he found himself marked out for punishment by the parliamentarians, who stripped him of all his preferments and property. He had before this made himself a considerable name as a writer by the publication, in 1625, of his *Microcosmus, or a Description of the Great World*, which had enjoyed a wide circulation, and been several times reprinted. He now devoted himself to literature, and produced in all no fewer than 37 different works on history, geography, and divinity, besides poems and miscellaneous works. These, though now known only to the antiquarians, were extremely popular in the seventeenth century, especially among the royalists, whose cause he vindicated with much ability and zeal. His historical works in especial, were conceived and written in a spirit of the most bigoted partizanship. After the Restoration, Heylin was for a time utterly neglected by the party in whose service he had lost his all; and it was only a very few months before his death, in 1662, that his services were shabbily requited with the sub-deanery of Westminster. Among his principal works are a *Life of Laud*, a *History of the Tithes*, *Defence of the Church of England*, and a very graphic and humorous narrative of a six weeks' tour on the Continent, which repays perusal now better than almost any of his more elaborate writings.

Heyne.

Not long after Heylin's death, two biographies of him appeared, the first by "one Mr George Vernon of Gloucester," and the other by Dr Barnard, the son-in-law of the deceased controversialist, and an accomplished scholar. Vernon was a kind of literary pet of the Heylin family, who seem to have instigated him to a piece of literary workmanship, for which he was quite unfit. The furious quarrel that ensued between him and his learned rival, and which resulted in the complete victory of the latter, has found a place in Disraeli's *Curiosities of Literature*.

HEYNE, Christian Gottlob, an illustrious classical scholar and archæologist, was born on the 25th of September 1729, in a suburb of the city of Chemnitz, in Saxony, where his father, having been compelled by some religious persecutions to abandon his native country of Silesia, had settled, supporting his family in great poverty by exercising the trade of a weaver. It was only by the liberality of his godfathers that Heyne was enabled to obtain his primary instruction in the elementary school of Chemnitz, and afterwards to prosecute his classical studies in the gymnasium of that city. In 1745 he entered the University of Leipzig. There he was so scantily supported by those on whose assistance he relied, that he was frequently in want even of the common necessaries of life, and was sometimes indebted for food to the generosity of a maid-servant in the house where he lodged. In this situation, without even the hope of future distinction, he continued to struggle on against every difficulty and disappointment, in the acquisition of knowledge. For six months he is said to have allowed only two nights in the week to sleep, and was at the same time forced to endure the reproaches which his godfather thought himself entitled to inflict on him for negligence in the prosecution of his studies. His distress had almost amounted to despair, when he procured the situation of preceptor in the family of a French merchant resident in Leipzig. He was thus enabled to continue his studies, though with much interruption; the emoluments of his appointment being sufficient to support him in what was at least comparative comfort. Under Ernesti, he was initiated into the criticism of the classical authors; from the prelections of the celebrated Bach he acquired a competent knowledge of the Roman jurisprudence; and through the instructions of Christius, who lectured on archæology, and with whom he was intimately acquainted, his attention was strongly directed to the works of ancient art. Having finished his studies at the university, he was exposed for many years to all the accumulated distresses of poverty and neglect. The first situation he was able to procure was that of copyist in the library of Count von Brühl, with a salary of only an hundred dollars, which he obtained in the year 1753. From the necessity of adding something to this scanty pittance, he was forced to employ himself in the drudgery of translation; and, besides some French novels, he translated into German the Greek romance of Chariton. He published his first edition of *Tibullus* in 1755, and in 1756 his *Epictetus*. In 1756, his emoluments as copyist were doubled, and the education of Prince Maurice von Brühl was intrusted to him, but without any additional salary. The invasion of Saxony by the Prussians deprived him of his appointment, and even destroyed the library on which it depended. The period of the Seven Years' War was that in which he was chiefly exposed to the storms of fortune; and his marriage with Theresa Weisse, a young woman of distinguished genius, but equally poor with himself, increased his misery. Having been obliged to retire into Lausatia, he lived for some years as steward in the family of the Baron von Leoben. He was enabled, however, to return to Dresden in 1762, where he was intrusted, by Lippert, with the care of writing the Latin text of the third volume of his *Dactyliotheca*.

At length, in the commencement of the year 1763, his merit met with its reward, and a new and illustrious career was opened to him. On the death of John Matthew Gesner, in 1761, it became necessary for the curators of the university of Göttingen to look around for a successor capable of sustaining the reputation which the institution had acquired by the learning and talents of that distinguished scholar. The appointment was offered to Ernesti, who, whilst he declined leaving the university of Leipzig, proposed Ruhnkenius of Leyden or Saxius of Utrecht for the situation. Ruhnken likewise refused the appointment, but having been strongly impressed by the taste and learning displayed by the editor of Tibullus and Epictetus, he advised Muenchhausen, the Hanoverian minister and principal curator of the university of Göttingen, to bestow the professorship on Heyne, whose merit, though known to few, he ventured to promise would do honour to the choice. The minister had the good sense to acquiesce in the recommendation of this great scholar, and Heyne, after some delay, became professor of eloquence in Göttingen. Though his appointments were at first few, and his emoluments inconsiderable, these were gradually augmented in proportion as his usefulness was approved, and as his growing celebrity rendered it an object with the other governments of Germany to secure for their literary institutions the services of so distinguished a scholar. He refused the most advantageous and honourable overtures from Cassel, Berlin, and Dresden. In his different capacities of professor, principal librarian, member of the Royal Society, and chief editor of the *Literary Gazette*, and still more by his publications, he mainly contributed to raise the university of Göttingen to the distinguished rank it holds among the seminaries of Europe. After a long and useful career, graced with all the distinctions which in Germany are conferred on literary eminence, he died, full of years and honour, on the 14th of July 1814.

In Greek literature he has given us editions of Homer's *Iliad*, Pindar, Diodorus Siculus, Apollodorus, and Epictetus; and, in Latin, editions of Virgil and Tibullus; all illustrated with copious commentaries. His *Opuscula Academica*, in five volumes, contain a series of 116 academical dissertations, of which the most valuable are those respecting the antiquities of Etruscan art and history, and the researches regarding the colonies of Greece. He has left us also a great number of papers on almost every subject of erudition, more especially on ancient mythology, amongst the *Commentationes Societatis Regiæ Gottingensis*. His *Antiquarische Aufsätze*, in two volumes, comprise a valuble collection of essays on different subjects connected with the history of ancient art. In the earlier part of his life he translated, or rather wrote anew, a great part of the *Universal History*.

After this notice of the chief events of his life, and of his literary productions, it may be proper to say somewhat in regard to the distinctive merit which has raised Heyne to so eminent a place amongst the promoters of classical literature. And here it is chiefly as an interpreter of the ancient poets, and as an original investigator of the ancient mythology, that he must rest his claims to the celebrity he has acquired. As a critic of the works of art, his desert is great, but he has no pretensions to original or peculiar discoveries.

The example of the great philologists of Holland, and the more immediate influence of Ernesti and Gesner on the taste and pursuits of their countrymen, had, before the middle of the last century, awakened in Germany a new zeal for the study of the ancient authors, and had advanced the criticism of classical literature to a rapid and vigorous maturity. The great writers of antiquity ought not, however, to be read with a regard limited merely to their language; they more especially deserve a close and enthusiastic study, for the admirable means which they afford of improving the understanding and of cultivating the taste. From the year 1760, about which period the Germans had begun to devote themselves, with an enthusiasm as zealous as it was tardy, to the cultivation of their native language and literature, several intelligent philologers displayed a more refined and philosophical method in their treatment of the different branches of classical learning; and, without neglecting either the grammatical investigation of the language, or the critical constitution of the text, no longer regarded a Greek or Roman writer as a subject for the mere grammarian and critic, but, considering the study of the ancients as a school for thought, for feeling, and for taste, they initiated us into the great mystery of reading everything in the same spirit in which it had originally been written. They demonstrated, both by doctrine and example, in what manner it was necessary for us to enter into the thoughts of the writer, to pitch ourselves in unison with his peculiar tone of conception and expression, whether erroneous or correct, and in every instance accurately to investigate the circumstances by which the mind of the poet or philosopher was affected, the motives by which he was animated, and the influences which co-operated in giving the intensity and character to his feelings. It was shown how generally the conception of the reader was merely a veil thrown over the thought of the original. It was no longer allowed to combine modern with ancient ideas, to convert the derivative with the original thought, or to translate it by a new and factitious signification. At the head of this school stands Heyne, both as its founder and principal ornament; and, however some of his disciples may have exposed themselves to ridicule in their application of the principles on which this system of interpretation rests, yet it cannot be denied that nothing has contributed so decisively to maintain and promote the study of classical literature, as the combination which Heyne has effected of philosophy with erudition, both in his commentaries on the ancient authors, and in those works in which he has illustrated various points of antiquity, or discussed the habit of thinking and spirit of the ancient world.

The comparative poverty of Germany in ancient manuscripts has compelled her scholars to rest satisfied in general with the critical apparatus which the philologers of other nations have collected. What they necessarily wanted in the originality of subsidiary stores, they have, however, endeavoured to supply, by a sound and rational employment of those already compiled; and the praise of useful diligence cannot certainly, with justice, be denied to their labours in this department. Originality, however, was possible in the *higher* criticism, which does not rest on the collection of readings or the authority of manuscripts, and in the mode of the illustration applied to the ancient writers; in these respects the later philologers of Germany have earned a glory peculiar to themselves, and which must be remembered as long as learning and ingenuity are respected. How cogently have they reasoned on the authenticity or spuriousness of particular writings, and how skilfully have they applied the test to the interpolations of later times; to what new conclusions are we now brought in regard to Orpheus, Homer, Anacreon, Longinus, &c., by the critical investigations of Schneider, Wolf, Fischer, Hermann, Weiske, and others; how differently has the controversy in regard to the authenticity of certain orations of Cicero been latterly concluded by Wolf, compared with the result of Markland's and Gesner's speculations. In this department Heyne does not, however, hold the same pre-eminence which he has attained as an enlightened and popular interpreter; for though his discussions in the higher criticism are both numerous and valuable, he is as much surpassed in boldness and originality by Wolf, as he is inferior to Hermann in the minuteness and subtilty of his reasoning.

There is, however, another department in which the labours of Heyne are more original, and here he merits all the honour to which a discoverer is entitled. Until the middle of the eighteenth century, mythology was nothing else than the nomenclature of divinities, a collection of the manifold and discordant legends of their several relations, actions, and destinies, and the delineation of their forms from the works of the poets and artists, illustrated, perhaps, by a mystical and allegorical commentary. About this period some more profound thinkers began to regard the mythical traditions in a higher view, as sources of human history; but, from too confined an acquaintance with the circumstances and condition of the ancient world, they took too high a standard for their explanations, and, through a mystical and allegorical interpretation, thinking they had discovered, under the veil of mythological narration, ideas of the deepest wisdom, they confidently framed thereon hypotheses for the history of mankind, for the arts, for philosophy, and for the other sciences, which threatened altogether to extinguish the glimmering light that was still afforded us for the periods of remote antiquity.

Heyne opened a less ambitious but more certain path. Following the observations which travellers had collected in regard to new and uncivilized nations, he applied these to the condition of the Greeks, who, as history informs us, from a rude and sensual barbarism, had gradually advanced to a state of civilization and intellectual refinement. He thus arrived at the simple conclusion, that the mythical tales of antiquity contain the first attempts at reasoning, the most ancient history, philosophy, and theology embodied in a poor, unformed, and consequently figurative language; and, therefore, that mythology is a system comprehending partly the original form of representation through objects of sense peculiar to a rude age, expressed in fables, ceremonies, and monuments, transplanted into later times; partly a kind of poetical apparatus derived and formed from this original mythology, and intended only by its authors for the purposes of poetical effect. He hence justly concluded that it is impossible to attain any real insight into the nature of mythical narration, unless the *mythi* of the most ancient poets are carefully distinguished from the abusive applications made of them in the poetry of after times, and unless mythology be kept separate from the philosophy conversant about mythology. In conformity with these fundamental rules, Heyne has illustrated Apollodorus; and in the same spirit he has conducted those researches into the nature and tendency of the different mythi of Greece, which he has published in the *Transactions of the Royal Society of Göttingen.* His views have been almost universally admitted to be correct in principle, and his applications to have been conducted with the most profound learning and almost unequalled ingenuity. A great number of followers have pursued the path he opened; and his theory has now attained the form and stability of a system, through the labours of his disciples. Amongst these, the names of Martin Hermann (not the philologer), of Voss, and of Manso, are especially to be distinguished. The theologians of Germany have likewise applied the same theory to the interpretation of the Sacred Books; and the researches of Eichhorn, Bäuer, Ilgen, Hartmann, Vater, De Wette, and a host of other philosophical divines, into the pretended biblical mythi, have been pursued with a learning and acuteness equalled only by the impious audacity of their conclusions. (W. H.)

HEYWOOD, John, styled the epigrammatist, from a work which he published under the title of *Six Centuries of Epigrams*, was born (it is not known in what year) at North Mims, near St Albans. He was educated at Oxford, and afterwards made the acquaintance of Sir Thomas More, who introduced him at court. His skill in music and his inexhaustible fund of ready wit made him a special favourite of Henry VIII., and afterwards of his daughter Mary;—and it is said to have been only pungent jesting that could move the laughter of two such persons. His *Interludes*, a kind of connecting link between the old moralities and the modern drama, were extremely popular in their day. These generally represented some ludicrous incident of a homely kind in a style of the broadest farce, and in their way displayed no mean skill and talent. One of these interludes, called *The Four P's*, describes a contest between a pedlar, a poticary, a palmer, and a pardoner, as to which of them shall tell the grossest lie. The palmer remarks that he never saw a woman out of patience in all his life; and his rivals, amid much jesting, confess themselves vanquished. Heywood's longest single work is an immense burlesque allegory, published under the title of the *Parable of the Spider and the Fly*. The spider symbolizes the Protestant party, the fly the Catholic. The allegory itself is an account of the conflict between the two parties, but so long-winded, intricate, and unintelligible that, in the words of an old critic, "neither he himself that made it, nor any one that readeth it, can reach unto the meaning thereof." On the accession of Queen Elizabeth, Heywood, who was a zealous Catholic, fled to Mechlin in Belgium, where he died in 1565.

HEYWOOD, *Thomas*, a voluminous English dramatist of the sixteenth and seventeenth centuries, was born in Lincolnshire, and was educated at Cambridge, where he became a fellow of Peter-house. The dates of his birth and death are alike unknown, and the few facts of his life that are known have been gleaned chiefly from his own writings. He is first found writing for the stage in 1596, and is known to have been using his indefatigable pen in 1640; indeed his last-published piece did not appear till fifteen years after that date. Heywood was an actor as well as a play-writer, and to these employments he superadded that of a miscellaneous author. He is believed to be the most voluminous of English writers, and on that score has been likened to Lope de Vega, Kotzebue, and Alexandre Dumas. Putting out of account his non-dramatic works, which fill many folio and quarto volumes, he describes himself as "having an entire hand or at least a main-finger in two hundred and twenty plays." Of these only three-and-twenty survive, but they amply attest that had he chosen to concentrate instead of diffusing his powers, he might easily have ranked with the Massingers, Fords, and others of his great contemporaries. His facility and variety are almost without a parallel, his fancy was inexhaustible, and his invention boundless; but his taste was bad, and he delighted to excess in what he called "merry accidents, intermixed with apt and witty jests;" or, in other words, the broadest and coarsest farce. Many of the songs interspersed throughout his plays were singularly sweet and graceful. His best pieces, such as *A Women Killed with Kindness; The Four Prentices of London; The English Traveller; A Challenge for Beauty;* and *Love's Mistress*, lie chiefly in the department of what has been called the domestic tragedy, in which he is in some respects at least superior to Lillo. Charles Lamb hits his character in a single sentence:—"Heywood is a sort of prose Shakspeare; his scenes are to the full as natural and affecting; but we miss *the poet*—that which in Shakspeare always appears out and above the surface of *the nature*."

HICKES, George, was born at Newsham in Yorkshire in 1642. He finished his studies at Oxford with great applause, and took the degree of A.M. This honour was likewise conferred upon him by Cambridge. For seven years thereafter he fulfilled the duties of lecturer in Lincoln College. His health having been impaired by close study, he accompanied his pupil, Sir George Wheeler, to France, to recruit. Upon his return he graduated in divinity at Oxford in 1675, and was appointed rector of St Ebbe.

This was followed by his becoming chaplain to the Duke of Lauderdale. At the breaking out of the Revolution in 1688 he adhered steadily to the cause of the dethroned James II., and lost all his benefices. Protesting vehemently, by placard affixed to the door of Worcester Church, against his being ejected, he retired to London, where he remained for several years in concealment. After undertaking a difficult mission to the banished king regarding the affairs of the church, Hickes, upon his return, was appointed suffragan Bishop of Thetford. His vehemence in the royal cause would have exposed him to danger had not the Chancellor Somers, in admiration of his great talents, exerted his influence to shield him. He died in the 74th year of his age, A.D. 1715.

Hickes was a voluminous writer. His theological and controversial works are sinking into oblivion. His fame rests upon his philological writings. His *Institutiones Grammaticæ Anglo-Saxonicæ et Mœso-Gothicæ*, &c., afford the first methodic arrangement of the grammatical rules of the Anglo-Saxon language. His *Antiquæ Literaturæ Septentrionalis, libri duo*, &c., 2 vols. folio, Oxon. 1705, long remained as the most complete work on ancient northern literature and languages.

HIDAGE (*Hidagium*) was an extraordinary tax payable to the kings of England for every *hide* of land. This tax was levied in money, provision, armour, and other articles; and when the Danes landed in Sandwich in 994, King Ethelred taxed all his lands by hides, so that every three hundred and ten hides found one ship furnished, and every eight hides furnished one jack and one saddle, to arm for the defence of the kingdom. Sometimes the word *hidage* was used to signify exemption from that tax; and this immunity was also called *hidegild*, and interpreted, from the Saxon, a price or ransom paid to save one's skin or hide from beating.

HIDALGO (*hijo d'algo*, son of somebody), an obsolete title of nobility in Spain; in Portuguese, *fidalgo*.

HIDJELLEE, a town and district of Hindustan, province of Bengal, on the W. bank of the Hooghly River. It is the first town which is seen after entering the river. Here ships formerly used to anchor, but they now run up to Kedjeree or Diamond Harbour. There is here an extensive salt manufactory belonging to government. This place is very unhealthy. It was to Hidjellee that the English retreated in 1687, after escaping from Hooghly. They fortified the island, and held possession of it for three months, against all the efforts of Aurungzebe, till peace was concluded. The vicinity abounds with tigers, and the creeks with sharks and alligators. E. Long. 87. 50., N. Lat. 21. 50. The district is bounded E. by the Hooghly, and S. by the sea. Some of the land is good, and produces a great quantity of rice, cocoa-nuts, betel-nuts, &c. Area of district, 1014 square miles. Pop. 133,265. Its chief towns are Hidjellee and Contai.

HIERAPOLIS, *in Ancient Geography*, the name of several cities, of which the most important were those in Phrygia and Syria.

Hierapolis, in Phrygia, stood on a small tributary of the Mæander, from which it was distant 15 or 20 miles, and was 5 miles N. of Laodicea. It was celebrated for the worship of Cybele, here celebrated with great pomp, for its warm springs, which formed stalactites sometimes attaining an immense size, and for its Plutonium. This was a large cave, from a fissure in the floor of which exhaled a noxious vapour, said to poison all who breathed it except the priests of Cybele. The city was probably founded by the Greeks, though the history, alike of its rise and of its decay, is unknown. Its ruins, which are near a place called Pambuk-Kalessi, have often been visited and described by modern travellers, who likewise describe the extant stalactites, some of which have now reached the size of small hills.

Hierapolis, or (as it was called by the natives) *Bambyce*, in Syria, obtained its name of "the sacred city" from having been the principal seat of the worship of the Syrian goddess Astarte. It was the most important city in the district of Cyrrhestice, and was about 22 miles distant from the right bank of the Euphrates. Under the Seleucidæ it became a great commercial mart from its being on the great highway between Antioch and Seleucia. The Emperor Constantine made it the capital of the province Euphratensis, and it plays a conspicuous part in the Eastern campaigns of Julian; but with the establishment of Christianity and the abolition of the old worship, Hierapolis fell into insignificance and decay. Its ruins were in modern times first discovered and described by Maundrell, but the position of the city was first accurately fixed by Col. Chesney in the course of his expedition. Of the ancient remains the most important are two temples, a larger and a smaller. The massive architecture of the larger one, splendid even in ruins, seems to point it out as the scene of the worship of Astarte. The other ruins are chiefly Mohammedan. The modern name of the place is *Kara Bambuche* or *Membigz*.

HIERAX, a bishop of Leontopolis towards the close of the third century, who expounded Scripture on allegorical principles, and attracted a number of followers, who from him were called Hieracites.

HIERO I. and II., kings of Syracuse. See Hieron.

HIEROCLES, the name of several Greek writers, of whom the most notable are the following:—

Hierocles, born at Alatanda, in Caria. He and his brother Menecles were considered the first orators of Asia Minor. Their exuberant and florid style is pronounced by Cicero far inferior to that of the Greek masters.

Hierocles, of Bithynia. He was the author of the fierce persecution of the Christians under the reign of Diocletian, at the beginning of the fourth century. At first he was a judge at Nicomedia, where his persecuting zeal raised him to the governorship of Alexandria. He wrote two books addressed to the Christians, in which he endeavoured to show that the Christian Scriptures were full of contradictions; and also that the miracles ascribed to Jesus Christ were equalled by those ascribed to Apollonius of Tyana. He was answered by Lactantius and Eusebius. He is sometimes confounded with Hierocles the Platonic philosopher.

Hierocles, the neo-Platonic philosopher, had a flourishing school at Alexandria in the beginning of the fifth century, and was greatly admired for his ease and elegance of style. The works ascribed to him are:—1. A Commentary on Providence and Fate, and the Agreement between Divine Government and Human Liberty, in seven parts. Mere fragments of it are all that now exist. He reasons in favour of human liberty of will by supposing the pre-existence of the soul. He denies the eternity of matter. 2. Philosophical Maxims, preserved in the shape of extracts in Stobæus. 3. A Commentary on the Golden Verses of Pythagoras. This has come down to us entire, and is valuable as giving us a view of the Pythagorean philosophy. The best edition of it is by R. Warren. London, 1742.

HIEROGLYPHICS.

Introduction.

INTRODUCTION.

The object of the present essay is to give a concise account of the language of the ancient Egyptians and of the written characters by which it was expressed, from the age of the Great Pyramid to the third century after the Christian Era. Many valuable works have been written on various portions of this subject, but they have been addressed rather to a small body of students than to the learned generally. It has seemed therefore desirable to place before every scholar the means of forming an independent judgment respecting the method of interpretation originated by Young and Champollion, and this may be best done by as complete an account of the results of their method as can be comprehended within the limits of this article, with the addition of corroborative facts.

It is upon the results of the interpretation of hieroglyphics that its truth mainly depends. If those results be correct, the lost Egyptian history has been restored, and we have been made acquainted with the manners of the Egyptian people from the patriarchal times. Formerly we were obliged to look, as to a historical narrative, to the uncertain statements of Herodotus, who candidly told us not to trust to what he related on the authority of others;[1] statements rendered more doubtful by their abounding in positively fabulous or glaringly inconsistent matter. We were forced to endeavour to find some traces of truth in the careless and uncritical compilation of Diodorus Siculus, and to construct a history from the dry lists of Manetho, preserved by inaccurate or falsifying editors,[2] in forms self-contradictory and contradicting one another. Others who wrote in Greek and Latin had indeed preserved a few traditionary tales, which had come down to us in the last stage of a series of corruptions. In the Bible indeed are found some remarkable notices of Egypt, throwing great light upon the manners of the inhabitants at different times, but from which little historical information could be obtained without a previous knowledge of the history itself. From these materials arose a variety of histories of Egypt, no one of which was connected, and most of which contained, if the recent discovery be true, repetitions of the same king, on account of the different forms in which his name was given. In truth, all that was known of the earlier history was that Mênês was said to have founded the kingdom at some time between 17,000 and 2000 years B.C.—according to various authorities—that certain kings, as to whose time of rule there was a great discrepancy, built the most celebrated pyramids, and that some isolated sovereigns had been famous as warriors or lawgivers. It was not until the seventh century B.C. that any connected history began, and yet the most moderate computations assigned to the Egyptian kingdom or kingdoms a duration before that time of more than 1400 years. So vague, indeed, was the knowledge respecting this time of darkness, that it was not determined whether there had been but a single monarchy or whether Egypt had been ruled at any time by contemporary sovereigns. The best scholars generally scouted the idea of contemporary dynasties, yet now there is scarcely any one who maintains that there was but a single monarchy. Of the Pharaohs mentioned in the Bible, the later ones alone—Tirhakah the Ethiopian, Necho, and Hophra—had been identified with those mentioned by profane writers; and the chief part of what was said in the Sacred Records could not be attached to any portion of the Egyptian history derived from other sources. The manners of the people were better known, both from these various authorities and from the sculptured and painted monuments of the country; but these materials were not enough to enable us to understand the national character. From these sources, moreover, there could not be formed any very clear view, since most of what the Bible contains respecting the Egyptians refers to the time when the Israelites were in Egypt, a time at which the population was much mixed with Semitic or other colonizers,[3] and to the part of the country in which dwelt most of the strangers, and since the Greek writers speak of periods when the nationality of the inhabitants was greatly changed.[4] If the interpretation of Young and Champollion be true, we have contemporary historical and religious monuments of almost every century from the third after that in which ruled the first king of Egypt.[5] From the evidence of these monuments the chronological differences have been so greatly reduced, that the best authorities disagree at the utmost about 1000 years as to the earliest period, and are comparatively almost agreed with respect to the age of the Twelfth Dynasty, variously held to have commenced from twenty-seven to twenty-one centuries before the Christian Era. Not less satisfactory, though very

---

[1] Few writers have been more careful than Herodotus in warning their readers to discriminate between what is related on personal authority and what is derived from others. Thus, after describing Egypt, and before speaking of its history, the very part to which we have alluded above, he says,—Μέχρι μὲν τούτου. ὄψις τε ἐμὴ καὶ γνώμη καὶ ἱστορίη ταῦτα λέγουσά ἐστι· τὸ δὲ ἀπὸ τοῦδε, Αἰγυπτίους ἔρχομαι λόγους ἐρέων, κατὰ τὰ ἤκουον· προσέσται δὲ αὐτοῖσί τι καὶ τῆς ἐμῆς ὄψιος, ii., 99. In the narrative which follows this, the historian plainly states his method throughout the work,—ἐμοὶ δὲ παρὰ πάντα τὸν λόγον ὑπόκειται, ὅτι τὰ λεγόμενα ὑπὲρ ἑκάστων ἀκοῇ γράφω, ii., 123. In a much later place he repeats this avowal of his system,—Ἐγὼ δὲ ὀφείλω λέγειν τὰ λεγόμενα, πείθεσθαί γε μὲν ὦν οὐ παντάπασι ὀφείλω· καί μοι τοῦτο τὸ ἔπος ἐχέτω ἐς πάντα τὸν λόγον, vii., 152. It was therefore absurd and unfair to receive, as did most critics until recently, much that Herodotus evidently related on hearsay evidence as true because of their conviction of his veracity, which had nothing to do with that of his informants; and it was equally unjust of a more recent school to cast doubt upon all he related, because his history had been before received with an indiscriminating confidence.

[2] In saying this we would not be supposed to cast any slur upon Africanus, Eusebius, or Josephus; but we think that there can be no doubt that the discrepancies between what they have stated on Manetho's authority must be, at least in the case of Eusebius' version, the result of a deliberate falsification. We have a similar instance in the differences between the present Hebrew text of the Pentateuch, and the Septuagint and Samaritan versions, as to the lengths of the patriarchal genealogies before Abraham, which must have arisen, in two of the three cases, from systematic alteration, effected probably with the same object that induced the falsification in part of Manetho's lists. It does not follow that this was in each case the work of the Alexandrians.

[3] The existence of a large foreign population in Egypt at the time when the Israelites were there in bondage appears from various statements in the Bible.

[4] The Egyptians, however liberal they may have shewn themselves towards other nations, evidently were exclusive with the Greeks; and therefore several instances of the adoption of the manners of the latter people, and even of intermarriage with them, mentioned by Herodotus, shew indications of change even in his time. Besides, the Greek visitors associated chiefly with Greeks and Hellenized Egyptians.

[5] This is said on the supposition that the writer's explanation of Egyptian chronology, as given in *Horæ Ægyptiacæ*, and the article EGYPT, is correct. It will, however, be applicable, with some modification, to the longer schemes of chronology.

unexpected, has been the bearing of this history on the statements of ancient writers. The lists of Manetho, who certainly might have been supposed to have possessed very complete and accurate information, have been signally confirmed, and we have even been enabled to restore some parts of them, where they are corrupt, to their original purity, or at least to do somewhat towards effecting this. The veracity of Herodotus has not suffered, but we have become somewhat more careful in accepting what he has related on hearsay evidence. The biblical narrative has received much illustration, and some advance has been made towards the synchronism of Hebrew chronology with Egyptian. In the matter of arts and sciences much new information has been obtained, and the representations of the monuments have acquired an additional value from our having been enabled to fix their dates at least relatively. The congruity of these results, their reasonableness, and their unexpected character, afford no little evidence of the truth of the system by which they have been obtained.

The results of Young's and Champollion's discoveries, with respect to the ancient state of the countries bordering on Egypt, are, if true, of great importance in affording us an insight into their condition at remote periods from contemporary monuments, and thus adding a new set of authorities to the scanty materials for their history. The information that has been thus acquired has tended to confirm reliable records, and has extended our knowledge, not alone of the public affairs of the peoples to which it relates, but also even of their manners and civilization. Nevertheless, our ignorance of ancient geography has so embarassed these inquiries, that much remains to be done, and more may be reasonably hoped as to the future than has been accomplished in the past.

The most remarkable effect of these discoveries, in their whole extent, has been their influence on historical criticism and the kindred branches of knowledge, from which we may not unreasonably argue their truth. A better school of critics has arisen, and almost all scholars have been content with sounder and more moderate views than had before prevailed. Some may indeed ascribe this improvement to other causes, but if they compare the best works on Egyptian matters published before Young's time with those that have since appeared, they must confess that they see a very marked difference of method traceable to the different bases on which the writers have argued. This influence is, however, nowhere more distinctly evident than in the brilliant discoveries of Sir Henry Rawlinson, Dr Hincks, and others. Their method is based on that pursued by the interpreters of hieroglyphics, and if the method be false with respect to these latter, it must in like manner be so with respect to the cuneiform characters, and the results of the interpreters of both be equally visionary conjectures.[1]

It is not easy, therefore, to form a just estimate of the importance of a discovery from which such extraordinary results have been deduced, nor can an inquiry into its truth be lightly set aside, when we perceive what would be the consequences of its abandonment. We should have to unlearn the alphabet of our criticism, to burn many of the most valued works of the last few years, or to use them with suspicion, and to begin afresh from the point to which our fathers had attained, having gained nothing but a rooted historical scepticism. An essay, then, which should give the fullest means of judging this question would be of no slight use, and the present article is intended to supply the want. This may be best done, not by a laboured argument for the system of interpretation, or a detailed examination of what has been urged against it, but by a simple account of the progress and results of the discovery, principally as they relate to the Egyptian language.

No small incitement to the examination of this question and the prosecution of the study by those who may be convinced that they can proceed on sure grounds, may be derived from the promise it affords of further discoveries of greater extent and importance than those which have been already made in the same province. If, from a partial reading of some of the inscriptions, and a yet more partial reading of a few of the papyri, such great results have been obtained, what might not be expected from a fuller examination of more ample materials? We have good reason to anticipate that the clearest light will be thrown upon the state of science among the Egyptians when the most famous pyramids were built, 4000 years ago, that we shall become acquainted with the details of their history from that time, without any great interruption, until the close of the native monarchy, and that most important additions will be made to our knowledge of the early history of the Jews, the Phœnicians, the Greeks, and other nations with whom the Egyptians were brought in contact by war or by trade. The simple fact that it is asserted by some of the best scholars of our day that we can read in Egypt inscriptions more than 4000 years old, contemporary with the events which they record, should stimulate inquiry, and excite for them greater interest than for any other of man's monuments.

Plan of the article.

The first section of this essay will contain a definition of the Egyptian systems of writing, and an account of the means of interpreting them afforded by the Coptic language, the statements of ancient writers, and the ancient Egyptian records. The second section will explain the method of Young, Champollion, and their followers, with a summary of its main results, and the chief reasons for its correctness, which may be deduced from various evidence, chiefly external. In this section the whole of Young's treatise, so far as it relates to the interpretation of the Rosetta Stone, will be reprinted from the fourth volume of the *Supplement* to this *Encyclopædia*, published in 1819, for it has been judged right to maintain this document intact, both in justice to the author and on account of its own importance. The third section will be devoted to a sketch of the grammar of the sacred dialect, expressed by the Hieroglyphic and Hieratic characters; while the principal differences of the vulgar dialect, expressed by the Demotic characters, will form the subject of the fourth and concluding section. In these two sections the object will be rather to point out the main characteristics of the Egyptian language, and to dwell upon those distinctive peculiarities that guide the comparative philologer, than to enter into minute details of interpretation. The essay is, as has been previously stated, especially addressed to the general scholar, who is invited to examine inquiries, which, from the manner in which they have been treated, have hitherto been almost confined to a very limited class.

The woodcuts (exclusive of Dr Young's) which are introduced are merely intended to explain the text. Their selection and the positions in which they have been placed have been determined by this explanatory intention alone.

SECTION I.

THE HIEROGLYPHIC, HIERATIC, AND DEMOTIC SYSTEMS OF WRITING, AND THE MATERIALS FOR THEIR INTERPRETATION.

Since the different systems of writing which prevailed among the ancient Egyptians are merely adaptations of the same principles, varying chiefly in their appearance and their use, they can be best explained by tracing their origin and history before offering definitions of each of them.

---

[1] The argument, here given in outline, is more fully stated in the latter part of the second section of the present article.

History of the Egyptian systems of writing.

Although there is reason to suppose that the most ancient kind of Egyptian writing of which we possess examples, the hieroglyphic, originated from pure picture-writing,[1] it will not be safe to attempt a description of anything anterior to the oldest hieroglyphic inscriptions. These are extant in the tombs near the Pyramids of El-Geezeh, and date about the time of the commencement of the Fourth Dynasty,[2] B.C. *cir.* 2440.[3] In them we find a combination of picture-writing with a phonetic system. The picture-writing was by means of what have been termed ideographic signs,[4] which represented real things by their figures, and ideal things by symbols. The phonetic characters were both syllabic and alphabetic—the syllabic being used for particular syllables alone, and sometimes abbreviated by the first character standing for the whole syllable, and the alphabetic being occasionally not arranged in the order of pronunciation, the medial vowel being placed after the consonant or consonants which it preceded in sound. Both systems were combined by the ideograph being used as a determinative,[5] usually following the word for which it stood, and, in a few cases, forming its first phonetic character; but most words were written either by ideographs alone, or phonetically alone, while one of the two classes of characters was not exclusively employed in any inscription. The same continued to be the essential characteristics of the hieroglyphics down to the latest period at which they were employed, the time of the Roman Emperor Trajanus Decius, A.D. 249–252, notwithstanding certain changes which are noticed below (note 1). The earliest hieroglyphic writings are the inscriptions mentioned above, and no papyri have yet been found which can be assigned to the same period; nevertheless, as the character representing a roll of papyrus occurs in these inscriptions, there is no doubt that at their remote period records were preserved in books as well as on stones.[6] It cannot be determined, however, whether the hieroglyphic mode of writing was exclusively used for these books, or whether the hieratic had been already introduced.

Hieroglyphic system.

Rarely do we find the same characters employed without modification for any long period in the inscriptions and books of any nation. Those forms which most suit a stone wall, least suit the convenience of a scribe, especially when they abound in detail or ornament. The hieroglyphics, while they are particularly fitted for inscriptions, are, if not modified, most unsuitable to ordinary writing. First of all, what need would there be in the latter case to colour them either according to the natural colours of the objects which they represented, or of one uniform hue? Then, how could their minute details, rather ornamental than distinctive in their intention, be preserved when they were represented of a small size? We cannot wonder, therefore, that there arose what Champollion has named the *linear* hieroglyphics, in which the simplest forms and outlines of objects were alone given, or even these were further simplified, so as to be formed with one or two strokes. These characters, by being carelessly written, were soon corrupted into ruder forms, and hence originated the *Hieratic* system of writing, which stands in the same relation to the hieroglyphic, that our ordinary written hand does to our ordinary printed character. When the hieratic writing first came into use has not been determined. The rude quarry-marks on the stones of the Great Pyramid,[7] and of other pyramids,[8] certainly bear a strong resemblance to hieratic; but this resemblance is easily explained, if we suppose them to be scrawled hieroglyphics. It seems probable, however, from the nature of the case, that the hieratic system must have been invented soon after the hieroglyphic. The most ancient specimen of which the date is approximatively fixed by our knowing under what reign it was executed, was found on the mummy-cloth of a king[9] Nantef, probably of the Ninth Dynasty,[10] which began B.C. *cir.* 2200. Perhaps the hieratic inscription of the mummy-case of Queen Munthotp may be referred to the same period.[11] Both are undoubtedly of the time before the Eighteenth Dynasty, which began B.C. *cir.* 1525.[12] The difference between the hieroglyphic system and the hieratic, besides that of the form of the characters, is not great, and may be traced to the desire to render the inscriptions of the temples and tombs as ornamental as possible, which was not felt with respect to the hieratic manuscripts. Hence the use of phonetic characters was more prevalent in the latter, and the grammatical forms were more usually expressed, though the advantage that we should expect to gain from these circumstances is outweighed by the careless manner in which the characters have been written, rendering their interpretation often extremely difficult.[13] It must not be supposed that the hieratic system alone

Hieratic system.

---

[1] The circumstances that we find the earliest Egyptian inscriptions to contain a larger proportion of ideographic signs than the later, and that this proportion, for the most part, constantly decreased in subsequent times, and, moreover, that the arrangement of the characters shews a greater regard for appearance in these oldest records, all tend to support the opinion that the Egyptian hieroglyphics had their origin in picture-writing. The nature of these hieroglyphics strongly confirms this opinion, no less than do the prevalence of systems of picture-writing among existing savage nations, and the undoubted origin of more than one ancient method of writing from such a system.

[2] The greatest number of inscriptions of this period which have been published are given by Lepsius in his *Denkmäler aus Ægypten und Æthiopien*, Abth., ii., Bl. 1, *et seqq.*

[3] See *Horæ Ægyptiacæ*, p. 223. Some, and particularly Bunsen and Lepsius, carry this date about a thousand years earlier, while scarcely any one possessing any acquaintance with the interpretation of hieroglyphics brings it down to a later period than the twenty-fifth century B.C.

[4] The term "ideographic" must be understood in a metaphysical sense, since it comprehends signs for real as well as for ideal things.

[5] This word "determinative" is retained for lack of a fitter. "Restrictive adjunct" would suit better in most instances, but is not applicable in all cases.

[6] This is observed by Lepsius in speaking of the papyrus:—"Ihre Benutzung lässt sich in Ægypten bis in die ältesten Zeiten zurück nachweisen; die Papyrusrolle und die Schreibapparat finden sich bereits auf Monumenten der vierten und fünften Dynastie, also im vierten Jahrtausend vor Christus" (*Chronologie der Ægypter*, vol. i., p. 33). Manetho tells us that Athôthis, the second king of the First Dynasty, wrote "books on anatomy," which would seem, if Africanus's version be more accurate than that of Eusebius, to have been in existence in the time at which the Egyptian historian lived. *Οὗ φέρονται βίβλοι ἀνατομικαὶ* (Afr.) *Βίβλους ἀνατομικὰς συνέγραψεν* (Eus. Gr.) Libros de ratione secandorum corporum scripsit (Id. Arm. *trans. Mai.*) Manetho also ascribes to Sûphis [I.] of the Fourth Dynasty, builder of the Great Pyramid, the writing of "the sacred book." Such evidence might almost make us say with Pliny, "Ex quo apparet æternus literarum usus" (*Hist. Nat.*, lib. vii., c. 57).

[7] Vyse's *Pyramids of Gizeh.* Fol. plates, pls. v., vi., vii.; and 8vo, vol. ii., pl. facing p. 15.

[8] Vyse's *Pyramids of Gizeh*, vol. iii., p. 13, and pl. facing p. 14.

[9] Thebes, 1848, MS. Notes of the Writer.

[10] *Horæ Ægyptiacæ*, p. 227. Some hold this king to have been of the Eleventh Dynasty; but by doing so, do not much alter his date. It is generally admitted that the line to which he belonged, whether Manetho's Ninth or Eleventh Dynasty, immediately preceded the Twelfth, the commencement of which is usually placed not earlier than the twenty-fourth century B.C., nor later than the beginning of the twenty-first. At least one other king of the same name seems to have ruled as late as shortly before the Eighteenth Dynasty.

[11] Copy by Sir Gardner Wilkinson, presented by him to the Department of Antiquities of the British Museum.

[12] *Hor. Æg.*, p. 198.

[13] The scrupulous accuracy of the monumental inscriptions would lead one to suppose that the papyri would be carefully written,

was used for the class of records to which it doubtless owed its origin, the papyri, for some have been found written in linear hieroglyphics, and others even in characters little or not at all less finished than those of the inscriptions. Historical manuscripts, however, appear to have been always written in hieratic characters, and the many that we possess render a study of these characters second only in importance to that of the hieroglyphics. It does not certainly appear when the hieratic writing ceased to be used; but most of the specimens extant are not later than the time of the Twentieth Dynasty, which began B.C. *cir.* 1220: from the famous passage of Clemens Alexandrinus on the Egyptian systems of writing, we may infer, though not necessarily, that hieratic was still employed when he wrote (A.D. *cir.* 200), and certainly that it was studied by the priests. The circumstance that the earliest demotic scarcely differs from the hieratic, except in the dialect it expresses, affords a strong argument to shew, that the latter was little used at the time of Psammitichus I., when we first find demotic writing.

Demotic system.

At the period of the Saïte kings of the Twenty-sixth Dynasty, if not before, a necessity had arisen for a character by which to express the vulgar dialect. Although there is no doubt that, in the earliest times, the written and the spoken language were the same, the intermixture with foreigners was not long in producing a debasement, which may be dated, if we believe a statement usually ascribed to Manetho, as early as when the shepherd-races were in Egypt.[1] The large importations of foreigners from the east and the south, if not from the west also, under the conquering sovereigns of the Eighteenth, Nineteenth, and Twentieth Dynasties, and their employment in the service of the temples,[2] as well as in constructing them, and in other public works, the maintaining of a mercenary force by those and later monarchs,[3] then the rule of the half-Assyrian or Babylonian Twenty-second Dynasty,[4] and the Ethiopian Twenty-fifth[5]—must have tended to produce what is usual in these circumstances with all languages, and inevitable to a system of characters elaborate in form, if employed by the great body of the people. It is very erroneous to suppose that among so civilized a nation as the Egyptian, learning was confined to the priesthood and the wealthy, and that the lower classes were altogether destitute of a knowledge of their written character.[6] The rude quarry-marks intended to guide the workmen as to their tasks are not erroneous, though carelessly executed, and they must have been meant for men who could understand their import. Besides, for whom was the equally complicated demotic invented, if not for the great body of the people? The religious character of the nation, their complicated mythology, and the importance which their various rites were held to possess, must have necessitated some knowledge of a system of writing, which is in part so addressed to the eye, that it would be impossible for one knowing the speech which it represented not to become somewhat acquainted with the meaning of its signs. The Egyptian language had therefore become corrupt, at least in the mouths of the common people, and a need of some manner of writing it in this state had arisen. The demotic or enchorial system was therefore formed by an adaptation, which soon became a degradation, of the hieratic, from which it differed mainly in expressing a debased form of the language, the vulgar dialect, but also in its signs being, except in its most ancient form, ruder in shape, and probably fewer,[7] and in a preference being given to phonetic characters over representations and symbols. The demotic system was chiefly used for legal documents and religious writings on papyrus, and sometimes, but very rarely, for inscriptions. In the latter case it was occasionally employed, as in the famous Rosetta Stone, to render a hieroglyphic inscription intelligible to the main body of the people. Hieroglyphics continued to be used, as already noticed, as late as in the third century of the Christian Era, not long after which time the demotic system seems to have been abandoned. Soon after the cessation of hieroglyphic writing, the Coptic alphabet appears to have originated, taking the place of the demotic system, for we can trace it back to about the fourth century. This mode of writing is naturally most connected with the demotic, since the language which it expressed differed but little at first from the vulgar dialect expressed by the demotic and, from being used for ecclesiastical purposes, was always preserved in its original form, though possessing three dialects, and since, moreover, it borrowed demotic characters for those sounds for which equivalents were not found in the Greek alphabet in which it was otherwise written. Before noticing the Coptic language, which must be done on account of its great importance as the chief means of interpreting the hieroglyphic, hieratic, and demotic systems, when once the sounds of

---

more especially those of the *Ritual.* Such, however, is far from the case; for the historical papyri are most carelessly written, and the copies of the *Ritual,* though executed with more pains, are remarkably different in wording, as if written both at dictation and from memory, and are not free from clerical errors.

[1] Ἐκαλεῖτο δὲ τὸ σύμπαν αὐτῶν ἔθνος Ὑκσώς, τοῦτο δέ ἐστι βασιλεῖς ποιμένες· τὸ γὰρ Ὑκ καθ' ἱερὰν γλῶσσαν βασιλέα σημαίνει, τὸ δὲ Σὼς ποιμήν ἐστι καὶ ποιμένες κατὰ τὴν κοινὴν διάλεκτον, κ. τ. λ. (*Jos. contr. Ap.*, lib. i., cap. 14). Since Josephus does not always quote Manetho verbatim, as appears from a subsequent place, where he says (cap. 26),—Κἄπειτα κατὰ λέξιν οὕτω γέγραφεν; and as in the present place, he appends a remark almost certainly his own—(τινὲς δὲ λέγουσιν αὐτοὺς Ἄραβας εἶναι)—besides that the infinitive is used with φησὶν in what follows this last citation, the etymology given above cannot be positively assigned to the Egyptian historian. It should also be remembered that subsequently Josephus gives, on the authority of Manetho, "in another book of the *Ægyptiaca,*" what must be regarded as a different etymology of the former part of this word (Comp. *Horæ Æg.*, pp. 182–184).

[2] See, for instance, Rosellini, *Monumenti Storici,* No. xlv., 1; and Mr Birch's paper on the Statistical Tablet of Karnak, *Trans. Royal Society of Literature,* New Series, vol. ii., p. 330.

[3] Comp. *Ancient Egyptians,* vol. i., pp. 389, 390.

[4] The importance of mercenaries under this line is shown by the fact mentioned by M. Mariette, in his "Renseignements sur les soixante-quatre Apis trouvés dans les Souterrains du Sérapéum" (*Bulletin Archéologique de l'Athenæum Français,* Oct. and Nov. 1855), that a king's son-in-law held the command of the Mashuash, these being foreigners in the service of the reigning Pharaoh.

[5] The rulers of this Dynasty may be supposed, from Sir Henry Rawlinson's recent discoveries, indicating a connection between the Asiatic and African Ethiopians, to have been of not dissimilar origin to the kings of the Twenty-second.

[6] Herodotus seems to speak of the great body of the people when he says,—Αὐτῶν δὲ δὴ Αἰγυπτίων, οἳ μὲν περὶ τὴν σπειρομένην Αἴγυπτον οἰκέουσι, μνήμην ἀνθρώπων πάντων ἐπασκέοντες μάλιστα, λογιώτατοί εἰσι μακρῷ τῶν ἐγὼ ἐς διάπειραν ἀπικόμην, ii. 77. On this passage Lepsius remarks: "Die letzten Worte beziehen sich nicht auf die geschichtlichen Ereignisse allein, sondern auf alle aufbewahrenswürdige Erfahrungen; Herodot meint, sie waren das litterateste Volk. Vom Gedächtniss ist nicht die Rede; das hatte ihnen Hermes, nach dem Ausspruche des Sokrates durch das frühe Geschenk der Schrift vielmehr verkürzt" (*Chronologie der Ægypter,* vol. i., p. 40, note 4). Herodotus thus clearly makes the Egyptians the most literary people with whom he had associated; and his own nation was then, we must remember, remarkable for the eagerness with which it cultivated letters. The contrary statement of Diodorus Siculus (lib. i., c. 81) cannot be of much value against the opinion of Herodotus.

[7] Since Dr Brugsch has discovered no more than 184 distinct demotic characters, excluding ligatures and numerals, or less than one-third of those found in hieroglyphics, most if not all of which have their hieratic forms, there seems little reason to doubt that the demotic list was more restricted than the hieratic (See *Grammaire Démotique,* Table A.B.). Our opinion is, however, in this particular at variance with Dr Brugsch's.

their characters are known, it will be necessary, in order to avoid confusion, to give definitions of these systems with the different names by which they have been called in ancient and modern times.

The Sacred Characters.

Definition of Hieroglyphics.

1. The *Hieroglyphic* characters, or *Hieroglyphics.*—Eg. " Writing of sacred words."[1] Gr. γράμματα ἱερὰ,[2] γράμματα ἱερογραφικὰ,[3] ἡ ἱερογλυφικὴ (γραμμάτων μέθοδος),[4] τὰ ἱερογλυφικὰ.[5] Lat. Hieroglyphicæ litteræ,[6] hieroglyphicæ,[7] hierographicæ litteræ.[8]

Fig. 1.

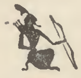

Fig. 2.

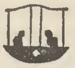

Fig. 3.

Fig. 4.

Fig. 5.

Fig. 6.

Delineations of material objects employed to denote ideographically real things by figures, the iconographic mode, as—(fig. 1) " an obelisk,"[9] (fig. 2) " a soldier;"[10] ideal things by symbols, the symbolic mode, as (fig. 3) " a panegyry," where the place of celebration stands for the thing celebrated;[11] (fig. 4) " to strike," where the act is represented by the agent (whence it is evident that some signs would be used both in a real sense and an ideal, according as they represented the agent or the act); or to represent sounds phonetically by characters, either syllabic, as (fig. 5) " MEN," " to establish, place,"[12] where the first character when written alone implies the second, or alphabetic, as (fig. 6) " SHUFU," or " KHUFU," the name of the second king of the Fourth Dynasty;[13] few signs being used in both classes, or in both kinds of the former class. These characters were written horizontally, from right to left, or from left to right; and vertically downwards, from right to left, or from left to right; but in either case from right to left by preference.

The following examples[14] will show the different modes of arrangement (fig. 7) :—

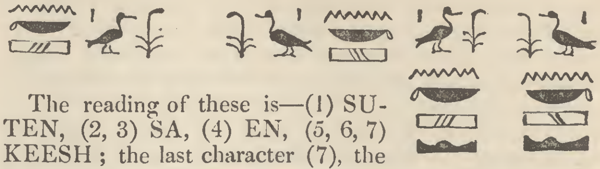

Fig. 7.

The reading of these is—(1) SUTEN, (2, 3) SA, (4) EN, (5, 6, 7) KEESH; the last character (7), the determinative of foreign geographical names, being omitted in the first and second examples. The arrangement may therefore be thus represented :—

```
4                   4   3 2 1     1 2 3
5  3 2 1    1 2 3   5     4         4
6                   6     5         5
                          6         6
                          7         7
```

The first character or group is that which is highest and nearest to the side towards which the characters of the inscription look, a rule to which very few exceptions have been observed.[15]

Definition of Hieratic.

2. The *Hieratic* characters, Gr. ἡ ἱερατικὴ (γραμμάτων μέθοδος).[16]

A cursive form of the hieroglyphic method of writing, usually written horizontally from right to left, as (fig. 8) " the king of Upper and Lower Egypt, Unas,"[17] the last sovereign of the Fifth Dynasty.

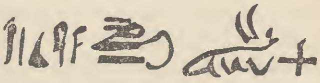

Fig. 8.

The Vulgar Characters.

Definition of Demotic.

The *Demotic* or *Enchorial* characters. Eg. " Writing of books."[18] Gr. γράμματα ἐγχώρια,[19] γράμματα δημοτικὰ,[20] γράμματα δημώδη,[21] ἡ ἐπιστολογραφικὴ γραμμάτων μέθοδος.[22]

[10] The corresponding phonetic word, of which it is the determinative, is MASH. Chevalier Bunsen supposes its signification to be " an archer " (*Egypt's Place*, vol. i., pp. 471, 503), although he makes its variant, the standing figure, to signify " soldier, archer" (p. 498), but it means simply a foot-soldier, being employed in apposition to " horse " (ex. gr. *Select Papyri*, pl. xxiv., lib. 1), by which term, when used of an Egyptian army, the chariot-force seems always intended; and this may explain the employment of " horsemen " in the Bible for that force, except auxiliary horse be meant, for the Egyptians appear to have had no native cavalry. It should also be noted that the Coptic corresponding words do not indicate the meaning of archer, but simply of warrior. The archer's figure was chosen since most of the Egyptian troops carried bows. So in the Bible we read,—" The children of Ephraim, armed of the archers, turned back in the day of battle." (Ps. lxxviii. 9; comp. 2 Chron. xvii. 17.) The root MASH may be compared with the Greek *Μάχη*.

[11] The HEEB has been called a panegyry, since it is so translated in the Greek inscription of the Rosetta Stone, and evidently by Herodotus (ii. 58, 59); and it seems undesirable to alter a rendering that has been universally adopted. Nevertheless the *πανήγυρις* of the ancient Greeks was properly very different from the Egyptian HEEB. The former was, as its etymology indicates, an assembly of the whole nation particularly for games, or an assembly held at the games or at other great festivities. Thus, Agamemnon is made by Æschylus to promise any needed redress of wrongs to his people at the approaching panegyry (*Æsch. Ag.* v. 853, ed. Schütz), where the ambiguity of the poet's language makes it doubtful whether the celebration of games is spoken of in connection with the panegyry or not (comp. the note of Schütz). The HEEB appears to have been properly a solemnity for the dead, since HEB (perhaps HEEB —the vowel being doubtful) signifies to " lament the dead—a funeral lamentation;" and in the earliest inscriptions, which it should, however, be recollected, are almost exclusively in tombs, it is used alone for festivals of the gods for the deceased. In the inscriptions of temples and the like, of somewhat later, and much later times, this word is employed for the festivals of gods celebrated in the temples, and for the king's festivals; and the great hypostyle halls of the temples were especially devoted to such celebrations. They had, however, a strictly religious character, and there is no distinct evidence to show that they were ever political councils. The Greek word would therefore be best rendered " assembly,"—the Egyptian " solemnity."

[12] Most of the syllabic characters are used alone for a single root and words derived from it, and this appears to have been their original use. Their initial letter, which is the principal one of the two or three of which they are composed, has sometimes a determinative power, and this was probably the case with all such letters originally. Hence arises the division of syllabic characters into the simply phonetic and the determinative-phonetic.

[13] This king, the Sûphis (I.) of Manetho (Africanus) and the Cheops of Herodotus, is recorded to have been the builder of the Great Pyramid, which, however, was probably the joint work of himself and Num-Shufu, Sûphis (II.), who appears to have been his co-regent. (See art. EGYPT.)—It is difficult to decide whether the alphabetic consonants have inherent vowels, when no vowels are expressed, as Dr Hincks has supposed (see his learned papers in the *Transactions of the Royal Irish Academy*, vol. xxi., pt. 2), and the reply of Chevalier Bunsen (*Egypt's Place*, vol. i., pp. 733, *et seqq.*), who nevertheless inclines to admit Dr Hincks's theory in some instances, as appears from his *Alphabet and Syllabarium* (Id., pp. 556, *et seqq.*) The constant writing of foreign names with the vowels would seem to favour the idea of their being inherent, but this is only *primâ facie* evidence, for the Arabs usually omit the vowel points except in difficult words or passages, as in poetry and the like.

[14] The examples in this essay are given in their original directions.

[16] *Clem. Strom.*, lib. 5.

[17] *Turin Papyrus of Kings*; ed. Wilkinson. There is great difference in the various " hands" in which we find hieratic written; the best most resemble the hieroglyphic, and the worst rather approach the demotic, the earliest form of which, indeed, differs from the hieratic in expressing the vulgar dialect rather than in its appearance. (Comp. *Brugsch's Grammaire Démotique*, pl. i.)

[18] Rosetta Stone, Hierog. Inscript. (Comp. *Gram. Dém.*, pp. 2, 3.)

[19] Inscr.

[20] *Herod.* ii. 36.

[21] *Diod.* iii. 3.

[22] *Clem. Strom.*, lib. v.

A debased form of the hieratic method of writing, differing from it mainly in expressing the vulgar dialect, but also in its signs being ruder in form, probably fewer, and in a preference being given to the use of phonetic characters over iconographic and symbolic. It was written from right to left, horizontally, as in the following example (figure 9), the name of Ptolemy from the Rosetta Stone.[1]

Fig. 9.

These definitions must be regarded as provisional, and the observations which have preceded them as hypothetical, in the present stage of the inquiry. It is, however, advisable to premise thus much in order to render what follows clear, and these premises will receive entire confirmation in the succeeding portion, of which they may indeed be regarded as the results.

elation of ncient gyptian o Coptic.

When anything written in cipher is placed before one to be deciphered, his first inquiry is what language it conveys. Before attempting to read the Egyptian characters, our first step must be to ascertain from other sources, if possible, the language they express. We find by the Rosetta Stone that both hieroglyphic and demotic were in use as late as the time of Ptolemy Epiphanes, on the 27th March (Jul.) of whose 9th year (B.C. 196)[2] the decree on that monument is dated, and we can trace up Coptic to the fourth century of the Christian Era, so that there is an interval of not more than about 600 years from the latest hieroglyphic and demotic writing to the earliest Coptic, which, it should be observed, is identical with the later Coptic. We cannot doubt, therefore, that the vulgar dialect expressed by the demotic characters of the Rosetta Stone differed from the Coptic but little. The sacred dialect must have differed from the latter somewhat more. The essential identity of the two can, however, be satisfactorily proved by the etymology given by Greek and Latin writers of certain Egyptian words, which must have belonged from their nature to the sacred dialect, and which may be equally derived from Coptic.

Thus, among names of divinities, Plutarch gives us two etymologies of that of the chief god of Thebes :—*ἔτι δὲ τῶν πολλῶν νομιζόντων ἴδιον παρ' Αἰγυπτίοις ὄνομα τοῦ Διὸς εἶναι τὸν 'Αμοῦν (ὃ παράγοντες ἡμεῖς Ἄμμωνα λέγομεν), Μανεθὼς μὲν ὁ Σεβεννίτης τὸ κεκρυμμένον οἴεται καὶ τὴν κρύψιν ὑπὸ ταύτης δηλοῦσθαι τῆς φωνῆς· Ἑκαταῖος δὲ ὁ 'Αβδηρίτης φησὶ τούτῳ καὶ πρὸς ἀλλήλους τῷ ῥήματι χρῆσθαι τοὺς Αἰγυπτίους, ὅταν τινὰ προσκαλῶνται. προσκλητικὴν γὰρ εἶναι τὴν φωνήν. κ. τ. λ.*[3] The former of these two etymologies, resting on the high authority of Manetho, the Egyptian historian (B.C. 300), is doubtless from the sacred dialect. In Coptic the word ⲁⲙⲟⲛⲓ signifies "to hold, retain, put round (clothing), prohibit, hidden things," &c., and ⲁⲙⲟⲩⲛⲓ, "hidden things." The derivation of Hecatæus of Abdera is only useful as indicating that the vulgar dialect of his time was similar to the Coptic, in which we find the word ⲁⲙⲟⲩⲛ, meaning, in the Sahidic dialect, "come." Respecting names of Isis, the same writer (c. 56) from whom we have quoted above says,—*Ἡ δ' Ἶσις ἔστιν ὅτε καὶ Μούθ, καὶ πάλιν Ἄθυρι καὶ Μεθύερ προσαγορεύεται· σημαίνουσι δὲ τῷ μὲν πρώτῳ τῶν ὀνομάτων, μητέρα· τῷ δὲ δευτέρῳ, οἶκον Ὥρου κόσμιον. . . τὸ δὲ τρίτον σύνθετόν ἐστιν ἔκ τε τοῦ πλήρους καὶ τοῦ αἰτίου. κ. τ. λ.* In Coptic we have ⲙⲁⲩ, "a mother," which with the sign of the feminine, which was usually written, and evidently sometimes expressed in pronunciation, by the ancient Egyptians, would be MAUT, MAUTH. The abode of Horus, in Coptic, would read ⲏⲓⲛ̀ϩⲱⲣ, where, if we discard the preposition ⲛ̀, there remain ⲏⲓ and ϩⲱⲣ. The Copts would, however, rather have written ⲙⲁⲛ̀ϩⲱⲣ. The third derivation probably cannot be traced in Coptic. Among the names of sovereigns may be specified Νίτωκρις, rendered by Eratosthenes (B.C. 230), *'Αθηνᾶ νικαφόρος.*[4] The first part of this word is the well-known Egyptian name of the goddess Νηΐθ,[5] and the second is traceable in the Coptic ϭⲣⲟ, ϫⲣⲟ, victory. In the same list of Eratosthenes we read *Φρουορῶ ἤτοι* Νεῖλος,[6] corresponding to the Coptic ⲫⲓⲁⲣⲱ, "the river," a name of the Nile.

Much stronger evidence than this from royal names for the essential identity of the sacred dialect and the Coptic is furnished by the names of common things, which are in their nature least of all liable to change. Thus Eustathius says—*ἔστι δὲ ἕρπις Αἰγυπτιστὶ ὁ οἶνος*;[7] and Tzetzes, *Αἰγύπτιοι ἕρπιν καλοῦσι τὸν οἶνον*;[8] and we find in Coptic ⲏⲣⲡ, "wine." The Egyptian for water is given as *μῶ* (*τὸ γὰρ ὕδωρ μῶ οἱ Αἰγύπτιοι καλοῦσιν*[9]) by Josephus, and as *μῶς* (*τὸ γὰρ ὕδωρ μῶς ὀνομάζουσιν Αἰγύπτιοι*)[10] by Philo Judæus, and this is identical with the Coptic ⲙⲱⲟⲩ. The word *πίρωμις*, again (*πίρωμις δέ ἐστι κατ' Ἑλλάδα γλῶσσαν καλὸς κἀγαθός*),[11] is the same as the Coptic ⲡⲓⲣⲱⲙⲓ, "the man." The word *σβῶ* (*ἡ παιδεία παρ' αὐτοῖς σβῶ καλεῖται, ὅπερ ἐστὶν ἑρμηνευθέν, πλήρης τροφή*),[12] is preserved in ⲥⲃⲱ, "erudition, discipline, knowledge," and the like. Herodotus says that crocodiles were called *χάμψαι* (*καλέονται δὲ οὐ κροκόδειλοι ἀλλὰ χάμψαι*),[13] a name which we recognise in the Coptic ⲙ̀ⲥⲁϩ, "a crocodile ;" but from others it appears that a sacred crocodile was called *σοῦχος*,[14] retained in the ⲥⲟϫⲓ of the Copts. St Jerome says of the word "achi,"—"audivi ab Ægyptiis, hoc nomine lingua eorum omne quod in palude virens nascitur appellari ;"[15] and his assertion is borne out by the significations of ⲁϫⲓ (juncus, calamus, alga, carex), and ⲁϧⲓ (pratum, virens herba, juncus, calamus).

[10] *Philo de vitâ Mosis*, tom. ii., p. 83.

[11] *Herod.* ii. 143. This rendering of the Greek historian, which has been supposed to prove his ignorance of the Egyptian language, should, we think, rather be considered as an evidence of his acquaintance with it. We find, in the famous procession of the four races, in the Tombs of the Kings at Thebes, that the Egyptians are alone called "mankind," while the other races receive their Gentile appellations, and observe that, on all their monuments, the Egyptians are represented as handsome, and called good, whereas foreigners are represented as ugly, and called wicked. It is surprising that any should have doubted that Herodotus meant that *πίρωμις* signified man, although he indicated that it signified a particular kind of man, since his translation includes the former meaning as much as does its English equivalent "a gentleman," and the context should remove any doubt that might exist.

[15] *Hieron. in Jesaiam*, lib. vii.; tom. iv., col. 291, *Vallars.* See more etymologies given by ancient writers in Parthey's *Vocab. Copt.*

The evidence derived from these etymologies and correspondences as to the essential identity of the Coptic language with the sacred, as well as with the vulgar, dialect of the ancient Egyptian, is well supported by that deduced from the names of ancient cities and nomes of Egypt. Such words as these usually remain unchanged in the course of many centuries, and we find that the Copts called a town by a name derived from that of a divinity of the religion they had abandoned, and that at this day the Muslim inhabitants still use it. If the Coptic affords a satisfactory explanation of the signification of a name which must have been given long before the Egyptian language was called Coptic, and given, necessarily, in the sacred dialect, we obtain a fresh evidence of the essential identity of what we may venture to call the two states of the language. The following examples will show the satisfactory nature of this evidence:—ⲃⲟⲩⲥⲓⲣⲓ, Busiris, ⲡⲟⲩⲥⲓⲣⲓ, ⲡⲟⲩⲥⲩⲣⲓ, a name applied to two other towns, called in Arabic, Aboo-Seer, properly Booseer, certainly meaning "the (town) of Osiris;" the first of these places is mentioned by Herodotus,[1] who visited Egypt, B.C. *cir.* 450. ⲑⲃⲁⲕⲓ ⲛ̀ⲧⲉ ⲡⲓⲁⲙⲟⲩⲛ, ⲡⲓⲁⲙⲟⲩⲛ, Thebes, or Diospolis, "the city of Amen," corresponding to the Hebrew נא אָמוֹן spoken of by the prophet Nahum,[2] B.C. *cir.* 700; ⲙⲁⲛ̀ⲑⲱⲟⲩⲧ, "the abode of Thoth;" ⲛⲁⲏⲥⲓ, "the (abode) of Isis," Anysis, mentioned by Herodotus;[3] ϫⲉⲙⲛⲟⲩϯ, Sebennytus, a name composed of that of Hercules, ϫⲉⲙ (?), and ⲛⲟⲩϯ, a god.

Characteristics of Coptic.

We may therefore safely conclude that the Coptic language is essentially the same as that of the ancient Egyptians in both its sacred and its vulgar dialect, but differing more from the former than from the latter. If then we can discover the sounds conveyed by the hieroglyphic or demotic characters, we shall have to look to the Coptic for their meaning. It will be necessary, however, as a test of the accuracy of this conclusion, to examine the Coptic in order to ascertain its characteristics, and if the conclusion be supported by this inquiry, it will acquire a still more definite form.

An analysis of a single verse of one of the Gospels will give a more distinct idea of the characteristics of the Coptic than any lengthened explanation. Ⲟⲩⲟϩ ⲁⲩⲓ̀ ⲛ̀ϫⲉ ⲛⲓⲫⲁⲣⲓⲥⲉⲟⲥ ⲛⲉⲙ ⲛⲓⲥⲁⲇⲇⲟⲩⲕⲉⲟⲥ ⲉⲩⲉⲣⲡⲓⲣⲁⲍⲓⲛ ⲙ̀ⲙⲟϥ ⲛⲁⲩϣⲓⲛⲓ ⲙ̀ⲙⲟϥ ⲉ̀ⲧⲁⲙⲱⲟⲩ ⲉ̀ⲟⲩⲙⲏⲓⲛⲓ ⲉ̀ⲃⲟⲗϧⲉⲛ ϯ̀ⲫⲉ. (Καὶ προσελθόντες οἱ Φαρισαῖοι καὶ Σαδδουκαῖοι, πειράζοντες ἐπηρώτησαν αὐτὸν σημεῖον ἐκ τοῦ οὐρανοῦ ἐπιδεῖξαι αὐτοῖς.)[4] ⲟⲩⲟϩ, "and," signifies also a "house; to be added, increased; to place to, to inhabit;" &c. ⲁⲩⲓ̀ "came" (they), 3d pl. com. past indefinite of ⲓ̀, "to go, come." ⲁⲩ is a pronominal prefix derived from ⲁ, the characteristic of the past indefinite, and ⲟⲩ, the suffixed pers. pron. 3d pl. com. "they" and "their." ⲛ̀ϫⲉ, a particle prefixed to nominatives. ⲛⲓⲫⲁⲣⲓⲥⲉⲟⲥ: ⲛⲓ, pl. com. of the article prefixed to the corrupt sing. of a Greek word, ⲫⲁⲣⲓⲥⲉⲟⲥ, for Φαρισαῖος, in order to render it plural. ⲛⲉⲙ, conj. "with," also "to" and "also." ⲛⲓⲥⲁⲇⲇⲟⲩⲕⲉⲟⲥ, as ⲛⲓⲫⲁⲣⲓⲥⲉⲟⲥ. ⲉⲩⲉⲣⲡⲓⲣⲁⲍⲓⲛ, "tempting;" comp. from ⲉⲣ, causative prefix, and ⲡⲓⲣⲁⲍⲓⲛ, "to tempt," corrupted from the Gr. πειραζειν. ⲉⲩ, pron. prefix pl. com. of the participle present. ⲙ̀ⲙⲟϥ, "him," deriv. pron. 3d sing. m. for the accusative, from prep. ⲙ̀, and ϥ suffixed pers. pron. "he, his." ⲛⲁⲩϣⲓⲛⲓ, "asked," ϣⲓⲛⲓ, "to ask"— ⲛⲁⲩ pron. prefix 3d pl. com. of imperfect. ⲙ̀ⲙⲟϥ. ⲉ̀ⲧⲁⲙⲱⲟⲩ, "to show," ⲧⲁⲙⲱⲟⲩ, "to show"— ⲉ̀ prep. employed as preformative of the infinitive. ⲉ̀ⲟⲩⲙⲏⲓⲛⲓ, "a sign— ⲉ̀ prep. employed as preformative of the accus., either separately or joined to the noun which it precedes, ⲟⲩ indef. art. com. sing. "a;" ⲙⲏⲓⲛⲓ, a "sign." ⲉ̀ⲃⲟⲗϧⲉⲛ, "from." ϯ̀ⲫⲉ "heaven"; ϯ̀ def. art. fem. sing.; ⲫⲉ, "heaven."

From this analysis we see at once that Coptic contains Greek words in barbarous forms. They are very numerous, and are particularly used to supply deficiencies in the ancient language as well as to express foreign proper names. In both cases they retain their original sound, although sometimes not exactly their original form, and are usually indeclinable except by prefixes, like the greater number of Egyptian words. We may discard these Greek words, having learned from them two things,—(1), how foreign words were introduced into the Egyptian language at a period probably commencing somewhat before the Christian Era, and terminating at, or not long after, the overthrow of paganism in the country; and (2), what words of the ancient language, that is, those referring to religion and metaphysics, we are least to expect to find preserved in the Coptic. It is also worthy of notice that some Arabic words crept into the Coptic after the Muslim conquest of Egypt.

A language may be considered as to its original forms, its derivative forms, its compound forms, its modes of expressing gender, number, relation, and time, and the relative position of its words in sentences, or roots, derivatives, compounds, inflexion, and syntax.

Roots.—It is impossible in Coptic, especially without the aid of the earlier forms of the language, to reduce all words to roots, particularly as we do not possess the entire vocabulary. The great majority of the supposed roots, however, present so remarkable an agreement that we need not hesitate in judging from their characteristics. In form they are monosyllabic, usually consisting of a vowel between two consonants, and are unchangeable except when they become derivatives. Two circumstances render it difficult to determine the original form of a root,—(1), the existence of three dialects of Coptic—the Memphitic,[5] the Sahidic or Theban, and the Bashmuric; and (2), the corruption of the language in form, resulting in the same root appearing in various forms. From these causes necessarily arises a great corruption in signification, words, the same in appearance, having different significations in the dialects, and the converse. Some examples from Peyron's *Lexicon* will explain this corruption, and the consequent confusion.

	Memphitic.	Sahidic.	Bashmuric.
A MOUTH,	ⲣⲟ, ⲣⲱ.	ⲣⲟ, ⲣⲱ.	ⲗⲁ, ⲗⲱ, ⲣⲁ.
TO DO,	ⲉⲣ, ⲓⲣⲓ, ⲣⲁ.	ⲉⲣ, ⲉⲓⲣⲉ, ⲓⲣⲉ.	ⲉⲗ, ⲉⲓⲗⲓ, ⲓⲗⲓ, ⲓⲣⲉ, ⲉⲓⲣⲉ.

---

[1] *Herod.* ii. 59. The festival of Isis of which Herodotus speaks was probably held at Iseum, which stood near Busiris, and at the site of which are remains of a magnificent temple, probably founded not long after the historian's visit (see EGYPT).

[2] *Nah.* iii. 8.

[3] *Herod.* ii., 137.

[4] *St Matt.* xvi. 1. The Coptic version is that of the very handsome edition of the Gospels, printed by Mr Watts in 1847.

[5] By Coptic, the Memphitic dialect is usually intended, except when the whole language is spoken of without distinction of dialects. In the dictionaries, the Sahidic and Bashmuric words are alone distinguished as such. It is, however, not certain that the Memphitic is the purest form of the language; for some claim this honour for the Sahidic, all agreeing that the Bashmuric is corrupt.

These instances show not only the various forms which a root may take in the different dialects, but also the care that is necessary to avoid confounding distinct roots which happen to have the same form in different dialects: they likewise show the various forms a single root may assume in one dialect, evidencing the corruption of the language in form and in signification; for a root properly has but one form, and the most marked formal changes undoubtedly originally indicated, as they still do in many instances, a change in signification. At the same time many of the lesser formal changes can only be attributed to the carelessness of the earlier Copts.

Since we must infer from the accounts of ancient writers, without assuming any knowledge of the results of Young's and Champollion's discoveries, that the hieroglyphic method of writing was partly or wholly by ideographic signs, both of real and ideal things, we must expect to find the roots in Coptic having either real, generally substantive, or ideal, generally verbal, significations.

Derivatives and Compounds.—Derivatives are formed in three ways—by a change in sound, effected by the substitution of another vowel for that of the root; by reduplication; and by agglutination, one or more consonants or vowels, originally roots, being prefixed or suffixed to the root. There are properly no compounds, for what appear to be compounds are really words composed of two or three roots agglutinated together with scarcely any, or no, change.

Inflexion.—All Coptic words are in themselves unchangeable, and their inflexion is therefore not by essential changes, but by the addition of prefixes or suffixes. The few exceptions to this rule are susceptible of satisfactory explanation. The inflexion of nouns is effected either by the definite article, or by the addition of a vowel or diphthong, or a diphthong followed by a vowel in the case of the plural number, and by the addition of a vowel in the case of the feminine gender. Forms not agreeing with this rule may yet be traced to its operation. There is no dual in Coptic. The cases are distinguished by prefixed particles, either separate or joined. The inflexion of verbs is extremely complicated, from the great number of tenses. These are generally distinguished by prefixes, terminating in enclitic pronouns, with sometimes one or two separate suffixes.

Syntax.—Notwithstanding that it has been asserted that Coptic has no syntax, we find in it peculiarities of construction and concord that can be referred to no other head. The peculiarities of construction are especially to be noticed in the exuberant use of particles; and among those of concord may be instanced the agreement of a verb sing. fem. with nouns plur. com.

From these characteristics we may draw some conclusions as to the antiquity of the Coptic language, and *the probability of its having passed through considerable changes.* The circumstance that the roots are all monosyllabic indicates an extreme antiquity and fixedness in the language, as does the manner of forming derivatives, and the virtual absence of compounds. The method of inflexion, on the other hand, though essentially in accordance with the evidences of age just mentioned, shows numerous accidental changes, as does the presence of compounds, although the latter may be so easily resolved as not to be considered part of the essence of the language. From the whole survey we must infer that the Coptic is very ancient in itself, and that the changes which it has undergone are, though numerous, for the most part of such a character as not to affect its essential characteristics; and we may, therefore, reasonably expect to find it almost exactly the same as the vulgar dialect expressed by the demotic inscription of the Rosetta Stone, and essentially the same as the sacred dialect expressed by its hieroglyphic inscription, as we had indeed already concluded on other grounds.

Statements of ancient writers respecting the Egyptian characters.

Admitting, therefore, that the language, in two dialects, which we find expressed in the Egyptian inscriptions of the Rosetta Stone, does not essentially differ from the Coptic, we have yet to discover in what manner it is expressed, whether by ideographic signs representing real things by their figures, and ideal things by symbols, in which case the Coptic would be of no use; or by signs having a phonetic value, and being either alphabetic or syllabic; or by a mixture or a combination of these two methods. It is to the statements of ancient writers that we must look for the means of solving this question.

Clemens Alexandrinus.

The celebrated passage in the *Stromata* of Clemens Alexandrinus is the most important of those which bear upon the present question. He tells us that "those who are educated among the Egyptians first of all learn the method of Egyptian writing which is called the epistolographic; and secondly, the hieratic, which the sacred scribes employ; and in the third place, and after the others, the hieroglyphic, of which one kind expresses its meaning directly by letters, and the other is ideographic. Of the ideographic kind one sort expresses its meaning by imitation, and another is written as though tropically, and another is wholly allegorical by means of certain secret signs. Thus, wishing to write sun, they make a circle, and moon, a moonlike figure, according to the kind which expresses its meaning directly. But, when they write tropically, they transfer and transpose according to relation, utterly changing some, but altering the meaning of others in many ways; thus handing down the panegyrics of the kings in theological relations, they write by anaglyphs. Of the third kind, which is by secret signs, let this be a specimen: the bodies of the other stars, because of the obliquity of their course, they represented by those of serpents, but that of the sun by that of a beetle, because [this creature] having moulded a ball-shaped thing of ox-dung, with its face towards it rolls it along,"[1] &c. Certain words and expressions in this difficult passage must not be left unnoticed, since they have been variously rendered. First of all, τὰ πρῶτα στοιχεῖα has been shown by Lepsius to mean here simply "letters," and no one can reject so apposite a rendering. Συμβολικὴ has been translated "symbolical," but this is not its primary meaning, nor does it apply in the present case. Σύμβολον is used in philosophical literature to denote a sign of something thought of in the mind, as Aristotle tells us;[1] and σύμβολικὸς means primarily "ideographic," and then "symbolic" in our use of the word. The latter we have, therefore, rendered "ideographic," and what follows entirely justifies this translation. No satisfactory explanation has been offered of the ἀναγλυφαὶ. Chevalier Bunsen's is very ingenious, but it does not seem to render the passage clearer.[2]

---

[1] *Αὐτίκα οἱ παρ' Αἰγυπτίοις παιδευόμενοι πρῶτον μὲν πάντων τὴν Αἰγυπτίων γραμμάτων μέθοδον ἐκμανθάνουσι, τὴν ἐπιστολογραφικὴν καλουμένην· δευτέραν δὲ τὴν ἱερατικήν, ᾗ χρῶνται οἱ ἱερογραμματεῖς· ὑστάτην δὲ καὶ τελευταίαν τὴν ἱερογλυφικήν· ἧς ἡ μέν ἐστι διὰ τῶν πρώτων στοιχείων κυριολογική· ἡ δὲ συμβολική. τῆς δὲ συμβολικῆς ἡ μὲν κυριολογεῖται κατὰ μίμησιν, ἡ δ' ὥσπερ τροπικῶς γράφεται, ἡ δὲ ἄντικρυς ἀλληγορεῖται κατά τινας αἰνιγμούς. ἥλιον γοῦν γράψαι βουλόμενοι κύκλον ποιοῦσι, σελήνην δὲ σχῆμα μηνοειδὲς, κατὰ τὸ κυριολογικὸν εἶδος· τροπικῶς δὲ κατ' οἰκειότητα μετάγοντες καὶ μετατιθέντες, τὰ δ' ἐξαλλάττοντες, τὰ δὲ πολλαχῶς μεταοχηματίζοντες χαράττουσιν. τοὺς γοῦν τῶν βασιλέων ἐπαίνους θεολογουμένοις μύθοις παραδιδόντες, ἀναγράφουσι διὰ τῶν ἀναγλυφῶν· τοῦ δὲ κατὰ τοὺς αἰνιγμοὺς, τρίτου εἴδους, δεῖγμα ἔστω τόδε· τὰ μὲν γὰρ τῶν ἄλλων ἄστρων, διὰ τὴν πορείαν τὴν λοξὴν, ὄφεων σώμασιν ἀπείκαζον· τὸν δὲ Ἥλιον τῷ τοῦ κανθάρου· ἐπειδὴ κυκλοτερὲς ἐκ τῆς βοείας ὄνθου σχῆμα πλασάμενος, ἀντιπρόσωπος κυλινδεῖ. Φασὶ δὲ καὶ ἑξάμηνον μὲν ὑπὸ γῆς θάτερον δὲ τοῦ ἔτους τμῆμα τὸ ζῶον τοῦτο ὑπὲρ γῆς διαιτᾶσθαι, σπερμαίνειν τε εἰς τὴν σφαῖραν καὶ γεννᾶν· καὶ θῆλυν κάνθαρον μὴ γίνεσθαι* (*Strom.*, lib. v , p. 237). The latter part of this passage is remarkably similar to parts of a chapter in the *Hieroglyphics of Horapollo Nilous*, a work for the most part containing explanations of the enigmatical sort. *Μονογενὲ, δη δηλοῦντες, ἢ γένεσιν, ἢ πατέρα, ἢ κόσμον, ἢ ἄνδρα, κανθαρὸν ζωγραφοῦσι. μονογενὲς μὲν, ὅτι αὐτογενές ἐστι τὸ ζῶον, ὑπὸ θηλείας μὴ κυοφορούμενον. μόνη γὰρ γένεσις αὐτοῦ, τοιαύτη ἐστίν. ἐπειδὰν ὁ ἄρσην βούληται παιδοποιήσασθαι, βοὸς ἀφόδευμα λαβὼν, πλάσσει σφαιροειδὲς παραπλήσιον τῷ κόσμῳ σχῆμα· ὃ ἐκ τῶν ὀπισθίων μερῶν κυλίσας ἀπὸ ἀνατολῆς εἰς δύσιν, αὐτὸς πρὸς ἀνατολὴν βλέπει, ἵνα ἀποδῷ τὸ τοῦ κόσμου σχῆμα. αὐτὸς γὰρ ἀπὸ τοῦ ἀπηλιώτου εἰς λίβα φέρεται· ὁ δὲ τῶν ἀστέρων δρόμος, ἀπὸ λιβὸς εἰς ἀπηλιώτην· ταύτην οὖν τὴν σφαῖραν κατορύξας, εἰς γῆν κατατίθεται ἐπὶ ἡμέρας εἰκοσιοκτώ. ἐν ὅσαις καὶ ἡ σελήνη ἡμεραις τὰ δώδεκα ζώδια κυκλεύει. ὑφ' ἣν ἀπομένον, ζωογονεῖται τὸ τῶν κανθάρων γένος. τῇ ἐνάτῃ δὲ καὶ εἰκοστῇ ἡμέρᾳ ἀνοίξας τὴν σφαῖραν, εἰς ὕδωρ βάλλει. ταύτην γὰρ τὴν ἡμέραν νομίζει σύνοδον εἶναι σελήνης καὶ ἡλίου, ἔτι τὲ καὶ γένεσιν κόσμου. ἧς ἀνοιγομένης ἐν τῷ ὕδατι, ζῶα ἐξέρχεται, τουτέστιν οἱ κάνθαροι. γένεσιν δὲ, διὰ τὴν προειρημένην αἰτίαν. πατέρα δὲ, ὅτι ἐκ μόνου πατρὸς τὴν γενέσιν ἔχει ὁ κάνθαρος. κόσμον δὲ, ἐπειδὴ κοσμοειδῆ τὴν γένεσιν ποιεῖται. ἄνδρα δὲ, ἐπειδὴ θηλυκὸν γένος*

The main facts stated by Clemens may be summed up as follows. The Egyptians in the second century after the Christian Era had three methods of writing—the epistolographic, the hieratic, and the hieroglyphic. The first of these methods appears from its name to have been employed for ordinary purposes, and it is therefore reasonable to suppose that it expressed the vulgar dialect. Any doubt that might exist on this matter is removed by the mention of an enchorial (or demotic) system of writing in the Greek inscription of the Rosetta Stone, and by Herodotus and Diodorus Siculus. The second method, the hieratic, is not spoken of by any other ancient writer, as far as is known. Its use by the sacred scribes leaves us no room to doubt that it must be that character in which the greater number of the papyri that have been preserved to our times are written, since it is distinct from the epistolographic on the one hand and the hieroglyphic on the other. The circumstance that the hieratic system is merely a cursive form of the hieroglyphic explains the silence which all ancient writers, except Clemens, appear to have maintained respecting it. The hieroglyphic method of writing was of two kinds, the one by letters, and the other by signs of ideas. The latter or ideographic sort, was divided into three different kinds—the first of these represented an object by a figure of it, the second was tropical, but not in an arbitrary manner, and the third was allegorical. Let us see how an actual examination of the hieroglyphics, without presupposing a knowledge of Young's and Champollion's discoveries, affects this statement. If, for example, we examine the Rosetta Stone, we cannot fail to see in the hieroglyphic inscription certain characters which bear the impress of being ideographic; indeed, at first sight, we might suppose that all the signs were of this sort, but when we come to compare this inscription with the corresponding Greek, it becomes evident that such cannot be the case, for they are too numerous, and that many of the signs must in all probability represent sounds. The two sorts of characters seem, therefore, *primâ facie*, to have been mixed. Many of the sculptures in the tombs indicate how this was done, for we find a number of animals of different kinds pourtrayed, and over each a group of a few characters terminating in a small figure of the animal represented beneath.[3] We may therefore infer that the ideographic signs were occasionally employed as determinatives following the names of the ideas they represented. The allegorical ideographs, of which Clemens speaks, seem from their nature to belong to a separate system, and an examination of the *Hieroglyphics of Horapollo Nilous* supports this view. This work, composed at a late period, and subsequently enlarged by additions, relates almost wholly to such allegorical or enigmatical characters, or uses of characters, and thus affords us a means of judging of their value. We may trace throughout the book evidences of the late origin of the system, both in its being unlike that of a primeval language, and in the marks it bears of Greek philosophy. We must, therefore, look with suspicion upon allegorical explanations of hieroglyphics which, it may be here remarked, Egyptologists have already rejected as inapplicable to those of the Egyptian monuments.[4]

Horapollo Nilous.

Porphyry.

Porphyry, in his *Life of Pythagoras*, speaks of the Egyptian methods of writing in terms which illustrate the statement of Clemens. He says that Pythagoras "in Egypt lived with the priests, and learned thoroughly the wisdom and language of the Egyptians, and the three different modes of writing, the epistolographic [letters], the hieroglyphic, and the symbolic, some conveying a direct meaning by imitation, and some expressing their meaning allegorically by certain secret signs."[5] This passage, from its singular resemblance to that of Clemens on the same subject, may be almost conjectured to have been taken from the same source, or possibly from it. It will be noticed that the hieratic is not mentioned, doubtless on account of its being but a form of the hieroglyphic method

---

αὐτοῖς οὐ γίνεται. εἰσὶ δὲ καὶ κανθάρων ἰδέαι τρεῖς. πρώτη μὲν, αἰλουρόμορφος, καὶ ἀκτινωτὴ, ἥνπερ καὶ ἡλίῳ ἀνέθεσαν διὰ τὸ σύμβολον. κ. τ. λ. (lib. i., c. x., ed. *Cory*, pp. 19-21.) [1] *Arist.* Interpr., 2. 2., 14. 14.

[2] *Egypt's Place*, vol. i., p. 340. "He (Clemens) does not say, 'in hieroglyphics'—because in them he had included the secret or enigmatical character—but 'in anaglyphs,' which, as well as the former word, originally designated engraved pictures, either serving as written characters or as ordinary portraits of objects." To this is appended the following note :—"*Ἀναγλύφω* is essentially the same as *ἐγγλύφω* : to engrave *upon* a thing, is just as correct as to grave *in* (*ingrave*) it; *ἀναγράφω, ἀναγραφαὶ* is the regular designation when mention is made of registers of the Egyptian kings."

[3] Comp. *Ælian. Var. Hist.*, x., 10.

[4] Chev. Bunsen remarks on the allegorical system :—"He (Clemens) mentions, likewise, a kind of enigmatical character, or secret writing, in which, for example, a serpent designates the planets on account of their spherical motion; but the *scarabæus*, the sun, probably because of the analogy between the round lump which it rolls before it, and the circular form of the ecliptic. Clemens calls this character the allegorical, and very properly; for the distinction between symbol and allegory is, that the former represents the intellectual object itself by a direct image; the latter conveys the idea of the object only through the medium of a logical notion. The examples in Clemens are the best proof that such a secret writing is as foreign to the sacred books as to the monuments. The serpents and scarabæi occur on the papyri as well as monuments; but the scarabæus never betokens the sun, nor the serpent the planets. The allegorical writing was an artificial one, a late application of the hieroglyphic system, originally, perhaps, for astronomical and astrological purposes, similar to our own planetary signs, and afterwards cabalistically developed. Clemens, therefore, was right in noticing this enigmatical character, in connection with the hieroglyphics; but he never could intend to represent it as a real subdivision of the ordinary hieroglyphic writing, properly so called, which is composed entirely and exclusively of the three elements he had previously enumerated —the phonetic, hieroglyphic, and symbolic signs. His object was to give an example of the manner in which this hieroglyphic character was used, as a whole, the parts of which he describes before explaining the secret character.". . . . . . "The work of Horapollo, dating from a comparatively recent age, also clearly proves the existence and nature of this secret character. While few of the explanations it offers are confirmed by the monuments, the greater part are contradicted both by them and by the Book of the Dead. The explanations themselves are little better than arbitrary subtleties, or false cabalistic mysticism, the simple and historical meaning being palpable and obvious, while the very hieroglyphical representations which he describes are chiefly borrowed from that secret character, and consequently do not apply to the monuments and books" (*Egypt's Place*, vol. i., pp. 339-342).

[5] *Καὶ ἐν Αἰγύπτῳ μὲν τοῖς ἱερεῦσι συνῆν, καὶ τὴν σοφίαν ἐξέμαθε, καὶ τὴν Αἰγυπτίων φωνὴν, γραμμάτων δὲ τρισσὰς διαφορὰς, ἐπιστολογραφικῶν τε, καὶ ἱερογλυφικῶν, καὶ συμβολικῶν. τῶν μὲν κοινολογουμένων κατὰ μίμησιν, τῶν δὲ ἀλληγορουμένων κατὰ τινας αἰνιγμούς.* (*De Vit. Pyth.*, p. 8.)

By the symbolic letters Porphyry evidently intends the allegorical mode of writing spoken of by Clemens, using *συμβολικὸς* in its secondary sense, but it may be doubted whether that mode was as ancient as the time of Pythagoras.

Herodotus and Diodorus Siculus.

Imperfect as are these notices of the Egyptian systems of writing by the late Greek writers, they are ample compared to those which we find in the works of their predecessors. Herodotus merely tells us that the Egyptians "use two kinds of written characters, of which one is called sacred and the other vulgar;"[1] and Diodorus Siculus says the same, only adding that the popular method was learnt by all, while the sacred was understood by the priests alone.[2] Herodotus mentions, in the place above referred to, that they wrote from right to left, contrary to the Greek manner, which indeed was the manner of writing that they preferred, adding, that they said that in doing so, they wrote to the right, but that the Greeks wrote to the left.[3]

The main result of our inquiry thus far is the knowledge that the ancient Egyptian language in its two forms, the sacred dialect and the vulgar, was essentially identical with the Coptic in its three dialects, and that the written characters of the former were phonetic and ideographic, signs of the two classes being sometimes employed together for the same word.

The Rosetta Stone.

Having ascertained thus much, we cannot proceed further with any degree of certainty without the aid of bilingual inscriptions in ancient Egyptian and some known language. Such records do fortunately exist. The most remarkable of them is the Rosetta Stone, a tablet bearing a decree of the Egyptian priests in honour of Ptolemy Epiphanes, issued B.C. 196. Although it has usually been called trilingual, it is properly bilingual, for it is in but two languages, Egyptian and Greek, the former being written in hieroglyphic and demotic characters. Happily, to remove any doubt as to the identity of subject of the three inscriptions, we read at the close of the Greek portion that the decree was inscribed in the characters before mentioned. "ΤΟ[ΔΕΨΗΦΙΣΜΑΤΟΥΤΟΑΝΑΓΡΑΨΑΙΕΙΣΣΤΗΛΗΝΕΚΣ]ΤΕΡΕΟΥΛΙΘΟΥΤΟΙΣΔΕΙΕΡΟΙΣΚΑΙΕΓΧΩΡΙΟΙΣΚΑΙΕΛΛΗΝΙΚΟΙΣΓΡΑΜΜΑΣΙΝΚΑΙΣΤΗΣΑΙΕΝΕΚΑΣΤΩΙΤΩΝΤΕΠΡΩΤΩΝΚΑΙΔΕΥΤΕΡΩ[ΝΚΑΙΤΡΙΤΩΝΙΕΡΩΝΠΡΟΣΤΗΙΤΟΥΑΙΩΝΟΒΙΟΥΒΑΣΙΛΕΩΣΕΙΚΟΝΙ]."[4] Great difficulties, however, beset the inquirer who thinks at first that he can read the Egyptian inscriptions of the record by the Greek. The tablet is so broken that much of the hieroglyphic version, particularly a great part of its earlier portion, is wanting, and some of the Greek has also been lost, as well as of the demotic version. The difficulty of comparing the hieroglyphic version with the Greek is thus greatly increased, and it seems more practicable to commence with the demotic. The indistinctness of the demotic characters, however, as well as their not being separated into groups, makes their study a most difficult task, and it is not to be wondered that many years had elapsed after the Rosetta Stone had been found before any real progress was made in the interpretation of its Egyptian inscriptions.

Gnostic papyrus of Leyden.

The inscriptions of the Rosetta Stone do not, however, afford the only examples known to us of bilingual records in Egyptian and Greek. Besides some tablets, there is in the Musée des Pays-Bas at Leyden, a Gnostic papyrus in demotic characters, accompanied by an interlinear transcription of certain magical words into Greek characters from the demotic words below them.[5] By carefully comparing the demotic characters of these words, when phonetic, with the Greek letters corresponding to them, an alphabet can be formed, as has indeed been done by Dr Leemans,[6] which can be used for the interpretation of the Rosetta Stone, either by being applied to the demotic version of that record, or to the hieroglyphic. In the latter case, it would be necessary to trace the demotic characters to the corresponding hieratic, and these again to the hieroglyphic, and this, notwithstanding its apparent difficulty, would be found the more satisfactory method of the two. In this manner, the Rosetta Stone might have been partly interpreted, and any one may now thus test the accuracy of the results of Young's discovery. But another method was adopted, the papyri not being known, and it depends for its defence rather upon the congruity of its results than upon its logical character. If the more accurate method, however, be tried, the results will be the same.

SECTION II.

THE METHOD OF INTERPRETING THE ANCIENT EGYPTIAN CHARACTERS EMPLOYED BY YOUNG AND CHAMPOLLION, AND THEIR FOLLOWERS.

Young's and Champollion's method.

From certain differences it has been supposed that Young and Champollion followed different methods. But since these differences are the marks of early stages of the inquiry, and since the distinctive peculiarities of the results arrived at by both these interpreters are preserved in the present theory as accepted by later scholars, it is best to consider the method to be but one.

---

[1] Γράμματα γράφουσι καὶ λογίζονται ψήφοισι, Ἕλληνες μὲν, ἀπὸ τῶν ἀριστερῶν ἐπὶ τὰ δεξιὰ φέροντες τὴν χεῖρα· Αἰγύπτιοι δὲ, ἀπὸ τῶν δεξιῶν ἐπὶ τὰ ἀριστερά· καὶ ποιεῦντες ταῦτα, αὐτοὶ μέν φασι ἐπὶ τὰ δεξιὰ ποιέειν, Ἕλληνας δὲ ἐπ' ἀριστερά· διφασίοισι δὲ γράμμασι χρέωνται· καὶ τὰ μὲν αὐτῶν, ἱρὰ· τὰ δὲ, δημοτικὰ καλέεται (ii. 36.)

[2] Διττῶν γὰρ Αἰγυπτίοις ὄντων γραμμάτων, τὰ μὲν δημώδη προσαγορευόμενα πάντας μανθάνειν, τὰ δ' ἱερὰ καλούμενα παρὰ μὲν τοῖς Αἰγυπτίοις μόνους γινώσκειν τοὺς ἱερεῖς (iii. 3). The reading διττῶν we owe to the ingenuity of Stroth (*Ægyptiaca*, ii., p. 213, note x.). "Sic ex conjectura dedi pro vulgato ἰδίων, quum et res ipsa hoc requirat, et ipse Diodorus *sup.* Lib. i. c. 81 scripserit παιδεύουσι δὲ τοὺς υἱοὺς οἱ μὲν ἱερεῖς γράμματα διττά, τά τε ἱερὰ καλούμενα καὶ τὰ κοινοτέραν ἔχοντα τὴν μάθησιν. Quæ nostro loco plane gemina sunt."

[3] Of this last observation, as far as it regards the Egyptians, Dr Brugsch offers an ingenious explanation in his *Grammaire Démotique*, supposing that the Egyptians contemplated the directions of the *strokes* of the letters, and not the sequence of the letters themselves:—"D'après notre connaissance du démotique, il est évident que cette remarque ne concerne point la direction générale de l'ecriture déjà tracée mais uniquement la manière dont on devait écrire les signes, c'est-à-dire, en les commençant du côté gauche et en les terminant à droite. . . . Il est du reste aisé de s'apercevoir au sujet des signes qui s'étendent sur le papyrus plus que les autres, que l'encre vers la droite est toujours plus faible qu'à la gauche, preuve évidente que l'écrivain a commencé par la gauche et fini par la droite" (pp. 15, 16). This explanation, however, does not seem applicable to the Greek mode of writing. The Egyptians may, however, have considered a papyrus itself as having its own right and left hand like a *person* opposite, and so have spoken of the right and left in precisely the opposite sense to that of the Greeks; an explanation which may be illustrated by our ordinary and military use of the terms in question. The meaning may perhaps be—if we suppose that the Egyptians were joking with Herodotus, and that he did not perceive it—that they considered their own mode of writing *right*, and that of the Greeks *gauche;* a rendering which is authorized by the terms employed.

[4] Tzetzes has also preserved the meaning of certain hieroglyphic ideographs according to Chæremon, an Egyptian priest and historian of the first century of the Christian Era; but he has not given us any theory of the characters, and the fragment is rather valuable as corroborative evidence, having been first noticed long after Young's discovery had been matured, than in the present place. We shall have occasion to refer to it in detail in a later part of this treatise.

[5] As there are similar papyri of the same time in Greek, it is evident that these transcribed words were either untranslatable, or were supposed to lose their power in invocations by translation, and were, therefore, thus distinguished. The following verses from the so-called "Chaldean Oracles" of Zoroaster, may be cited, as illustrating the latter of these two reasons:—

> "Ὀνόματα βάρβαρα μήποτ' ἀλλάξῃς,
> Εἰσὶ γὰρ ὀνόματα παρ' ἑκάστοις θεόσδοτα
> Δύναμιν ἐν τελεταῖς ἄῤῥητον ἔχοντα."—*Cory's Anc. Frag.*, 2d edit., p. 271.

[6] *Papyrus Egyptien Démotique à transcriptions Grecques*, ed. Leemans.

The other methods of interpreting hieroglyphics which have been proposed in modern times will not be here considered, since a full examination of them would occupy too much space in the present article, and since, if the truth of the method of Young and Champollion be proved, all other systems must necessarily fall to the ground.

The Rosetta Stone was discovered in 1799, and brought to England in 1802. In the same year the first step towards deciphering its Egyptian inscriptions was made public by the distinguished French Orientalist, Baron Silvestre de Sacy, who had discovered in the demotic inscription the groups corresponding to Alexander, Alexandria, and Ptolemy,[1] in the Greek. But he was unable to determine the force of the characters composing these groups. This was, however, done by M. Akerblad, who further discovered and resolved other proper names and words in the demotic version, but was stopped in his progress by his suppositions that the demotic system was wholly alphabetic, and that the words expressed by it were in nothing different from those of the Coptic. To M. Akerblad belongs also the merit of having discovered the numerals "first," "second," and "third," in the hieroglyphic inscription, and thus been the first to interpret correctly, on sure grounds, any part of that inscription.

The inquiry was next taken up by Dr Young, who communicated to the Society of Antiquaries, in May 1814, a "Conjectural Translation of the Egyptian Inscription of the Rosetta Stone," published in the *Archæologia*, vol. xviii. (1815). He then applied himself to the study of Coptic, and republished his translation in a revised form in the *Museum Criticum* of Cambridge, 1815. After this, in 1819, he gave the world the result of his researches in the article EGYPT, in the Supplement to the *Encyclopædia Britannica*, vol. iv. The essential part of this article, that is, so much of it as refers to the interpretation of the hieroglyphic and demotic systems of writing is here retained, for reasons which have been already stated. Some remarks are added in notes and subsequent observations, the former distinguished, for fear of mistake, by the writer's initials, to point out in what particulars subsequent discoveries have altered the views of its learned author.

DR YOUNG'S ANALYSIS OF THE TRIPLE INSCRIPTION OF ROSETTA.

Dr Young's analysis of the Rosetta Stone.

The block or pillar of black basalt, found by the French in digging up some ground at Rosetta, and now placed in the British Museum,[2] exhibits the remains of three distinct inscriptions; and the last, which is in Greek, ends with the information, that the decree which it contains was ordered to be engraved in three different characters, the sacred letters, the letters of the country, and the Greek.[3] Unfortunately a considerable part of the first inscription is wanting; the beginning of the second, and the end of the third, are also mutilated; so that we have no precise points of coincidence from which we can set out, in our attempts to decipher the unknown characters. The second inscription, which it will be safest to distinguish by the Greek name *enchorial*, signifying merely the characters *of the country*, notwithstanding its deficiencies near the beginning, is still sufficiently perfect to allow us to compare its different parts with each other, and with the Greek, by the same method which we should employ if it were entire. Thus, if we examine the parts corresponding, in their relative situation, to two passages of the Greek inscription in which *Alexander* and *Alexandria* occur, we soon recognise two well-marked groups of characters resembling each other, which we may therefore consider as representing these names; a remark which was first made by M. de Sacy, in his letter relating to this inscription. A small group of characters, occurring very often in almost every line, might be either some termination, or some very common particle; it must, therefore, be reserved till it is found in some decisive situation, after some other words have been identified, and it will then be easily shown to mean *and*. The next remarkable collection of characters is repeated twenty-nine or thirty times in the enchorial inscription; and we find nothing that occurs so often in the Greek, except the word *king*, with its compounds, which is found about thirty-seven times. A fourth assemblage of characters is found fourteen times in the enchorial inscription, agreeing sufficiently well in frequency with the name of *Ptolemy*, which occurs eleven times in the Greek, and generally in passages corresponding to those of the enchorial text in their relative situation; and, by a similar comparison, the name of *Egypt* is identified, although it occurs much more frequently in the enchorial inscription than in the Greek, which often substitutes for it country only, or omits it entirely. Having thus obtained a sufficient number of common points of subdivision, we may next proceed to write the Greek text over the enchorial, in such a manner that the passages ascertained may all coincide as nearly as possible; and it is obvious that the intermediate parts of each inscription will then stand very near to the corresponding passages of the other.[4]

In this process it will be necessary to observe that the lines of the enchorial inscription are written from right to left, as, Herodotus tells us, was the custom of the Egyptians;[5] the division of several words and phrases plainly indicating the direction in which they are to be read. It is well known that the distinct hieroglyphical inscriptions engraved on different monuments, differ in the direction of the corresponding characters. They always face the right or the left of the spectator, according as the principal personages of the tablets to which they belong are looking in the one or the other direction; where, however, there are no tablets, they almost always look towards the right; and it is easily demonstrable that they must always have been read beginning from the front and proceeding to the rear of each rank. But the Egyptians seem never to have written alternately backwards and forwards, as the most ancient Greeks occasionally did. In both cases, however, the whole of the characters thus employed were completely reversed in the two different modes of using them, as if they were seen in a glass, or printed off like the impression of a seal.[6]

By pursuing the comparison of the inscriptions thus arranged, we ultimately discover the signification of the greater part of the individual enchorial words; and the result of the investigation leads us to observe some slight differences in the form and order of some parts of the different inscriptions, which are indicated in the conjectural translation published in the *Archæologia* and in the *Museum Criticum*. The degree of evidence in favour of the supposed signification of each assemblage of characters may be most conveniently appreciated, by arranging them in a lexicographical form, according to the words of the translation, the enchorial words themselves not readily admitting a similar arrangement; but the subject is not of sufficient interest for the public to make it necessary that this little lexicon should be engraved at length.[1]

---

[1] Bunsen erroneously states these names to have been "Ptolemy, Berenice, and Alexander" (*Egypt's Place*, vol. i., p. 315).

[2] The Rosetta Stone was discovered in the year 1799, by a French officer during the repair of Fort St Julien, a little to the north of the town of Rosetta. See art. EGYPT. (R. S. P.)

[3] See preceding page.

[4] Dr Young published the three inscriptions of the Rosetta Stone thus arranged in the *Hieroglyphics* of the Egyptian Society. (R. S. P.)

[5] *Herod.* ii. 36. See preceding page. (R. S. P.)

[6] We have noticed in an earlier place exceptions to this rule. (R. S. P.)

It might naturally have been expected that the final characters of the enchorial inscription, of which the sense is thus determined with tolerable certainty, although the corresponding part of the Greek is wanting, would have immediately led us to a knowledge of the concluding phrase of the distinct hieroglyphical characters, which remains unimpaired. But the agreement between the two conclusions is by no means precise; and the difficulty can only be removed by supposing the *king* to be expressly named in the one, while he is only designated by his titles in the other.[2] With this slight variation, and with the knowledge of the singular accident, that the name of Ptolemy occurs three times in a passage of the enchorial inscription, where the Greek has it but twice, we proceed to identify this name amongst the sacred characters, in a form sufficiently conspicuous to have been recognised upon the most superficial examination of the inscriptions, if this total disagreement of the frequency of occurrence had not imposed the condition of a long and laborious investigation, as an indispensable requisite for the solution of so much of the enigma. This step, however, being made good, we obtain from it a tolerably correct scale for the comparative extent of the sacred characters, of which it now appears that almost half of the lines are entirely wanting, those that remain being also much mutilated. Such a scale may also be obtained, in a different manner, by marking, on a straight ruler, the places in which the most characteristic words, such as *god*, *king*, *priest*, and *shrine* occur, in the latter parts of the other inscriptions, at distances proportional to the actual distances from the end; and then trying to find corresponding characters among the hieroglyphics of the first inscription, by varying the obliquity of the ruler, so as to correspond to all possible lengths which that inscription can be supposed to have occupied, allowing always a certain latitude for the variations of the comparative lengths of the different phrases and expressions. By these steps it is not very difficult to assure ourselves, that a *shrine* and a *priest* are denoted by representations which must have been intended for pictures of objects denoted by them; and this appears to be the precise point of the investigation at which it becomes completely demonstrative, and promises a substantial foundation for further inferences. The other terms, *god* and *king*, are still more easily ascertained, from their situation near the name of Ptolemy.

The most material points of the three inscriptions having been thus identified, they may all be written side by side; and the sense of the respective characters may be still further investigated, by a minute comparison of the different parts with each other. The last line of the sacred characters, with the corresponding parts of the other inscriptions [which the reader will find represented under the head *Specimens of Phrases*], will serve as a fair specimen of the result which has been obtained from these operations.

In thus comparing the enchorial with the sacred characters, we find many coincidences in their forms, by far too accurate to be compatible with the supposition that the enchorial could be of a nature purely alphabetical. It is evident, for example, that the enchorial characters for a *diadem*, an *asp*, and *everliving*, are immediately borrowed from the sacred. But this coincidence cannot certainly be traced throughout the inscriptions; and it seemed natural to suppose, that alphabetical characters might be interspersed with hieroglyphics, in the same way that the astronomers and chemists of modern times have often employed arbitrary marks, as compendious expressions of the objects which were most frequently to be mentioned in their respective sciences. But no effort, however determined and persevering, had been able to discover any alphabet which could fairly be said to render the inscription, in general, at all like what was required to make its language intelligible Egyptian, although most of the proper names seemed to exhibit a tolerable agreement with the forms of letters indicated by Mr Akerblad; a coincidence, indeed, which might be found in the Chinese, or in any other character not alphabetical, if they employed words of the simplest sounds for writing compound proper names.

The question, however, respecting the nature of the enchorial character, appears to be satisfactorily decided by a comparison of various manuscripts on papyrus, still extant, with each other. Several of these, published in the great *Déscription de l'Egypte*, have always been considered as specimens of the alphabetical writing of the Egyptians, and certainly have as little appearance of being imitations of visible objects, as any of the characters of this inscription, or as the old Arabic or Syriac characters, to which they bear, at first sight, a considerable resemblance. But they are generally accompanied by tablets, or delineations of certain scenes, consisting of a few visible objects, either detached, or placed in certain intelligible relations to each other; and we may generally discover traces of some of these objects amongst the characters of the text that accompanies them. A similar correspondence between the text and the tablets is still more readily observable in other manuscripts, written in distinct hieroglyphics, slightly yet not inelegantly traced, in a hand which appears to have been denoted by the term *hieratic;* and by comparing with each other such parts of the texts of these manuscripts as stand under tablets of the same kind, we discover, upon a very minute examination, that every character of the distinct hieroglyphics has its corresponding trace in the running hand; sometimes a mere dash or line, but often perfectly distinguishable, as a coarse copy of the original delineation, and always alike when it answers to the same character. The particular passages which establish this identity extending to a series of above ten thousand characters, have been enumerated in the *Museum Criticum;* they have been copied in adjoining lines, and carefully collated with each other; and their number has been increased, by a comparison with some yet unpublished rolls of papyrus, lately brought from Egypt. A few specimens from different manuscripts will be sufficient to show the forms through which the original representation has passed, in its degradation from the *sacred* character, through the *hieratic*, into the *epistolographic*, or common running hand of the country [as will be seen under the head of *Comparison of Manuscripts*].[3]

It seems at first sight incomprehensible that this coincidence, or rather correspondence, should not be equally observable in the two inscriptions of the Rosetta Stone, which, if the enchorial character is merely a degradation of the sacred, must naturally be supposed to be as much alike as those of the different manuscripts in question; while, in reality, we can but seldom trace any very striking analogy between them. But the enchorial character, having been long used in rapid writing, and for the ordinary purposes of life, appears to have become so indistinct in its forms, that it was often necessary to add to it some epithet or synonym, serving to mark the object more distinctly; just as, in speaking Chinese, when the words are translated from written characters into a more limited number of sounds, it is often necessary, on account of the imperfection of the oral language, to add a generic word, in order to determine the signification, and to read, for example, *a goose bird*, when *a goose* only is written, in order to distinguish it from some other idea implied by a similar sound; and even in English we might sometimes be obliged to say *a yew tree*, in order to distinguish it from *a ewe sheep*, or *you yourself*, or *the letter u*. The enchorial character, therefore, though drawn from the same source, can scarcely, in this form, be called the same language with the sacred hieroglyphics, which had probably remained unaltered from the earliest ages, whilst the running hand admitted all the variations of the popular dialects [sic], and bore but a faint resemblance to its original prototype. Indeed, if it had been completely identical, there could have been no propriety in repeating the inscription with so slight a change of form.[1]

---

[1] Dr Young did somewhat towards publishing such a lexicon in the index to the translation of the Rosetta Stone given in the parallel arrangement which he printed in the *Hieroglyphics* of the Egyptian Society. (R. S. P.)

[2] This conjecture is perfectly just, the enchorial inscription giving in its last line the word SUTEN "king," instead of the PTUREMEES (Πτολεμαῖος) of the hieroglyphic inscription. (R. S. P.)

[3] In this passage Dr Young calls hieratic characters enchorial, and linear hieroglyphic, hieratic. These mistakes were natural in the early stages of the inquiry. The manuscripts, accompanied by tablets or scenes, which he mentions, are copies of all or part of the *Ritual* or *Book of the Dead*. (R. S. P.)

The rituals and hymns contained in the manuscripts which have been mentioned, are probably either of higher antiquity than the inscription of Rosetta, or had preserved a greater purity of character, as having been continually copied from older originals.[2] It is also remarkable, that in one of these rolls of papyrus, engraved by Denon, the introduction is in the sacred character, and some of the phrases contained in it may be observed to be repeated in the subsequent part of the manuscript, which is in a kind of running hand, though somewhat less degraded than in most other instances.

It was not unnatural to hope, that the comparison of these different manuscripts would have assisted us very materially in tracing back all the enchorial characters to the corresponding hieroglyphics, as far as the parts of the respective inscriptions remain entire, and even in filling up the deficiencies of the sacred characters where they are wanting; and something has certainly been gained from it with respect to the names of several of the deities; but, on account of the differences which had crept in between the forms of the language expressed by the sacred and the cursive characters, the advantage has hitherto been extremely limited. It seems, indeed, to have been a condition inseparable from the whole of this investigation, that its steps should be intricate and laborious, beyond all that could have been imagined from our previous knowledge of the subject; and that, whilst a number of speculative reasoners have persuaded themselves, at different times, that they were able to read through a hieroglyphical inscription in the most satisfactory manner, beginning at either end, as it might happen, the only monument which has afforded us any real foundations for reasoning on the subject, is more calculated to repress than to encourage our hopes of ever becoming complete masters of the ancient literature of Egypt; although it is unquestionably capable of serving as a key to much important information with respect to its history and mythology.[3] Nor is it by any means impossible, that a careful consideration of other monuments already known, or of such as are now discovered from day to day, may enable us to detect a number of unknown characters, so situated with respect to others which are already understood, as to carry with them their own interpretation, supported by a degree of evidence far exceeding mere conjecture. We are now to proceed to an enumeration of the principal characters which have been rendered intelligible.

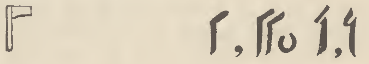
RUDIMENTS OF A HIEROGLYPHICAL VOCABULARY.

A. *Deities.*

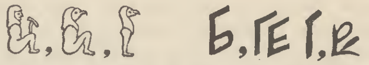
Deities.

1, 2. The word God is always represented in the inscription of Rosetta, and often in many others, by a character resembling a particular kind of hatchet, which is delineated repeatedly at Medinet-Habou as a weapon in the hands of warriors, and is even found among the modern weapons engraved by Denon. (Plate xcv.)[4]

1. GOD *Powerful.*
ⲚⲞⲨϮ



2. GOD *judge.*



This character is frequently exchanged, in parallel passages of different manuscripts, or of the same, for a figure sitting or standing without distinct arms or feet, either with a human head or a hawk's head; or sometimes, by a deviation from the correct nature of an abstract or general term, with the heads of different animals, according to the character of the deity to whom it is applied.[5] But in the inscription of Rosetta this symbol appears to be exclusively appropriated to the gods in their *judicial* capacity; and it occurs several times in the term meaning *lawful* (No. 151), [which will be afterwards explained]. This interpretation is also fully justified by the testimony of Plutarch, that "the figures of *judges* were represented without hands."[1]

---

[1] Excepting the *implied* statement that determinatives were unknown to the hieroglyphic system, though used in the hieratic, this whole paragraph, if we apply it to the true enchorial, is remarkably accurate and just, and shows far higher knowledge than one would have supposed could have been attained at the time when it was written. (R. S. P.)

[2] The *Ritual* itself had a most ancient origin, as already noticed, but there are copies of all periods, the later of which, although exhibiting changes, are yet purer in their characters than the contemporary inscriptions. (R. S. P.)

[3] Long after this Chevalier Bunsen wrote in his *Egypt's Place* (Eng. trans., vol. i., p. 267, published in 1848), "There are inscriptions, such as those on the obelisks, and whole pages in the *Book of the Dead*, which can now be read and explained, as regards their substance at least; as can also the greater part of the hieroglyphic inscription on the Rosetta Stone, by the assistance of the Greek texts [sic]. Champollion, in fact, made out the essential import of both the Egyptian texts before his visit to Egypt. Still we confidently maintain that no man living is competent to read and explain *the whole* of any one section of the *Book of the Dead*, far less one of the historical papyri." This is not strictly correct, for at the time this was written there was at least one scholar who could, now there are at least four who can, read and explain some of the short chapters of the *Book of the Dead*; yet it must be admitted, that for the most part the ancient Egyptian records in both the sacred and the vulgar characters are understood in their substance rather than in their minute details. This is seen at once from the consideration that while different scholars agree as to the general sense of any inscription, they widely differ as to its details. The alleged difficulty as to the interpretation of the historical papyri arose from neglect more than from the imperfect condition of many of them. The neglect has been in great measure repaired since the remark of Chevalier Bunsen, quoted above, was written, by the exertions of Mr Heath and M. de Rougé. (R. S. P.)

[4] The examples given as of enchorial characters by Dr Young are taken indiscriminately from the enchorial and hieratic texts, for he supposed the two to be enchorial, as already noticed. The result of this is not any positive error, for the earliest enchorial writing is scarcely distinguishable from hieratic, but it is liable to produce confusion. The later forms of demotic are to be regarded as typical of that mode of writing, the earliest are nearly identical with the typical forms of hieratic. (R. S. P.)

[5] The hatchet and the bearded human seated figure (usually distinguished by particular generic emblems, and by the length and form of the beard), are ideographic equivalents and generic determinatives of the word NETER, "a god," of which the hatchet forms the initial character with the force of N. The hawk-headed and other brute-headed figures, or the man-headed figures, with specific emblems, usually represented sitting, but sometimes standing, are the ideographic equivalents and specific determinatives of the names of different gods and goddesses. On the use of determinatives, see *infra*, section iii. (R. S. P.)

3. A Goddess is denoted by the hatchet or sitting figure, with the addition of the female characteristic, generally as a termination; but sometimes the simple character is applied to gods and goddesses indifferently.

3. GODDESS.
ϯⲛⲟⲩϯ

The semicircle and oblique oval,[2] distinguishing the feminine gender, are observable in almost all well-marked names of females found in different tablets; and the crooked line, which corresponds to them, in the enchorial character of the stone of Rosetta, may be distinguished at the end of each of the five names of females that occur in the inscription. Occasionally the characteristic is prefixed, and this position agrees better with the Coptic ᴛɪ, which distinguishes a female. Nor must we omit to observe, that a semicircle seems to answer to the ᴛ in some other cases, and is always expressed in the running hand by the character which Mr Akerblad calls ᴛ or ᴅ, and which is also exactly the Syriac ᴛ. The asp or basilisk standing erect is a symbol of divinity, which occurs on the green sarcophagus called the tomb of Alexander, and elsewhere, instead of the more ordinary character. In a few instances, the semicircle is found without the oblique oval (No. 57).

4. GODS.
ϩⲁⲛⲛⲟⲩϯ

4. The plural, Gods, is formed by repeating the character three times, or by placing three dashes after, or sometimes before it. In the enchorial inscription, the dashes are united into a crooked line, and are placed in this instance both before and after the principal character; but, in general, the second line is straighter than the first. The dual is expressed by a double character only.[3] (No. 57.)

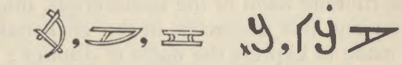
5. A winged globe, sometimes flattened as if intended for an egg, but often coloured red, is very commonly represented as hovering over a hero, and generally occupies the lintel of some of the doors of a temple.

5. *Agathodæmon.*
ⲓϧⲛⲟⲩϥⲓ ?

A globe nearly similar is also sometimes connected with the head and tail of a serpent, bearing the symbol of life, which is the common characteristic of a deity. There can, therefore, be no objection to considering these representations as belonging to the Agathodæmon, or Chnuphis of the Greek authors;[4] and the same symbol is sometimes found in the text of an inscription, in the neighbourhood of the pictorial representation. Its sense may therefore be considered as tolerably well ascertained; but the evidence being somewhat indirect, the name is inserted in smaller characters, the same distinction being also observed in other instances. Mr Bruce informs us, in his letter to Mr Wood, that in some parts of the Tunisian dominions, serpents are still regarded as a kind of good angels. The Chnubis, or Chnumis, of the amulets, is generally represented as a serpent with a human head, or with that of a lion;[5] and the former combination is not uncommon in the tablets of the manuscripts; but the hieroglyphic denoting it is a long undulated line, totally distinct from this character.

6. The symbol, often called the Hieralpha, or sacred ᴀ, corresponds, in the inscription of Rosetta, to Phthah, or Vulcan, one of the principal deities of the Egyptians.[6]

6. PHTHAH.
ⲡⲧⲁϩ



A multitude of other sculptures sufficiently prove, that the object intended to be delineated was a plough or hoe;[7] and we are informed by Eusebius, from Plato, that the Egyptian Vulcan was considered as the inventor of instruments of war and of husbandry. In many other inscriptions, the pedestal or pulley[8] is used indifferently for the plough. Horapollo tells us that Vulcan was denoted by a beetle;[9] and the Monticælian obelisk of Kircher has the plough on three sides and the beetle on the fourth. Horapollo, however, is seldom perfectly correct;[10] and the names of different divinities are frequently exchanged on the banners of the same obelisk; nor is there any clear instance of such an exchange of the plough for the beetle as occurs perpetually in the case of the pedestal. The beetle is frequently used for the name of a deity whose head either bears a beetle, or is itself in the form of a beetle;[11] and in other instances the beetle has clearly a reference to generation or reproduction, which is a sense attributed to this symbol by all antiquity; so that it may possibly sometimes have been used as a synonym for Phthah, as the father of the gods. The plough is very rarely found as the name of a personage actually represented; and it is difficult to say under what form the Egyptian Vulcan was chiefly worshipped; but on the tablet of a Horus of bad workmanship, belonging to the Borgian Museum, he is exhibited with a hawk's head, holding a spear; whilst in the great ritual of the *Déscription de l'Egypte* (Antiq. ii. pl. 72, col. 104), he seems to be represented by a figure with a human head; an exchange, however, which is very common in some other cases, with respect to these two personifications, though it does not extend to the substitution of the heads of different animals for each other.

---

[1] The passage here referred to relates to certain statues at Thebes, and therefore not *necessarily* to the general mode of representing a judge, whether by a statue or image, or by a hieroglyphic. (R. S. P.)

[2] The semicircle and egg, called by Dr Young "the semicircle and oblique oval," form a determinative of the names of goddesses, and the semicircle alone is the sign of the feminine singular. (R. S. P.)

[3] There is no dual in either dialect of the ancient Egyptian, or in the Coptic. See *infra*, section iii. (R. S. P.)

[4] The winged globe, or Her-het, is held to correspond to the Agathodæmon of the Greek writers, and the ram-headed god Num to the Chnuphis. (R. S. P.)

[5] The inscriptions of the Gnostic amulets, although they doubtless contain remains of ancient Egyptian magic, show so much foreign influence that it is best not to deduce anything from similarities we may observe in them to the old religion of Egypt. The Gnostic papyri, though more Egyptian than most of these, are yet too markedly characterized by the same foreign influence to be considered as veritably Egyptian. (R. S. P.)

[6] This is a mistake; the character in question, reading MAR and MEE, signifies to love, &c., but occurring on the Rosetta Stone in connection with the name of Ptah in the expression MEE-PTEH, "Beloved of Ptah," it was supposed, in the comparison with the Greek inscription, to be the name of that divinity. The word MAR deserves some attention, since it offers more significations than are known to belong to most other Egyptian words, and whether these be all significations of the root alone or not, they illustrate the different significations of which a root was susceptible, whether in its primitive or derivative forms. MR (we adopt this orthography since we cannot be certain that the same vowel was used in all the significations), primarily—1, to bind, envelope; 2, an island (surrounded by water); 3, a pool (surrounded by land); 4, a frontier, boundary; 5, *tropically*, to love, to kiss. (R. S. P.)

[7] The character is a hoe: for the form of it and the plough, see *Anc. Egypt.*, 2d series, vol. i., p. 40. (R. S. P.)

[8] This exchangeable character is a receptacle for water. (R. S. P.)

[9] *"Ηφαιστον δὲ γράφοντες, κάνθαρον και γύπα ζωγραφοῦσιν· Αθηνᾶν δὲ, γῦπα καὶ κάνθαρον. δοκεῖ γὰρ αὐτοῖς ὁ κόσμος συνεστάναι ἐκ τε ἀρσενικοῦ καὶ θηλυκοῦ. ἐπὶ δὲ τῆς Ἀθηνᾶς τὴν γῦπα γράφουσιν. οὗτοι γὰρ μόνοι θεῶν παρ αὐτοῖς, ἀρσενοθήλεις ὑπάρχουσι* (*Horapollo Nilous*, lib. i., cap. xii., ed. Cory, p. 29). We can scarcely suppose that the passage is corrupt, and that Horapollo really wrote, as Cory suggests, and as Dr Young seems to have also conjectured, that the Egyptians represented Ptah by a beetle, and Neith by a vulture, for the context shows that a double symbol was employed to denote the androgynous character of these divinities, and Horapollo elsewhere attributes to these signs, respectively, the significations of male and female (lib. i., cap. x., xi.). The beetle is an emblem of Ptah (Vulcan), but also and properly of the god Tar. (R. S. P.)

[10] This remark is an instance of that discriminating judgment by which Dr Young showed himself so much in advance of his predecessors, and most of his contemporaries. The character of Horapollo's work has been already noticed. (R. S. P.)

[11] Tar. See *Ancient Egyptians*, vol. vi., pl. 25, pt. 2. (R. S. P.)

7. Ammon, the Egyptian Jupiter, is sufficiently identified by a combination of evidence of various kinds, although no single link of the chain extends very far. A figure with a ram's head is denoted, both on the green sarcophagus and on the temple at Elephantiné, by a water jar, sometimes, but not always, accompanied by a bird.[1]

7. AMMON.
ⲁⲙⲟⲩⲛ

Now, a water jar of this form is constantly converted, in the running hand of the manuscripts, into a character like a *z*; and this character, in the enchorial text of Rosetta, is made to express the name of Jupiter; a fact which confirms the testimony of the Greek authors, who considered the Egyptian Jupiter as having been represented with a ram's head. A similar figure is found at Edfou (*Apollinopolis Magna*), and at Esneh (*Latopolis*). The temple at Edfou seems to have been dedicated by Amenophis or Memnon;[2] and he appears to be called "lover of Ammon,"[3] that is, Miamun, which is not unlike the name Memnon.

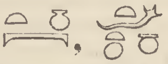
8. The common astronomical diagram for the sun, ⊙, seems to have been adopted by the Latin astrologers from their masters in Egypt; since it is not very probable that both should have employed a point in the centre of the circle without some communication with each other, the circle alone having been mentioned by some of the Greek authors, who say that it was the symbol of the sun.

8. PHRE.
ⲫⲣⲏ

The deity Re, or Phre, is indicated by this character, followed by an upright bar; and the circle is often enveloped in the coil of the body of a serpent; an oval and an arm also often follow the circle.[4] The enchorial name of the sun is extremely like that which corresponds in the manuscripts to this hieroglyphic. And a similar circle, with rays diverging from it, though seldom exactly in straight lines (No. 160), is used in the sense of "enlightening," or "rendering illustrious;" and it has also been observed by some of the French, who have been in Egypt, to stand in several inscriptions with a manifest reference to light. The circle occurs also as a part of the terms month and day[5] (No. 178, 179). In the great Hieratic Ritual, and in some other manuscripts, this name of Phre occurs very frequently under or near the tablet which contains a representation of the sun shining, as well as under the next to it, which exhibits a head rising out of a lotus,[6] an emblem mentioned by Plutarch as relating to the sun, which here is made to spring from the pedestal (No. 6), as the sun is said to have been the offspring of Phthah. Whatever plant this lotus may have been, it certainly does not much resemble the nelumbo of the East, which some imagine to have been the original emblem of fertility.[7] The name Phre is almost the only intelligible combination of letters that ever occurs on the Abraxas or amulets; and the monster to which it relates has generally radiations from its head, and is surrounded by six stars.[8] The tablets of the sun in the manuscripts exhibit also little genii worshipping him, each of which is always marked "star god."

9. The name of Rhea may, without impropriety, be assigned to a female personage very commonly accompanying the sun, and distinguished by many of his attributes; [thus]:

9. RHEA.
ϯⲫⲉ ?



although the evidence would have been somewhat more conclusive if the name had been found attached to the figure of the mother in the tablet of the birth of Isis. On the coffins of the mummies, this personage is generally represented with outstretched wings, and in other tablets without wings; but she carries in both cases a circle on her head, emblematic of the sun.[9] If we considered the analogy of the hieroglyphical name only, we should be disposed to interpret it as meaning the wife or sister of Ammon.

---

[1] This hieroglyphic name Num, here not perfectly accurately represented, since the jar should be one-handled, is that of Kneph or Chnuphis, not Ammon, whose name is written in the hieroglyphics Amen. The mistake which Dr Young here sanctions had its origin in that of the Greeks and Romans who confused the two divinities, making them to be the same as their Jupiter, and always ram-headed. Amen, however, is always man-headed. The ancient error may have arisen from the fact that the ram-headed god of the Great and Little Oases, Jupiter Ammon, was called Amen-Num, *i.e.*, Ammon-Chnuphis, or Hammon-Cenubis. (R. S. P.)

[2] The temple at Adfoo is a Ptolemaic structure dedicated to Her-het. See art. Egypt. (R. S. P.)

[3] The title Mee-Amen, signifying beloved of Amen, is given to many kings. It may have been one of those which the Greeks supposed to correspond to Memnon, which there is little reason to suppose to have been an Egyptian name. Lepsius conjectures that Memnonia, a name given to a famous temple of Rameses II. at Thebes, and another of the same king, and his father Sethee I. at Abydos, has its origin in the Egyptian Mennu, "structures," a word always used when temples are intended (*Chronologie der Ægypter*, vol. i., p. 277). (R. S. P.)

[4] The disk, or circle with a dot, is the iconographic representation of the sun, and the straight line which sometimes follows it is the sign of the masculine singular. The arm A is also occasionally added to the disk as a phonetic complement, the iconographic sign then becoming phonetic. The name of the sun and the divinity personifying it, is RA, or with the article PARA or PRA, whence the name Pharaoh, פַּרְעֹה, for the kings bore this name as representatives of the sun. (R. S. P.)

[5] As a determinative of time. (R. S. P.)

[6] The two representations here mentioned are the tablets or vignettes of the eightieth and eighty-first chapters of the *Ritual*. The title of the former is RA EN ART TARU EM NETER ERTA TEP KES ER HAR KEEKU, "The chapter of the making transformations into a god giving the hour which is to the path of darkness;" and the title of the latter RA EN ART TARU EM SESHNEE, "The chapter of the making transformations into a lotus." These relate to some of the transformations of the deceased in the other state; and the same phrase is used for birth, as M. de Rougé has shown (*Tombeau d'Ahmès*, p. 109), which seems to indicate that the Egyptians held the doctrine that man's soul returned to a human body after a certain period spent either in the other world or on the earth in the bodies of various brutes. (R. S. P.)

[7] On the lotus, see art. Egypt. (R. S. P.)

[8] See note 5, preceding page.

[9] The goddess Nutpe, here called Rhea, is the wife of Seb (Chronus), and mother of Osiris, Isis, Aroëris, Typhon, and Nephthys. She is represented on the mummy-cases as the protector of the deceased, who in taking the form of Osiris became her child. Thus the inscription of the mummy-case of Men-ku-ra (Mycerinus), the fourth king of the Fourth Dynasty (B.C. *cir.* 2300), reads thus:—"HESAR SUTEN SHEBT MEN-KU-RA ANSH TET MES EN TPE SHER NUTPE SHA [SEB ?] PESESHES MUTEK NUTPE HAREK EM RENS EN SHTE [EN] TPE ERATNES UNEK EM NE TERENSHETFUK SUTEN SHEBT MEN-KU-RA ANSH TET,"—Osiris, king of Upper and Lower Egypt, Menkura ever-living, born of Heaven, child [of] Nutpe, flesh [of Seb ?], thy mother Nutpe spreads over thee in her name of the expanse of heaven, she has granted [that] thou art as a god against thine adversaries [O !] king of Upper and Lower Egypt Menkura, ever-living" (Vyse's *Pyramids*, vol. ii., p. 94). Whether or not the name of the goddess Nutpe signifies the "abyss of heaven," in which case she would be the feminine form of Enpe (Empe), the Emeph of the

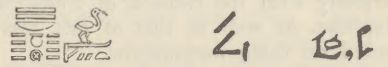
10. Ioh, the Moon, is not a deity of very frequent occurrence; but the character is easily interpreted, both from its form, and from its being found in a different position, as a part of the word month (No. 179).

10. IOH.
ⲡⲓⲟϩ

At Denderah this character is accompanied by the epithet God, and without any female termination, as well as in several passages of an epistolographic manuscript sent home by Mr Bankes; a circumstance which is favourable to the opinion that Ioh was considered as masculine in mythology[1] as well as in grammar, just as Men or Lunus was sometimes made masculine by the Greeks and Romans; the fact, however, is not absolutely decisive of this question, since the character is not accompanied by the delineation of any personification of the deity.

11. The historical description of the god Thoth, or Hermes, as the scribe or secretary of Osiris, and the inventor ot writing, sufficiently identifies him with the person who is perpetually represented standing before Osiris, and writing with a quill or a style[2] on a square or oblong tablet. He has always the head of an ibis, and this bird, standing on a perch, constitutes his hieroglyphical name, as the ibis is known to have been the emblem of Thoth. The hieroglyphic for letters (No. 103) is also frequently found among his titles; and all these circumstances abundantly confirm the opinion of his true character, which Zoega and others had already advanced from conjecture only.

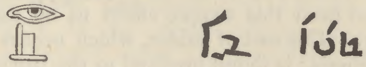
11. THOTH.
ⲑⲱꙋⲧⲑ



The enchorial name is very much disfigured, but the manuscripts exhibit a character which may serve to supply the connecting link, and another abridgment of the name which deviates still more widely from the original, being simply the common substitute for a feather, which here seems to stand for the whole bird, or perhaps merely for a feather which is often found projecting from the end of the perch. Next to Osiris, we find that Thoth is of more frequent occurrence than any other deity in the great ritual; and it is probable that the mummies of the ibis, which are so commonly found, were preserved in honour of him.[3] The semicircle with two oblique dashes, under the perch, seems to correspond to the epithet "great and great" of the Rosetta inscription; this character being generally significative of a dual.[4] The scale with eight dashes and two other characters is also very frequently employed as an epithet, and sometimes as a synonym of Thoth; it seems to mean "Dispenser of the eight treasures, or laws, of the country," for Diodorus informs us that the principal laws of Egypt were contained in eight books.[5]

12. The name of Osiris is found,[6] with the epithet "divine," in a great majority of all the mythological inscriptions that have yet been discovered; so that this circumstance alone is sufficient to show that it must have been that of the principal deity of Egypt.

12. OSIRIS.
ⲟꙋⲥⲓⲣⲓ



The enchorial character of the inscription of Rosetta is readily identified, and it agrees perfectly well with that of the manuscripts, answering to the eye and the throne; so that the manuscripts here completely supply the want of that part of the stone which contained the name in the sacred characters. This name is also universally annexed to the great figure which is found at the end of almost all the manuscripts, and on the coffins of mummies, holding a hook and a whip or fan,[7] and of which the small detached images are also extremely common. In the sculptured inscriptions, the eye generally precedes the throne; in the running hand of the manuscripts, and on the coffins of some mummies, apparently of later date, the eye sometimes follows. Plutarch had perhaps been rightly informed respecting this character; but by a mistake, which was easily committed from a want of perfect recollection, he has called it "an eye and a sceptre;" and this combination has not been recognised as the name of a deity, though a symbol something like it occurs in some of the tablets. The pictured delineation of Osiris has indifferently a human head or that of a hawk,[8] but never that of any other animal. The tear (No. 100) seems also sometimes to have been used as an emblem of Osiris, as well as of Apis and Mneuis, who were considered as representations of him. The name is found perpetually on monuments of all kinds as an epithet of a departed person; and this is one great reason of the frequency of its occurrence.

13. ARUERIS.

13. Arueris, the Apollo of the Egyptian mythology, is sufficiently identified by the comparison of various inscriptions with the fragment of Hermapion, preserved by Ammianus Marcellinus, as the translation of the inscription on a particular obelisk, with which, however, it does not exactly agree, although its style completely resembles that of the Egyptian inscriptions in general, and the beginning corresponds perfectly well to the beginning of almost all

---

so-called Hermetic Books, the second part of her name is the word "heaven"—and here Tpe, "Heaven," and "Nutpe" are the same. "The expanse of heaven" reminds us of the Hebrew רָקִיעַ, improperly translated in our authorized version "firmament" (Gen. i. 6), after the Septuagint rendering στερέωμα. "The "adversaries" or "accusers" are constantly mentioned in the *Ritual* as those against whom the deceased prayed Thoth to justify him as he had justified Osiris. (R. S. P.)

[1] The only divinity who bears the name of the moon is a form of Thoth, or Hermes, sometimes called A-AH or the Moon, at other times A-AH TET, Moon-Thoth. Shuns (Chuns) the son of Amen and Mut is also a lunar divinity. (R. S. P.)

[2] The instrument for writing here mentioned is not a style, but usually or always a reed-pen: it is possible that it may occasionally be a brush. "Of the quality of the pencils they used for drawing and painting, it is difficult to form any opinion. Those generally employed for writing were a reed or brush, many of which have been found with the tablets or inkstands belonging to the scribes; and with these, too, they probably sketched the figures in red and black upon the stone, or stucco of the walls. To put in the colour, we may suppose that brushes of some kind were used; but the minute scale on which the subjects are indicated in the sculptures prevents our deciding the question" (Wilkinson's *Ancient Egyptians*, vol. iii., p. 314). (R.S. P.)

[3] The ibis was sacred to Thoth, and therefore mummified like the other sacred animals. (R. S. P.)

[4] The name of Thoth probably reads TET; the so-called mark of duality, indicating the repetition of the alphabetic character T represented by a semicircle. There is no dual in either ancient Egyptian or Coptic, as we have already mentioned. (R. S. P.)

[5] The title of Thoth given in the woodcut is, if we exclude the first two characters, NEB SHMEN . . . "Lord of the City of Eight," Hermopolis Magna, the modern El-Ashmooneyn. (R. S. P.)

[6] The name of Osiris reads Hes-ar, which confirms the statement of Hellanicus, preserved by Plutarch, that the Egyptians pronounced it Ἥσυρις not Ὄσιρις (*De Isid. et Osir.*, cap. 34). (R. S. P.)

[7] Instead of the crook and flail of Osiris, the small figures of deceased persons in his character bear a hoe and flail, and a seed-bag. This, according to Mr Birch's explanation, is done to represent the deceased as a labourer in the Elysian Fields. (R. S. P.)

[8] Osiris is always represented with a human head, excepting in the compound character of Ptah-Seker-Hesar, in which case the head is that of a hawk. (R. S. P.)

the obelisks in existence, supposing only the hawk to be part of the name of Arueris; which is, besides, an inference extremely probable, from the tablets of several of the obelisks representing a deity characterized by a hawk with two bars,[1] and styled the son of another personage who seems to be the sun, as Apollo is called by Hermapion, and Arueris by Plutarch. Mr Hamilton has also given us a Greek inscription at Ombos, in which Arueris is made synonymous with Apollo; although the hieroglyphics which have been copied from this temple afford us no assistance in the inquiry. The sort of ladder, which occurs as a second name of Arueris,[2] is found prefixed to the hawk in its usual form, on the obelisk at Wanstead figured by Gordon, and on the frieze of Montagu and Ficoroni (*Hieroglyphics of the Egyptian Society*, 7 Eo p; 9 Lk); and it follows it on a statue of Pococke (vol. i., p. 212). Arueris is commonly represented either with a human head, or with that of a hawk, bearing a disc, as that of the sun is also generally depicted; and in plate 138 of Denon, the two deities seem in some measure confounded. The Egyptian name may be interpreted "evening sun," as emblematic of the repose of victory —ER RUHI RE.

14. ISIS, the sister and wife of Osiris, is very naturally denoted by the throne with the female termination [thus]:

14. ISIS.
ⲎⲤⲒ, ⲐⲈⲤⲒ ?

and, in more than one instance, the female figures, which have been long recognised as representations of Isis by other attributes, are distinguished by bearing the throne on the head, which is a common mode of characterizing the different personages of the tablets.[3] The manuscripts, again, enable us to discover the connecting link between the sacred and enchorial characters, and to supply the defects of the stone of Rosetta; though the resemblance is somewhat too imperfect to have satisfied us without their assistance. The goddess, thus distinguished, is very generally represented as standing at the head or feet of a corpse, with another female figure opposite to her; and we find the same personages at the opposite ends of several of the sarcophagi;[4] so that the analogy of Isis to Proserpine, and her character as the guardian of the remains of the dead, are sufficiently consistent with these representations. On a scarabæus brought from Egypt by Mr Legh, and in a hieroglyphic inscription at Philæ, she appears to be called the offspring of Phthah.[5] She often bears in her hand a sceptre forked at the foot, with a lotus for its head, while Osiris has more commonly a similar sceptre with the head of an animal; but these attributes are sometimes assigned to other deities.[6] In one of the boats on the green sarcophagus, and on Letheuillier's mummy, both in the British Museum, she is personified as a basilisk. Mr Hamilton has published some Greek inscriptions from Philæ, and from the small temple at Dendera, which show that Isis was the principal deity of these temples; and the hieroglyphics, as far as they have been copied, are precisely of the same import. The great temple at Karnak seems also to have been dedicated to Isis, and probably the small southern temple.[7] On a medal of Greek workmanship in the Borgian Museum, we have a figure of Isis, with the word THĒSI,[8] which may probably have been intended for TIESI, the Egyptian name with the feminine article.

15. The constant companion of Isis can be no other than NEPHTHE.[9]

15. NEPHTHE.

Her name somewhat resembles that of Isis, with a scale or basin annexed to it, but the square surrounding the throne is completed, and the scale is sometimes detached from it, with a [semi] circle interposed; and, in this form, the name comprehends one of the characters denoting a temple[10] (No. 87). It seems also to be a head of Nephthe that is found at Dendera and elsewhere, supporting a little temple or shrine, in the place of the capital of a column; nor is it improbable that the temple at Dendera was dedicated to Nephthe, for the Greek inscription has Aphrodite, which is mentioned by Plutarch as a synonym of Nephthe.[11] It is true that the birth of Isis is represented on one of the ceilings, but it does not therefore follow that Isis was the principal goddess of the temple. A head bearing a shrine is not an uncommon ornament of a sistrum; and this agrees perfectly with the remark of Plutarch, that the head of Nephthe, as well as that of Isis, was sometimes represented on these instruments.

16. BUTO.

16. The emblem of a bird in a cage, which is often found in the manuscripts, accompanied by the figure of a child, seems to indicate the character of a *nurse*, and may without inconvenience be interpreted as relating to the goddess *Buto*, the nurse of Horus and Bubastis; though it would perhaps have been more correct to engrave the name in smaller letters, as denoting some degree of uncertainty.[12] On the sarcophagus called the Lover's Fountain, in the British Museum, she is delineated with a hawk's head; in the western temple at Philæ she has a human head with a horned head-dress, and she sits near Isis and Horus, a circumstance which strongly confirms the propriety of the denomination.

17. The enchorial name of HORUS seems to be derived from the figure of a hawk followed by the character de-

---

[1] These hieroglyphics form a name of Ra. (R. S. P.)

[2] The character here called a ladder is the second hieroglyphic of the second name in the wood-cut above. The name reads Atum, and is applied to a deity of Hades. (R. S. P.)

[3] The name of Isis reads HES. (R. S. P.)

[4] The female divinities who are thus represented as mourners, are Isis and her sister Nephthys. (R. S. P.)

[5] This is a mistake. Isis is a child of Seb. (R. S. P.)

[6] The gods usually carry the sceptre with an uncertain animal's head; the goddesses, that with a lotus. (R. S. P.)

[7] The great temple at El-Karnak was dedicated to the Theban triad, Amen-ra, Mut, and Chuns; and the principal temple to the south of that great edifice, to Chuns. The latter appears to be the one here called "the small southern temple." (R. S. P.)

[8] Inscriptions of this kind on coins are frequently tooled, having been added by the cinque-cento forgers; and the one here mentioned is probably such, although it is of course impossible to pronounce on this matter without an inspection of the coin itself. (R. S. P.)

[9] The proper orthography of this name is Nephthys. (R. S. P.)

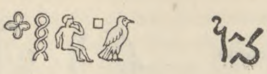
[10] This name reads NEBT-EE or NEFT-EE, "the lady of the house;" the latter reading is based on the supposition that Dr Hincks is right in making the complementary letter of the first sign sometimes F and not B. (R. S. P.)

[11] Νέφθυν, ἣν καὶ Τελευτὴν καὶ Ἀφροδίτην, ἔνιοι δὲ καὶ Νίκην ὀνομάζουσιν (*De Isid. et Osir.*, cap. 12). The Egyptian Venus was, however, Athor, not Nephthys, and it is to the former goddess that the famous temple at Dendera was dedicated, and it is her head which adorns the capitals of its columns. (R. S. P.)

[12] The hieroglyphic name here given is that of Athor, and may be read TEE-HER or perhaps EET-HER, the abode of Horus, an explanation entirely in accordance with Plutarch's, for he says that Ἄθυρι signifies οἶκος Ὥρου κόσμιος (*De Isid. et Osir.*, cap. 56). In this passage Plutarch makes Αθυρι to be but a name of Isis, and it must be admitted that the two goddesses are closely connected. (R. S. P.)

noting Isis; an arrangement which agrees very well with the supposition that his usual denomination was Horsiesi.[1]

17. HORUS.
ϩⲱⲣⲥⲓⲏⲥⲓ?



The figure of the infant (No. 133), the chain, and the knot, clearly form a part of the name on a Horus engraved by Montfaucon (*Ant. Expl.*, tom. ii., p. 302), and on an obelisk from Bosc in the Supplement of the same work. In some cases a feather, following the infant, seems to supply the place of the bird, as in Caylus (*Recueil*, tom. iv., pl. 13).

18. PAAMYLES.

18. Paamyles, mentioned by several authors as the Priapus of Egypt, is sufficiently distinguishable by his usual attributes. He is often figured with one hand only, which is elevated towards the angle of a kind of whip or fan suspended above him. At Edfou he is once denoted in an inscription by a figure like that of the tablets; and in another place by a distinct name,[2] much resembling that of a female deity, found on some of the cases of the mummies, and who might consequently be called *Paamylia*.

19. NILUS.
ⲫⲓⲁⲣⲟ

19. The Nile seems to have been reckoned among the deities of Egypt, and the character which appears to be appropriate to a river (No. 82) is found occasionally in the tablets, followed by a vessel and a spiral (Nos. 7 or 9, and 201), which seem, indeed, to make a part of the name, and accompanied by epithets of respect. This character has already been considered by Kircher and others as representing a nilometer; and the deity in question can only be distinguished by the name Nilus.[3]

20. The sacred characters denoting Apis are pretty clearly determined by the triple inscription; the enchorial name is perfectly so.[4]

20. APIS.

If, however, any doubt remained on the subject, it would be removed by an examination of the inscriptions on four vases found by Paul Lucas (*Voyage dans la Turquie*, vol. i., p. 346, Amsterdam, 1720, in 2 vols. 12mo), at Abousir, the Busiris of the ancients; that is, the Be Oshiri,[5] or sepulchre of Osiris, as Diodorus very properly translates it. There is a received tradition that Apis was worshipped and buried here, and Lucas established its truth by finding the mummy of a bullock in the catacombs.[6] Now, all the inscriptions on the vases end with a bullock preceded by this character, though the angles are turned in a different direction from those of the inscription of Rosetta; so that the two forms of the character seem to have been used indifferently. With this latitude, we have no difficulty in identifying the name, as it occurs in almost every line of the inscriptions on the great sarcophagus of granite formerly at Cairo, called the Lover's Fountain, and now in the British Museum; which there is some reason to suppose, from the frequency of this name, may have been intended for receiving a mummy of the bull Apis; although it must be confessed, that in several other monuments the names of the deities are introduced in a manner somewhat similar, with an evident relation to the designation of some human being whom they are intended to commemorate.[7]

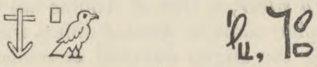
21. MNEUIS.

21. The enchorial name of Mneuis is very completely ascertained by the inscription of Rosetta, and from a comparison of different passages in the manuscripts there is reason to infer that it was intended as an imperfect representation of a basilisk and a tear,[8] emblems which are repeatedly found in the great ritual, connected with the figure of a bullock.

21*. Damalis.

21*. The sacred cow, in the manuscripts sent home by Mr Bankes, is denoted by a serpentine line with two dots, followed by the term goddess. We may venture to distinguish her by the temporary name *Damalis*. That of Io would imply too great identity with the Greek mythology.[9]

22. Hyperion.



23. Cteristes.

22, 23. In the tablets representing the judgment of the deceased we generally find two personages standing by the balance, and apparently weighing his merits; one with the head of a hawk, the other with that of a wolf,[10] and seeming to officiate as the good and evil genius of the person. The former, denoted by a hawk with a bar, and sometimes also a spear, appears, from various monuments, to have some relation to the Sun or to Horus, and may therefore be called *Hyperion;* the other is often observed to be employed in the preparation of a mummy, and may be called from this occupation *Cteristes*, or the embalmer. He is also frequently represented on the coffins of mummies and elsewhere under the form of a wolf sitting on a kind of altar; and he seems to be an immediate minister of Osiris. His hieroglyphical name is a feather, a wavy line, and a block;[1] or a hatchet under a sort of arch.

---

[1] Horus the Younger is frequently termed HER-SA-HES, "Horus, son of Isis," to distinguish him from Aroëris, HER-UR, "Horus the Elder," and Harpocrates, HER-PA-SHRUT (CHRUT), "Horus the Child." The hieroglyphic name given in the text is that of Harpocrates, the enchorial that of Horus simply, meaning Horus the Younger, for the simple name Horus applies to this divinity. (R. S. P.)

[2] The Egyptian name of this divinity, a bolt on a stand, is usually read Khem, but its sound cannot be considered certain. At Thebes he was worshipped as Amen-ra-Khem, or Amen-ra-ka-mut-f, the latter name first rightly read by Mr Birch as "Amen-ra, who is male and female." The hieroglyphics given in the text have nothing to do with Khem. (R. S. P.)

[3] The hieroglyphic character does not represent a nilometer but an adze: its proper signification when employed as an ideograph is "approved," or something very similar, as in the prenomen of Rameses II. The group spoken of by Dr Young in the text, with a character which he does not mention, the wavy line, preceding the adze and with the vase and chicken, the homophone of the spiral, with the determinatives of time and heat or fire, also not mentioned, following it, is rendered by Dr Brugsch "the hot season" (*Récherches Nouvelles*, p. 62, pl. iv., no. 13, b., c.). (R. S. P.)

[4] This name, reading HAPEE, is that of the sacred bull Apis, of one of the four genii of Amenti (Hades) whose names occur on the so-called Canopic vases, and it is also the commencement of the name of Nilus, usually read HAPEE-MU. (R. S. P.)

[5] The proper etymology of the name of Busiris is doubtless PA-HESAR, "the [tomb] of Osiris." (R. S. P.)

[6] It is not far from this Busiris that the sepulchre of the bulls Apis has been discovered by M. Mariette. Art. Egypt.

[7] The word here mentioned is that of the person for whom this sarcophagus was made, HAPEE-MEN, "Apis the Established." The bulls Apis were buried in sarcophagi of much larger dimensions than this. (R. S. P.)

[8] The hieroglyphic characters do not compose the name of Mnevis. (R. S. P.)

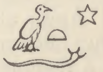
[9] It is very probable that Io is connected with Egyptian mythology. The name Io may be traced in AAH, the moon, or in AH, a cow, more probably in the latter. (R. S. P.)

[10] Horus and Anubis. (R. S. P.)

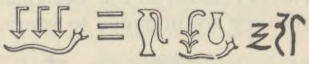
24. Tetrarcha.

25. ANUBIS.

26. MACEDO.

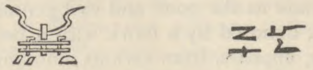


27. Hieracion.



24–27. Under the bier on which a mummy lies, and in many other situations near the person of the deceased, we find representations of four deities who seem to be concerned in the operation of embalming, and who might even be supposed to preside over the different condiments employed, their heads frequently serving as covers for four jars, of the kind sometimes called Canopi.[2] They may also very properly be considered as attendants of Isis, who seems to be a still more important personage on such occasions. The first of the four has generally a human head, and may be called *Tetrarcha;* his name contains a sort of forceps, and a broken line.[3] The second and third have respectively the heads of a dog or baboon, and of a wolf;[4] and they agree very satisfactorily with the well-known character of ANUBIS, and with that of MACEDO, his companion, mentioned by Diodorus as having a wolf's head, [and] whose name may possibly have some relation to MANCHAT, *a worker in silver*, as that of Anubis has to NUB, *gold*.[5] The hieroglyphic name of Anubis differs from that of Apis only in having the angles directed immediately upwards, a circumstance which is not so indifferent to the signification as it at first appeared;[6] that of Macedo has a vulture with a star, and sometimes an arm instead of the vulture. The fourth of these deities is represented with the head of a hawk, and may therefore be called *Hieracion*, and he is denoted by a water jar, with three plants somewhat resembling leeks or onions.[7]

28. Cerexochus.



29. Bioxiphus.

30. Platypterus.

31. Mastigias.

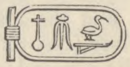
32. Soraea.

28–32. Amongst the many hundreds of deities who are represented in various inscriptions and sculptures, some of the most remarkable are two personages with the heads of wolves, the first characterized by a sort of raised frame or banner, and a pair of horns, which may be expressed by the pseudonymous or temporary term *Cerexochus*,[8] and the second by a half bow and a sword or knife, whence he may be called *Bioxiphus;* a figure with a human head, generally wearing a feather on it, and denoted by a broad feather reversed, which is implied in the name *Platypterus;* another wearing a cap with a whip in it, who may be called *Mastigias;* and a fifth in the form of a female, distinguished by a bier, who, at Edfou, bears a tear on her head, and who may be called *Soraea*.

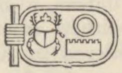
B. *Kings.*

Kings.

33. Thuthmosis.



34. Mesphres.



33, 34. We are informed by Pliny that the Alexandrian obelisk was erected by Mesphres or Mestires, the reading of the different manuscripts being different;[9] and since no king of the name Mestires is mentioned by other authors, we may consider this *Mesphres* as the Mesphres or Mesphris who succeeded his mother Amersis about 1700 B.C., or perhaps a century or two later.[10] The hieroglyphical name of his father contains that of the god Thoth, and may therefore possibly have been intended for the *Thuthmosis* of the chronologers, who is said to have been the grandfather of Mesphres.[11] The obelisk at Alexandria, now called

---

[1] This is the hieroglyphic name of Anubis, the characters composing which are the reed (A), the wavy line (N), and the mat (P), as in the woodcut: to these is sometimes added the chicken, to express the medial vowel (U). The name reads ANUP. The head of Anubis is that of a jackal. (R. S. P.)

[2] These are the four genii of Amenti, children of Osiris, who presided over the parts of the body which were removed in the process of embalmment, and placed in the jars of which the lids had the forms of their heads. (R. S. P.)

[3] The name of this first genius is AMSET. (R. S. P.)

[4] The heads of the two genii here mentioned, HAPEE and SU-MUTF, are respectively those of a cynocephalus and a jackal, not "of a dog or baboon, and of a wolf." (R. S. P.)

[5] The name of Anubis has nothing to do with that of gold, which is a distinct root. (R. S. P.)

[6] This is the same as the name of Apis, as already mentioned. (R. S. P.)

[7] This name probably reads KABHSNUF. (R. S. P.)

[8] This divinity is HEP-HERU, "the guardian of the paths" [of the sun]. Like Anubis, he is jackal-headed, and is sometimes represented by a jackal alone, as on the top of the funereal tablets, where Anubis and he are thus represented.

[9] The Egyptian names in Pliny are so corrupt that it is frequently impossible to trace their original forms. "Trabes ex eo [syenite] fecere reges quodam certamine, *obeliscos* vocantes, Solis numini sacratos. Radiorum ejus argumentum in effigie est; ita significatur nomine Ægyptio. Primus omnium id instituit Mesphrês [*var.* Mespheres], qui regnabat in Solis urbe, somnio jussus; hoc ipsum inscriptum in eo; et-enim sculpturæ illæ effigiesque quas videmus Ægyptiæ sunt litteræ. Postea et alii excidere reges. Statuit eos in supra dicta urbe Sesothes [*var.* Sothis] quattuor numero, quadragenum octonum cubitorum longitudine: Rhamsesis autem, quo regnante Ilium captum est, cxxxx (*var.* quadraginta) cubitorum (*Hist. Nat.*, lib. xxxvi., cap. viii., § 14, ed. Sillig). Comp. *Herod.* ii., cap. 111, on the two obelisks set up by Pherôn, the son of Sesôstris, at the temple of Heliopolis, in gratitude for the recovery of his sight, and *Diod.* i., cap. 59, where the story told by Herodotus is related of Sesoôsis II., who corresponds to the Pherôn of the older historian. (R. S. P.)

[10] The name here read Mesphrês is the prenomen of Thothmes III., who is not the Mesphrês of Manetho, but the Misphragmuthôsis (Mesphrês-Tethmôsis?) Its sound is probably MEN-TAR-RA, or MEN-TA-RA. Mesphrês is the fifth king of Manetho's Eighteenth Dynasty, and Misphragmuthôsis the sixth, respectively the Thothmes II. and Thothmes III. of the monuments, and their chronological period is about the middle of the fifteenth century before the Christian Era. (R. S. P.)

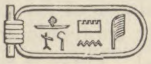
[11] Dr Young always supposes the second name of a king—perhaps because the phrase "son of the sun" intervenes between it and the first—to be the name of his father. The title "son of the sun" is, however, applied to the second name as a prefixed title, not as a title

Cleopatra's Needle, like almost all others which contain three lines on each side, exhibits different names in the middle and the outer lines. From this circumstance, as well as from the greater depth of the sculptures, which is generally observable in the middle line, there is reason to suppose that this line stood at first alone, and that the two on each side were added by a later monarch.[1] The Lateran obelisk, however, is remarkable for exhibiting the name of Mesphres on all the lines of the different sides.[2] The Constantinopolitan obelisk has only one line on each side, with the name of Mesphres, the son of Thuthmosis.[3] The same name is also found on the gateway of the fifth catacomb at Biban-el-Molouk,[4] on a pillar of the palace at Karnak, and in a splendidly-coloured bas-relief on one of the interior architraves of the gallery; as well as on a seal of Denon, pl. 98, and on some others brought from Egypt by Mr Legh.

35. Misphragmuthosis.

35. The Isean obelisk of Kircher has a "son of Mesphres, favoured by Phthah;" we must therefore distinguish this king by the name *Misphragmuthosis*, who is recorded as the son and successor of Mesphres.[5]

36. Tithous.



37. Eoa.

38. MEMNON.
ⲁⲙⲉⲛⲱⲫ

36–38. A multitude of ancient Greek inscriptions identify the statue of Memnon, celebrated by all antiquity for its musical powers, which Strabo says he witnessed in person though he could not very positively decide that the sound proceeded from the statue rather than from some of the bystanders. In one of the inscriptions we find the word *Phamenoth*,[6] not as a date, but as a synonym of Memnon, which must be considered as identical with the Phamenoph given by Pausanias as his Egyptian name,[7] and with the Ammenoph or Amenophis of Manetho or others, which differs from it only as wanting the article. There is, however, some doubt to which Amenophis this statue properly belongs.[8] Manetho makes Memnon the eighth king of the Eighteenth Dynasty, who may be called Amenophis the Second;[9] but Marsham brings him down to the Ammenephthes of Manetho, or Amenophis the Fourth, and principally because he thinks that only a successor of Sesostris could have been well known in Asia; and he even supposes him to have been later than Homer, who, he says, never mentions him, though Hesiod calls him the son of Tithonus and Aurora. But, in fact, the name of Memnon does occur in the *Odyssey*, where Ulysses alludes to his beauty in a conversation with the shade of Achilles; and Hesiod could scarcely have mentioned a king as descended from a deity that was not considerably earlier than his own time; so that the tradition of Manetho seems to be preferable to the mere conjecture of Marsham. At the same time, we cannot well call him Memnon, the son of Thuthmosis, the name of the father not agreeing with that of this king; and there is another circumstance which seems to lead us to the third Amenophis, intermediate between these two extremes, who was the son of Ramesses Meiamun, or Ramesses, the lover of Ammon;[10] which is that Amenophis himself appears to have built a temple to Ammon in the isle of Elephantiné, and is called Meiamun in several of the hieroglyphical inscriptions still existing there. So that there is little doubt that the name Memnon must have been derived from Meiamun.[11] Besides the different statues of the Memnonium, we find monuments of the same personage in almost every part of Egypt, though they are much more frequent at Thebes and in its neighbourhood. The name is marked on all the lion-headed goddesses of black granite which are now in the British Museum, and on some others which are in possession of Mr Bankes. The first of this series having been purchased, as Bruce informs us, for a large price, by Donati, for the king of Sardinia, the inhabitants were induced to take some pains in digging the others out of the sand. The building called by the French the tomb of Osymandyas bears also the name of Memnon;[12] and it is

---

connecting the two names. The first name is now called the prenomen, the second the nomen. Thus in the present case the nomen Tet-mes or Thoth-mes, "born of Thoth (Hermes)," follows the prenomen Men-tar-ra. The earliest kings have no prenomens. (R. S. P.)

[1] The standing and fallen obelisks at Alexandria have in their centre lines the name of Thothmes III., and in their lateral lines that of Rameses II., while that of a later king appears in small additional inscriptions exterior to the others and near the base. (R. S. P.)

[2] This obelisk is the largest known, being upwards of 105 feet in height, and having been originally upwards of 108, exclusive of course of the modern pedestal and ornaments. It bears the name of Thothmes III. (R. S. P.)

[3] The obelisk in the Hippodrome at Constantinople bears the name of Thothmes III. (R. S. P.)

[4] This is a mistake, the oldest tomb and name in the two valleys of kings' sepulchres at Thebes being those of Amenoph III., son of the fourth and last Thothmes, unless indeed the unplaced king Skha-ee or A-ee be of an earlier period. (R. S. P.)

[5] In Manetho's list Misphragmuthôsis is the successor of Mesphrês, and in Josephus' version, his son. The royal name given by Dr Young is not, however, that of this sovereign, but a blundered imitation of another name. (R. S. P.)

[6] The inscriptions give Αμενωθ, and Φαμενωφ (*Mod. Egypt and Thebes*, vol. ii., p. 162). (R. S. P.)

[7] Ἀλλὰ γὰρ οὐ Μέμνονα οἱ Θηβαῖοι λέγουσι, Φαμένωφα δὲ εἶναι τῶν ἐγχωρίων, οὗ τοῦτο ἄγαλμα ἦν. ἤκουσα δὲ ἤδη καὶ Σέσωστριν Φαμένων εἶναι τοῦτο τὸ ἄγαλμα, ὁ Καμβύσης διέκοψε (*Paus. Att.* i., 42). Comp. the *Paschal Chronicle*—Ὁ δὲ αὐτὸς (Καμβύσης) καὶ τὸν Ἀμμενῶφιν, ὃς Μέμνων νομιζόμενος εἶναι καὶ λίθος φθεγγόμενος, τέμνει, ὑφορώμενος γοητείαν τινὰ εἶναι ἐν αὐτῷ, ὡς ἱστορεῖ Πολύαινος Ἀθηναῖος (*Chron. Pasch.* i., p. 270, ed. Dind.).

[8] The name is that of Amenoph III., whom the two colossi, the Vocal Memnon and the corresponding one, represent. He is called Amenôphis by Manetho, and is the eighth sovereign of his Eighteenth Dynasty. (R. S. P.)

[9] Manetho omits the second Amenoph, and the third is therefore the second in his list. (R. S. P.)

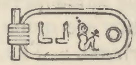
[10] Amenoph III. is here misplaced. He was son of Thothmes IV., and reigned long before the first Rameses. The Rameses Miammous, properly Miammun, of Manetho, is Rameses II., grandson of the former king of the same name. (R. S. P.)

[11] Few would now propose to find an etymology of Memnon in Egyptian. The whole story of Memnon is one distinct from Egyptian history. He was an Asiatic if a really historical personage, and his name is probably either Greek or Assyrian. The Greeks after the time of Herodotus, and still more the Latins, took little care to distinguish between the Eastern and the Western Ethiopians: it was enough that Memnon was an Ethiopian for them to seek for traditions of him in Egypt, and the Egyptian priests, with a readiness that has made them in more cases than one causes of confusion in history, told their inquisitive Greek visitors that the half-Ethiopian Amenoph was the Memnon of the Trojan War. But after a time, either through the carelessness of the priests or the hasty conjectures of the Greeks and Romans, every king who had a name or title resembling Memnon was confounded with him, and the edifices which he raised called Memnonia. Of the latter appellation we have noticed Dr Lepsius' ingenious, though we cannot but think improbable, explanation.

[12] This temple is the Rameseum of El-Kurneh, or palace-temple of Rameses II., in Western Thebes. This king was called Mee-amen Rameses, a name which in this case was corrupted into Memnon. (R. S. P.)

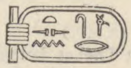
remarked by Strabo, that Memnon and Ismendes may probably have been the same person. The name is also found in the grottos at Biban-el-Molouk,[1] on some statues representing Osiris, and in some inscriptions at Ombos, as well as on a seal of Denon (pl. xcviii.) Mr Bullock has presented to the British Museum a scarabæus of very hard stone, on which we find the name of Memnon, together with that of his father and mother, whom we may call, in order to preserve the mythological analogy, *Tithous* and *Eoa*, although without asserting that this Tithous was the builder of the Labyrinth, which some authors have attributed to a king named Tithoes, and others to Ismendes.[2] The mother's name occurs also alone, as "the goddess mother," on the back of a beetle in Gordon's *Mummies* (plate xxii.), a circumstance which removes the doubt that might otherwise arise from the want of the female termination in the name; the father's is found on a square seal in the possession of Mr Legh. There is another copy of the inscription of Mr Bullock's scarabæus, on a scarabæus belonging to Mr Palin, which had long been used by a Greek priest at Athens for stamping the paschal bread (Dubois, *Pierres Gravées*, Paris, 1817, pl. v., n. 5). The beautiful head lately brought from the Memnonium to the British Museum has only a part of the father's name remaining, which does not appear to be that of the father of Memnon, though the first three characters are the same; but the fourth is the pedestal representing Phthah; and a similar name is found on some other colossal statues and obelisks remaining in Egypt, as well as on a smaller figure of red granite brought by Mr Hamilton from Elephantiné.

39. Amenses.



39. In the principal name on the obelisk at Karnak, the final scale of the name of Memnon is exchanged for a pair of arms stretched upwards; a variation which may be expressed by calling it Amenuses or *Amenses*, from SHESH, a pair.[3] The father's name is also a little like that of Tithous; but that the difference is constant may be inferred from its separate occurrence on a seal brought home by Mr Legh, a lion's head making a part of it in both instances. The true name and date of this personage must be considered as wholly unknown, though the resemblance of the name to Memnon makes it convenient to place them together. In Mr Boughton's minute golden image, engraved in the *Archæologia*, the name appears to be the same, but with the synonymous substitution of the hatchet for the judge.

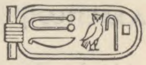
40. Heron.



41. Remesses.

40, 41. The obelisk at Heliopolis has every mark of considerable antiquity, and the shortness and simplicity of its inscription is appropriate to a remote period. Pliny says that Mitres or Mestires first erected obelisks at Heliopolis; he also mentions Sothis, and apparently Ramesses, as having left similar monuments of their magnificence in the same place. The principal name upon the obelisk now remaining at Matareah may also be observed in several other inscriptions, but with the substitution of two other names for that of the father, so that the name of the son must probably have belonged to many different individuals; a circumstance which, as well as the sounds belonging to the different characters, agrees very well with Ramesses; for we have RE, *the sun*, MES, *a birth*, and SHESH, *a pair*, so that we may venture to call it *Remesses;* and we may take *Heron* for the father of the first Remesses, from Hermapion, though it is possible that he may be the Armais of Manetho; but we have scarcely sufficient evidence to appropriate to him that name.[4] Another Remesses seems to have been a son of Sesostris; a third Ramesses follows Ammenephthes in Manetho, and agrees with the Rhampsinitus of Herodotus, and the Remphis of Diodorus, who is mentioned as the successor of Proteus; and this may, perhaps, have been the Remesses of the friezes of Montagu and Ficoroni (*Hieroglyphics*, 7 Ou. 9 If.), who seems, from the resemblance of the different parts of the work, to have been nearly contemporary with Sesostris.[5] (*Hieroglyphics*, 7 H. I.) There is also another Remesses on the Lions at the fountain of Aqua Felice, near the baths of Diocletian at Rome, the name of whose father is a little like the name supposed to belong to Arsinoë (No. 60).

42. Sesostris.



43. Pheron.

42, 43. The obelisk erected by Augustus in the Campus Martius is said by Pliny to have been the work of Sesostris;[6] and there are sufficient documents of its identity with that which had long remained buried near the Monte Citorio, and of which figures have been given by Zoega and others. The inscription was supposed, in the time of Pliny, to contain a compendium of the physical and philosophical learning of the Egyptians; but, in order to make this opinion credible, it would be necessary to admit that the princes of earlier days entertained very different ideas from those which have since been prevalent respecting the comparative importance of the abstract sciences, and of national prosperity and martial glory. If Sesostris was the son of Amenophis, he cannot have been the reigning king mentioned in this obelisk. But it may safely be attributed to *Pheron*, the son of *Sesostris*, who, according to Herodotus, erected two obelisks; and the occurrence of the name of Sesostris as the father may be considered as sufficiently conformable to the testimony of Pliny.[1] The same names are found, with a slight variation, on a small statue of basalt, very highly finished, now standing in the British Museum; and Denon has copied them from an inscription in the Memnonium (pl. cxviii.)

---

[1] The tomb of Amenoph III. is in the Western Valley of the Tombs of the Kings at Thebes. (R. S. P.)

[2] Another scarabæus of this king is interesting as one of the few Egyptian monuments, excluding the small mummy-shaped figures, of which more than one copy has been found, and on account of the remarkable character of its inscription, which gives the name and titles of Amenoph III. and his Queen Teey, and the parentage of the latter, as well as the extent of the king's dominions. After the mention of Teey occur these words: REN EN TEF-ES YUAÄ REN EN MUT-ES TUAW HEMT PU ENT SUTEN NESHT TEP SHTEEF. . . . . . . ER KERAY MEH . . . ER NEHAREENA—"The name of her father Yuaä, the name of her mother Tuaw, wife [she] is of the strong king, the extreme [of] his boundary southward to Karay, northward to Nehareena" (Rosellini *Mon. Stor.*, No. xliv., 1). Karay is supposed to be Coloë, in Ethiopia; and Nahareena is held to be Mesopotamia, the Aram-naharaim of the Scriptures. (R. S. P.)

[3] The name given as that of Amenses is the prenomen of a queen, Numt-amen, who reigned conjointly with Thothmes III. Manetho's Amenses is the Aähmes of the monuments, the wife of Thothmes I. (R. S. P.)

[4] The names here called Remesses and Heron are the prenomen and nomen of Usertesen or Sesertesen I., the first king of Manetho's Twelfth Dynasty. (R. S. P.)

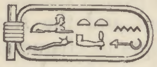
[5] This king is Nectanebo II., the third king of the Thirtieth Dynasty, who has the same prenomen as Usertesen I., and the nomen Neshtnebf or Neshtnef. (R. S. P.)

[6] Sesothis or Sothis, not Sesostris. "Is autem obeliscus, quem divos Augustus in circo magno statuit excisus est a rege Semenpserteo, quo regnante Pythagoras in Ægypto fuit, lxxxv pedum et dodrantis, præter basim ejusdem lapidis; is vero quem in Campo Martio novem pedibus minor a Sesothide" [or Sothide] (Plin. *Hist. Nat.*, lib. xxxvi., cap. viii., § 14). (R. S. P.)

44. Nuncoreus.

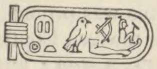
44. *Nuncoreus*, according to Diodorus, was another son of Sesostris:[2] his name occurs also in Pliny, and we may consider him as the son of Sesostris mentioned in Mr Montagu's friezes.[3] The name is also found at Philæ, and, with a slight variation, on an altar of basalt figured by Caylus (*Recueil*, tom. i., plate xix.), now in the King's Library at Paris. The remains of the same name may also be observed on a block, apparently of white sandstone, in the British Museum, which is figured by Norden, in its old situation, as a part of the foundations of Pompey's Pillar at Alexandria; and it occurs on a fragment of a statue brought by Mr Hamilton from Thebes.

45. Proteus.

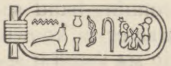


45. The name of *Proteus*, or Certus, otherwise Ammenephthes, is only known as the predecessor of one of the kings named Ramesses; and we may safely employ it for the father of the Remesses of the friezes of Montagu and Ficoroni, the whole of which are remarkable for the excellence of their workmanship.[4]

46. Amænuphthes.

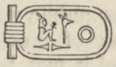


47. Anysis.

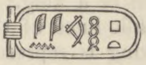


46, 47. Until we obtain evidence of a more positive nature, we may give to the two kings mentioned on the sarcophagus of green breccia the names of *Amænuphthes* and *Anysis*, supposing them to have lived about the time of Amenephthes, or Amenophis the Fifth, and his successor Osorchon. The father's name might, without difficulty, be read "Mænuphthah," supposing some titles to follow it.[5] There are also two obelisks of the same king, brought from Cairo, which stand near the sarcophagus in the British Museum; and the style of the workmanship somewhat resembles that of the times of Sesostris and his immediate successors. It has been observed that neither of the names can well be Alexander's, since that of the father is repeated much more frequently than that of the son, which could not have happened if it had been meant for Philip; and Alexander had no son who could have been mentioned in his sarcophagus.[6] Nor is it at all probable that Alexander should have erected any obelisks at Memphis or in its neighbourhood. The god Ammon is nowhere mentioned among the titles of the king, and holds only an inferior rank among the innumerable deities represented in the tablets. We find both the names, without any addition, on a dovetail of copper (engraved in Lord Valentia's *Travels*), which was found at Behbeit, the Atarbechis or Aphroditopolis of the ancients, situated on the branch of the Nile that runs to Damietta.[7]

48. Psammetius.



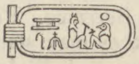
49. NECHAO.



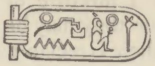
50. PSAMMIS.

48–50. We learn from Pliny that the Flaminian obelisk now standing near the Porta del Popolo at Rome, which was the smaller of the two formerly in the Circus Maximus, placed there by Augustus, and used as the gnomon of a dial, was the work of Senneserteus or Semnesyrteus, who reigned in Egypt at the time when Pythagoras visited it. This king seems to have been the same with Psammuthis or PSAMMIS; and the authority of the evidence is so much the stronger, as the period in question is not extremely remote. The father of Psammis, according to Herodotus, was Necos or NECHAO. The two names occur on all the middle lines of the obelisk; and that of the father on the pillar of a colossal Isis in the *Supplement* of Montfaucon. The Sallustian obelisk, which seems to have been partly copied from the Flaminian, has them both. In the middle lines of both the obelisks at Luxor we find a name much resembling that of Psammis, which we may therefore call PSAMMETIUS, conjecturing that it may have belonged to Psammetichus, who reigned a little earlier.[8] The father's name is not unlike in its import to that of Nechao, both implying *approved by Phthah;* and it is remarkable that in Manetho's series the predecessor of Psammetichus is also Nechao.

51. Mænuphthes.



52. AMASIS.



51, 52. Among the most common of all the names of the kings of Egypt, on a great variety of monuments, are those which were mistaken by Kircher for a sort of amulets or charms, which he denominated the Mophthomendesian tablets. They occur alone on three small obelisks only, the Medicean, the Mahutean, and the Monticælian of Kircher; but they are found in the external lines of the Alexandrian, the two at Luxor, the Flaminian, and the Sallustian, while none are ever found exterior to them.

---

[1] The name is that of Psammetichus I. of the Twenty-sixth Dynasty, written Psemetik. (R. S. P.)

[2] Diodorus Siculus does not mention Nuncoreus, but Pliny does. Perhaps Dr Young supposes this king to be the same as the Uchoreus of whom Diodorus speaks, but he was not a son of Sesostris. (R. S. P.)

[3] This name is the prenomen of Psammetichus II., of the Twenty-sixth Dynasty. (R. S. P.)

[4] The name read Proteus is Neshtnebf or Neshtnef, that of Nectanebo II. of the Thirtieth Dynasty. The friezes of Montagu and Ficoroni, the former of which is in the British Museum, are in bad style, though carefully executed. The earlier portions of the former are of the Egyptian Renaissance under the Twenty-sixth Dynasty, the later ones of its decline, to which the latter seems wholly to belong. (R. S. P.)

[5] These names are the nomen and prenomen, for the name is placed first in the woodcut of a king Her-nesht-heeb, who has been usually supposed to be Amyrtæus, the sole king of the Twenty-eighth Dynasty. Dr Hincks, however, conjectured him to be Manetho's first Nectanebo, the head of the Thirtieth Dynasty, and his correctness has been proved by the discoveries of M. Mariette (Lepsius, *Ueber eine Hieroglyphische Inschrift am Tempel von Ædfu, Abhandl. der K. Akad.*, 1855, p. 74). (R. S. P.)

[6] This is not strictly correct: either Alexander Ægus, the posthumous legitimate son of Alexander, or Hercules, his illegitimate son, might have been mentioned on a sarcophagus executed in Egypt after his death. (R. S. P.)

[7] The village here called Behbeit, but properly Bahbeyt el-Hagar, marks the site of the ancient Iseum, and near it may be seen the remains of a magnificent temple, the earliest name in which is that of Her-nesht-heeb. Perhaps this is the very temple of Isis which Nectanebo was commanded to build in the dream related in the papyrus bearing the title "Nectanebo's Dream." (R. S. P.)

[8] The names rendered Psammis and Nechao are the prenomen and nomen of Menptah Sethee I. (Sethos), head of the Nineteenth Dynasty; and the name represented by Psammetius is a form of the prenomen of Rameses II., the son and successor of Sethee I. (R. S. P.)

They must, therefore, necessarily be attributed to one of the latest kings of Egypt; and there is none so likely to have made such a display as AMASIS, a man of considerable magnificence, and at the same time of a cautious and artful character. Indeed we have no alternative left but to choose between him and some of the kings who revolted against the Persians, and who do not appear so likely to have had leisure or finances for public works of splendour. His father's name, like that of Nechao, contains the character denoting Vulcan, and it may be called *Mœnuphthes;* but he was not the son of a king.[1] Both the names are found in one of the middle lines of the Flaminian obelisk; and on that side the king is represented in the tablet as doing homage to his predecessor, who occupies the place of honour on the other sides. The father's name seems to occur on the belt of a colossal statue in the palace at Karnak. On a fragment of stone in the British Museum the names are repeated in various directions, as if it had belonged to a floor or a ceiling. They also occur on a statue, considerably mutilated, in the attitude of kneeling; and in Montfaucon's *Supplement*, on the back of a colossal Isis, which seems also to have been begun by Psammis. On the eastern colossus at Luxor there is a name which might be taken either for that of Amasis or for that of the pseudonymous Psammetius; but the sitting figure is somewhat different. The victor in the naval combat at Medinet-Habou,[2] who appears also frequently at Ombos, considerably resembles them both. Lord Mountnorris has a rough seal with the name of Amasis only, the epithet god being prefixed in a smaller character. The names also occur on a small obelisk lying at Tsan, the ancient Tanis, of which a sketch was brought home by Dr Merion.

53. Ptoleberius.

54. Discozygus.

53, 54. We find at Karnak the name of a king somewhat like Psammis, that of his father resembling a compound of Ptolemy and Berenice. Perhaps they are not very correctly copied, but they may stand, under the temporary names of *Discozygus* and *Ptoleberius* as specimens, somewhat singular, of a mixture of different dynasties; and in this point of view they may be placed between the old Egyptian kings and their Grecian conquerors.[3]

55. ALEXANDER.

ⲁⲗⲉⲝⲁⲛⲇⲣⲟⲥ

55. The name of ALEXANDER has not yet been identified in the sacred characters; but it will appear hereafter that a knowledge of the enchorial form may possibly contribute very materially, at some future time, to assist us in determining it.[4]

56. PTOLEMY.

ⲡⲧⲟⲗⲉⲙⲉⲟⲥ

56. There can be no doubt whatever respecting the signification of the name of PTOLEMY, as it occurs on the stone of Rosetta; but it is not quite so easy to determine its identity in some other cases, where it may possibly have been modified by contraction, mutilation, or combination. In this and a few other proper names, it is extremely interesting to trace some of the steps by which alphabetical writing seems to have arisen out of hieroglyphical; a process which may indeed be in some measure illustrated by the manner in which the modern Chinese express a foreign combination of sounds, the characters being rendered simply *phonetic* by an appropriate mark, instead of retaining their natural signification; and this mark, in some modern printed books, approaching very near to the ring surrounding the hieroglyphic names. The enchorial name of Ptolemy appears at first sight to be extremely different from the hieroglyphical; and it would have been impossible to deduce the one from the other, without a knowledge of the epistolographic forms of the separate characters, as ascertained by a comparison of the manuscripts. The beginning and end are obviously parts of the ring which, in the sacred character, surrounds every proper name,[5] except those of the deities. The square block and the semicircle answer invariably in all the manuscripts to characters resembling the P and T of Akerblad, which are found at the beginning of the enchorial name. The next character, which seems to be a kind of knot, is not essentially necessary, being often omitted in the sacred characters, and always in the enchorial. The lion corresponds to the LO of Akerblad, a lion being always expressed by a similar character in the manuscripts; an oblique line crossed standing for the body, and an erect line for the tail. This was probably read, not LO, but OLE; although, in more modern Coptic, OILI is translated, a *ram;* we have also EIUL, a *stag;* and the figure of the stag becomes in the running hand something like this of the lion. The next character is known to have some reference to *place*, in Coptic MA; and it seems to have been read either MA, or simply M; and this character is always expressed in the running hand by the M of Akerblad's alphabet. The two feathers, whatever their natural meaning may have been, answer to the three parallel lines of the enchorial text, and they seem in more than one instance to have been read I or E; the bent line probably signified great, and was read OSH or OS; for the Coptic *shei* seems to have been nearly equivalent to the Greek *sigma*. Putting all these elements together, we have precisely PTOLEMAIOS, the Greek name; or perhaps PTOLEMEOS, as it would more naturally be called in Coptic.[6] The slight variations of the word in different parts of the enchorial text may be considered as expressing something like aspirations or accentuations.

57. SOTERES.

57. The appellation SOTERES, as a dual, is well marked in the inscription of Rosetta, and the character, thus determined, explains a long name in the temple at Edfou, which must mean "the two saviour gods," with various titles of honour, such as "the agents of Phthah, the em-

---

[1] The names read Mænuphthes and Amasis, are the nomen and prenomen of Rameses II., the second king of the Nineteenth Dynasty. (R. S. P.)

[2] This king, the builder of the great temple of Medeenet-Haboo, is Rameses III., of the Twentieth Dynasty. (R. S. P.)

[3] These two names are incorrectly copied. (R. S. P.)

[4] The enchorial name here given is that of Alexander the Great, since it forms, with the addition of the determinative for city, the name of Alexandria on the Rosetta Stone. The Alexander of the hieroglyphics is the *fainéant* Alexander Ægus, in whose name the first Ptolemy governed. (R. S. P.)

[5] The ring surrounds the names of royal personages alone—always of kings and queens, and sometimes of princes and princesses. The names of private persons sometimes contain that of the monarch under whom they were born, and hence, perhaps, arose Dr Young's mistake. (R. S. P.)

[6] The characters of the name of Ptolemy are all simply alphabetic, not syllabic in any case. They read, in the example given, in the hieroglyphic form, PTURMEES or PTULMEES, and in the demotic, PTULMEES. At this late period the use of syllabic signs was almost, if not wholly, disused in foreign proper names. (R. S. P.)

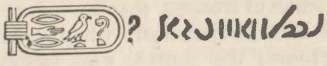
blems of triumph, the approved of Phre, the favoured of the Nile, the venerable consorts in empire."

53. BERENICE

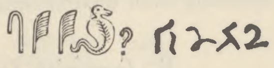
58. The wife of Ptolemy Soter, and mother of Philadelphus, was Berenice, whose name is found on a ceiling at Karnak, in the phrase, " Ptolemy and . . Berenice, the saviour gods." In this name we appear to have another specimen of syllabic and alphabetic writing combined, in a manner not extremely unlike the ludicrous mixtures of words and things with which children are sometimes amused; for, however Warburton's indignation might be excited by such a comparison, it is perfectly true that, occasionally, the sublime differs from the ridiculous by a single step only. The first character of the hieroglyphic name is precisely of the same form with a basket represented at Biban-el-Molouk, and called, in the description, *panier à anses ;* and a basket, in Coptic, is BIR. The oval, which resembles an eye without the pupil, means elsewhere *to*, which in Coptic is E ; the waved line is *of*, and must be rendered N ; the feathers I ; the little footstool seems to be superfluous ; the goose is KE, or KEN. Kircher gives us KENESOÜ for a goose, but the ESOÜ means gregarious, probably in contradistinction to the Egyptian sheldrake, and the simple etymon approaches to the name of a goose in many other languages. We have, therefore, literally Birenice ; or, if the N must be inserted, the accusative Birenicen, which may easily have been confounded by the Egyptians with the nominative. The final characters are merely the feminine termination.[1] The enchorial text affords us a remarkable instance of the diversity which was allowed in the mode of representing the same name. The first character has not the least resemblance to the basket; but the first and second together are very commonly used in the manuscripts, as a coarse representation of a boat, which was called BARI, or possibly BERE ; for it is doubtful whether Kircher had any other authority than that of Diodorus for BARI, and the word BEREZOUTS is used for another vehicle. The enchorial N may possibly have been derived from a horizontal line, turned up at one end. We have then the three dashes for the I, and the two angles seem to have answered to the KE, for a bird is not uncommonly scribbled in some such manner ; so that we have either Barinice or Berenice, by a combination somewhat different from the former.

59. PHILADELPHUS.

60. ARSINOE.



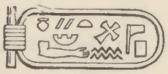
61. EUERGETES.



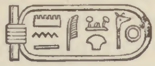
62. PHILOPATOR.

63. EPIPHANES.

64. PHILOMETOR.



65. Cleopatrides.



59–65. The temple at Ombos was dedicated, as we find from the Greek inscription copied by Mr Hamilton, " in the name of the divine Ptolemy Philometor and Cleopatra, and their children, to Arueris Apollo, and the other gods of the temple, by the infantry and cavalry of the nome." We may therefore expect to find in it the names of these sovereigns, together with those of some or all of the earlier Ptolemies ; and, accordingly, we are able to determine, without difficulty, some epithets which seem to be characteristic of this and the two preceding reigns ; but hitherto nothing has been observed that can be considered as so clearly denoting either Philadelphus and his queen Arsinoë, or Euergetes and his Berenice, although some assistance might have been derived, in identifying them, from the enchorial text of Rosetta. We have, however, in the same temple, a name, evidently compound, in which a basilisk is followed by two feathers and a bent line ; and to judge from a comparison of the enchorial text with the manuscripts, a basilisk ought to be the emblem of Euergetes.[2] The part of the name preceding it is, however, not Berenice, and must, therefore, in all probability, be Arsinoë, the daughter of Euergetes. But it seems impossible to attempt to compare the characters employed with the sounds ; since they sometimes occur in an inverted order, which the sounds could not do. Indeed, the name seems to be very often repeated in situations where its most essential parts seem to be a quadrant of a circle, two feathers, and a bent or broken line ; in other places, as at Denderah, the bird, the hand, and the oval, are added ; and it is not impossible that the quadrant may have been meant as a representation of a lentil, which in Coptic is ARSHIN, and which alone may have been sufficient to identify the name. It occurs in the celebrated zodiac of Denderah, and very frequently at Philæ, and it may possibly, hereafter, lead us very readily to discover the hieroglyphical name of *Philadelphus.*[3] That of Philopator is satisfactorily ascertained by the assistance of the character employed for *father* in the Rosetta Stone, though that character is much mutilated, and could not have been positively determined without this coincidence. The name is found in the great temple at Edfou still more distinctly than at Ombos, and it occurs several times at Karnak. Epiphanes is never distinguished in any other inscription by the characters appropriated to him in that of Rosetta (No. 121) ; but we continually find a synonymous emblem, which is employed in the Rosetta Stone to signify *enlightening*, where the Greek translation has Epiphanes ; and this character, placed between two hatchets facing each other, can only have meant the *illustrious deity*, or *deities.*[4] In this form the name occurs very frequently at Philæ, and in the great temple at Edfou, where it seems to be the latest name. For the Philometores we have a character which occurs in some other monuments, and means apparently *mother*, the name containing it being found several times in the temple at Ombos.[5] At Kous, or Apollinopolis Parva, there is another Greek inscription of the Philometores and their children ; but in the hieroglyphics copied by Denon, the names of the sovereigns seem to be wanting, and that of a young prince only remains, a colossal statue of whom is figured by Montfaucon in his *Supplement*, having the same name in the belt, with the addition of *the son of King Ptolemy ;* it will, therefore, be justifiable to distinguish this personage by calling him *Cleopatrides.*[1] The divine honours which are so often attributed in these inscriptions to the reigning sovereigns, afford us an explanation of the Greek inscriptions to the *Synthronous gods of Egypt*, which repeatedly occur; and of the description *Fraternal gods*, as, indeed, Philadelphus and his queen are called in the Greek inscription of Rosetta.

---

[1] The name of Berenice reads, in the hieroglyphic and demotic forms given in the woodcut, BERENEEKA. As in the name of Ptolemy Dr Young was in error in reading some of the characters composing it to be syllabic. (R. S. P.)

[2] This is no name or title of a king. (R. S. P.)

[3] The hieroglyphic name given as that of Arsinoë, is a form of Autocrator incorrectly copied, but the demotic name is that of this queen. (R. S. P.)

[4] The proper title for Epiphanes, HER, occurs in the Rosetta Stone ; the hieroglyphic title in the woodcut is part of the prenomen of Physcon, but it is sometimes also given as a title to Epiphanes. (R. S. P.)

[5] This name is the prenomen of Auletes. (R. S. P.)

C. *Private Persons.*

Private persons.

66–71. We find the names of six individuals expressed in the enchorial text of the inscription of Rosetta, though they are wanting in the distinct hieroglyphics; but, as they are clearly ascertained by the context, they are of considerable value in tracing the approach of the hieroglyphic to alphabetic writing. These are, AËTUS, PHILINUS, DIOGENES, PYRRHA, AREIA, and IRENE.

66. AËTUS.

67. PHILINUS.

68. DIOGENES.

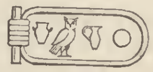
69. PYRRHA.

70. AREIA.

71. IRENE.

In Diogenes and Areia we discover no traces of the ring which is the usual characteristic of proper names; and, on the other hand, we find occasionally, in some of the manuscripts, the parts of the ring applied to a title of Osiris, which is more regularly written without any such distinction.

72. Ramuneus.

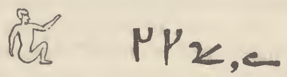


72. A name of a private individual is inserted from a sarcophagus in the British Museum, engraved by Alexander in his *Egyptian Monuments.* Its form is not that of a parallelopiped, but more accommodated to the shape of the body. The pseudonymous appellation *Ramuneus* has been derived from the elementary characters already observed in the names of RE and AMUN.[2]

D. *Animals.*

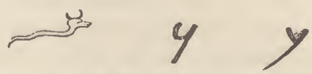
Animals.

73. A MAN.
ρωμι



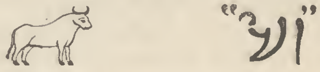
73. A figure sitting on the ground, and stretching out one hand, seems to imply simply a MAN or person, which is certainly the sense of the enchorial character that commonly answers to it in the manuscripts; but in composition the figure often appears to lose this sense.[3]

74. HIM.
ϥ,ⲙⲙⲟϥ

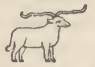


74. The horned snake, creeping along, is clearly meant, in some parts of the inscription of Rosetta, for HIM or IT; although it has other senses in composition. It is very remarkable that the enchorial character, and that of the manuscripts, resembling a Y, approaches extremely near to the Coptic F, which also means *him;* and HOF, or HFO, is the Coptic term for a snake; so that this coincidence seems to afford us another trace of the origin of the alphabet.[4]

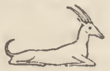
75. BULLOCK.
ⲉϩⲉ



76. RAM.
ⲱⲓⲗ



77. ANTELOPE.



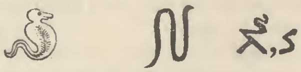
78. TORTOISE.
ⲉϥⲱⲧ

75–78. The BULLOCK, the RAM, the ANTELOPE, and the TORTOISE, are proved to be sometimes representations of the things which they resemble, by their occurrence in inscriptions accompanied by tablets; though some of them have probably elsewhere a metaphorical sense.[5] The ram is often represented with two pairs of horns; the one natural, the other imaginary.

78*. CROCODILE.

78*. The CROCODILE is identified by a very distinct drawing in a manuscript sent home by Mr Bankes, and is repeatedly designated in the text by a figure representing it. The deity with a crocodile's head is a separate personage, and is denoted by a figure of the same animal with the tail turned under it.[6]

79. BASILISK.
ⲟⲩⲣⲟ



79. The asp or BASILISK is so coarsely represented in the stone of Rosetta, that the object intended by it could not have been conjectured without a comparison with other inscriptions; the context was, however, sufficient to determine its meaning from the examination of this monument alone.

E. *Inanimate Objects.*

Inanimate objects.

80. EGYPT.
χημι

80. The essential parts of the name of EGYPT seem to be the square and the wheel, signifying *splendid land.*[7] In

---

[1] This is the prenomen, incorrectly copied, of Philadelphus. (R. S. P.)

[2] This is the prenomen of Amasis of the Twenty-sixth Dynasty. (R. S. P.)

[3] The principal uses of this character are as determinative of proper names of men and the like, and for the affixed pers. and poss. pronouns of the 1st sing. for the masc. (R. S. P.)

[4] The horned snake or cerastes is a common alphabetic sign for the letter we have represented by F, both in its hieroglyphic and its demotic form; from the latter originated the Coptic character for the same letter. It is also used for the affixed pers. and poss. prons. 3d sing. masc. (R. S. P.)

[5] Thus the bull signified "male," and the ram "soul," in a tropical sense. (R. S. P.)

[6] The crocodile-headed god is named Sebak, and his usual symbol is a crocodile standing upon a shrine. (R. S. P.)

[7] The character here called a wheel, is the determinative of the names of Egypt and those of Egyptian districts, cities, and the like. The character which precedes it in the hieroglyphical group in the woodcut is the sign for *h*, which may here have an ideographic use. The two signs appear in this place to denote Egypt. (R. S. P.)

addition to these, or their rudiments, the enchorial word has at the beginning a character which generally answers to an arm holding a feather, or to the flame of a lamp, an emblem which seems also to relate to Egypt in one of the lines of the inscription of Rosetta. A flame and a heart are mentioned by Horapollo and by Plutarch as employed in the name of *Egypt;* but a word occurring so frequently is very likely to have been expressed in a variety of ways. The exact combination of characters generally used on the stone has not been observed in any other inscription.

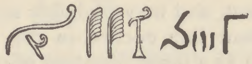
81. MEMPHIS.
ⲙⲉϥⲓ

81. The name of MEMPHIS cannot be determined without some uncertainty; the line of hieroglyphics in which it is contained being in several respects obscure.[1]

82. RIVER.
ⲓⲁⲣⲟ, ⲓⲟⲣ

82. The character supposed to denote the Nile as a deity must also sometimes be understood as merely meaning a RIVER; and there is reason to think that the Nile itself was generally called by the Egyptians *the river* only. The enchorial character used to denote both the Nile and a river, or canal, sufficiently resembles the hieroglyphic to favour this interpretation; and it is in some degree confirmed by the occurrence of the character alone on a water-jar of Peiresc, delineated in Kircher's *Œdipus*, and, together with other characters, on the five vases found by Paul Lucas at Abousir. By accident, Kircher appears, in this single instance, to have been right in one of his conjectures; for he calls this character a nilometer, and considers it as emblematic of the Nile.

83. GREEK.
ⲟⲩⲉⲓⲛⲓⲛ



83. The word GREEK, in Coptic UININ or OUEININ, in Thebaic OUEEIENIN, supposed to have been derived from *Ionian*, seems to exhibit in its form something like an imitation of the sound. The curve on a stem is sometimes exchanged for the term *divine*, and appears to mean *glory*, in Coptic OOU or OŪ, which is nearly the sound attributed by Akerblad to the enchorial character, a little like the Hebrew U. The feathers, as in Ptolemy and Berenice, may be read I or EI, having the three dashes to express them, as usual, in the enchorial text; the serpent is ENEH, *ever;* and the hat, which looks a little like a plough, is equivalent to the waved line (No. 177), and must be read N; so that we have very accurately OUIENEHN, which seems to be near enough to OUEININ to justify us in considering these characters as phonetic.[2]

84. COUNTRY.
ⲓⲟϩⲓ, ⲕⲟⲓ

84. The ladder is well marked as meaning COUNTRY. It may perhaps be intended to represent a field with its divisions; but it is uncertain whether or not it is the same symbol that enters into one of the names of Arueris (No. 13), the sculptures of the Rosetta Stone being by no means highly finished.[3]

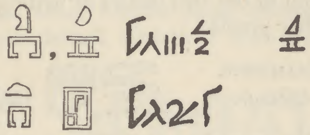
85. LAND.
ⲕⲁϩⲓ

85. It is remarkable that the wheel, signifying LAND, had been noticed by the Jesuits as resembling the old Chinese character for the word *field;* but this is the only one of a multitude of similar conjectures which has been justified by more complete evidence (*Phil. Trans.* 1769, pl. xxviii.)[4]

86. STAR.
ⲥⲓⲟⲩ

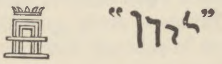
86. The star is shown, by inscriptions accompanying the zodiacs, to relate to a real STAR. It has also elsewhere a figurative sense, meaning an attendant or *ministering spirit.*[5]

87. TEMPLE.
ⲉⲣⲫⲉⲓ



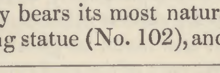
87. The open square is found in both the combinations of characters which are most commonly used for expressing a TEMPLE; the feather signifies ornament or consecration, the oblong figure either the sacred inclosure or a sacred seat, the character for a god being sometimes placed within it.[6] The feather is occasionally converted into an inclined oval, the square being at the same time a little altered; a difference which may be observed in other inscriptions as well as in the Rosetta Stone.

88. SHRINE.



88. The character representing a SHRINE so much resembles the object which it denotes, that it was the most readily identified of all that are found on the stone of Rosetta. The character signifying a *priest* was the second; and the combination of both afforded a full confirmation of the truth of the explanation. The enchorial character for a shrine is derived from the sitting statue which always accompanies it.

89. HABITATION.
ⲏⲓ



89. The open square, occurring in HABITATION as well as in *temple*, must probably have meant *house* or *building*, or possibly *stone* only.

90. THRONE.
ϩⲉⲙⲥⲓ

90. The THRONE, or chair of state, occurs in a great variety of tablets. It evidently bears its most natural signification in the character denoting statue (No. 102), and in some other

---

[1] The hieroglyphic group here given is not the name of Memphis; the demotic is, however, rightly attributed, and reads, like the hieroglyphic equivalent, MEN-NUFR, "the good abode," Plutarch's ὅρμον ἀγαθῶν (*De. Is. et Osir.* cap. 20). (R. S. P.)

[2] The characters given by Dr Young are not those for "Greek," which immediately follow them on the Rosetta Stone, and it may be observed that the first of them is inaccurately copied. The hieroglyphic name reads HUEENEN, and must rather be regarded as sprung from a common origin with the Greek Ἴωνες, perhaps from the Hebrew יאין, since it is found in the inscriptions of the Eighteenth and Nineteenth Dynasties, as the name of a conquered country or people. The earliest of these mentions of the HUEENEN known to us is of the reign of Thothmes IV., B.C. *cir.* 1400. (R. S. P.)

[3] This signification of country, or rather region, is correct. (R. S. P.)

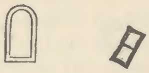
[4] The oldest Chinese characters having been originally ideographs, present some similarities with the Egyptian hieroglyphics; but these may be fairly regarded as accidental, and we cannot venture to reason on anything but the circumstance that both nations used ideographic characters. (R. S. P.)

[5] The proper signification of this ideographic sign is "a star," the tropical "a god." (R. S. P.)

[6] The "open square" signifies a "house" or "abode," for it represents the ground-plan of a house or room: with the addition of an ostrich feather, the symbol of truth and justice, or of a hatchet, the symbol of divinity, it stands for a temple. (R. S. P.)

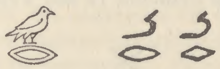
instances; but it appears to bear, in some inscriptions, the metaphorical sense of a residence or habitation.[1]

91. COLUMN.
ϫⲏⲣⲓ.ⲑⲟⲩⲟϯ



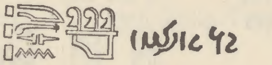
91. The COLUMN, or pillar, is too much like the object it denotes to allow us to doubt respecting its meaning, considering the sense of that part of the inscription of Rosetta in which it occurs.[2]

92. DIADEM.
ϫⲗⲟⲙ



92. The characters denoting a DIADEM are sufficiently determined by the first inscription of the stone; and they so much resemble the corresponding passages of the enchorial text, that we can scarcely hesitate to admit the intimate connection of the two modes of writing without seeking for any further proofs.

93. ORNAMENTS.
ⲥⲉⲗⲥⲱⲗ



93. The sacred ORNAMENTS are expressed by three feathers fixed to a bar, which appears to be held by two arms. The remaining part of the character occurs very frequently as a sort of termination, and seems to answer to . . *ments.*

94. SHIP.
ⲃⲁⲣⲓ

95. SPEAR.
ⲛⲁⲃⲓ,ⲙⲉⲣⲉϩ

96. BOW.
ⲫⲓϯ

97. ARROW.
ⲥⲟⲑⲛⲉϥ

98. CENSER.
ⲙϣⲓⲣ

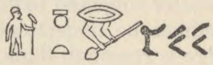
99. BIER.
ⲥⲗⲏ

94–99. The boat or SHIP, the SPEAR, the BOW, the ARROW, the CENSER, and the BIER, are sufficiently identified by the comparison of various tablets with their inscriptions. The *ship* occurs frequently as denoting the sacred boats, in which the representations of the deities are conveyed, though they are not always accompanied by water. But it has been observed that the Egyptians attributed ships rather than chariots to the sun and moon as gliding smoothly through the skies. The first part of the enchorial word, which has been supposed to be a B, is evidently identical with the character always found in the manuscripts written in the running hieroglyphics as the first part of the delineation of a ship. It is remarkable, that in the inscription at Esne, as copied by the French, the point of the arrow is turned towards the back of the bowman, instead of being directed towards the enemy.

100. TEAR.
ⲉⲣⲙⲏ

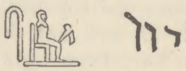
100. The TEAR, in some of its representations, is very clearly expressive of the thing intended; and this resemblance, together with its frequent attendance on a corpse and a bier, is sufficient to explain its sense. It occurs also sometimes within a border as a peculiar deity; but it seems to be much more commonly emblematical of Osiris, of Apis, or of Mneuis. It is not unfrequently found as a detached figure, in a kind of pottery, with a green glazing, and may perhaps have been worn, instead of a mourning ring, as a memorial of a departed friend. It has most commonly been called the *equi sectio,* and supposed to represent a horse's head, or the rostrum of a ship, while the ingenious Kircher has made it a *phallus oculatus.* Among the antiquities collected by Lord Mountnorris in Egypt is an eye seen in front, and apparently shedding a tear.

101. IMAGE.
ⲥⲙⲟⲧ,ⲙⲟⲛⲕ



101. The character for an IMAGE seems to mean *a wrought man:* the hands, connected with an eye, appear to be holding an oar as an emblem of *labour.* The same character, with a slight variation in the form of the eye, means a rower (No. 136).

102. STATUE.
ⲓⲛⲓ?ϣⲕⲟⲩⲓ?



102. The sitting STATUE has no character to imply wrought; but it is followed by a bent line which seems to be a term of respect, and may probably answer to OSH, or *great.* The same bent line occurs on the great sarcophagus of green breccia as a personification of one of the qualities of Osiris, probably his *magnificence.* It is often exchanged in the manuscripts for the divided staff; and both are represented in the running hand by a figure like a 9 or a 4. In the enchorial text this character seems sometimes to be expressed by a single line, either straight, or bent sideways into an angle like part of a K. A similar *divine statue* is decreed to "King Nuncoreus, the son of Sesostris," on Mr Montagu's frieze. (See *Hieroglyphics,* 7 S l.)

103. LETTERS.
ⲥϧⲁⲓ

103. LETTERS are denoted by a character which seems to represent some of the materials employed in writing, and which is indeed not extremely unlike an inkstand figured in Caylus's *Recueil,* and consisting of two parallel tubes at some distance from each other, with a cover connected by a chain instead of a hinge. Besides the very well marked passage in the Rosetta Stone, the character occurs in many manuscripts near the representation of a Thoth employed in writing; and the enchorial character corresponding to it is also found in the term [*hierogrammatists* or] *sacred scribes* at the beginning of the inscription.[3]

104. Weight.
ϣⲓⲉ

104. In the numerical tablet of the great French work,

---

[1] The signification of this character, which represents a *seat* and not a throne, is "seat:" thus, when combined with the ostrich feather, it forms the compound word "seat of judgment," or "hall of justice." In No. 102 it has no signification, being merely the seat of the figure. (R. S. P.)

[2] This ideograph represents a stela, and in the Rosetta Stone is the determinative of the word HAY, a stela, lit. "a thing set up." (R. S. P.)

[3] The scribe's implements signify "to write, engrave, sculpture, a scribe," &c., and serve to determine the word S-SHEE, "to write," &c. (R. S. P.)

believed to have been found at Karnak, a character may be observed which frequently precedes a numeral, and which resembles a weight with its handle. Hence we may conjecture, with considerable probability, that it represents some *weight* of unknown value.

105. GOLD.
NOYB

105. The enchorial character for GOLD is perfectly well determined; and its resemblance to a little vase under a sort of arch is so strong that we may safely attribute the same sense to this hieroglyphic, although it appears to be wanting in one or two passages of the sacred inscription of Rosetta, where it ought to be found.[1] In the great ritual we observe this character immediately preceding a shrine, as if a *golden shrine* were intended; and, in several other places, it is connected with a number, as if it meant *pieces of gold;* for instance, in the green sarcophagus, with the number 360. Sometimes, also, it appears to be used in a metaphorical sense as a complimentary epithet of a monarch, or perhaps in allusion to his riches. Thus, on the black frieze of Nuncoreus, we have over the king's figure the characters, "Joy, Life, Stability, Power, *Riches*, Like the Sun, for ever." (*Hieroglyphics*, 7 p.)

106. SILVER.
ϩⲁⲧ

106. Near to the character for gold, in the margin of the great ritual, is a sort of open box, supported on a flagstaff; and a similar box, with a semicircle under it, seems to mean SILVER, at least it considerably resembles the enchorial character for silver, which is perfectly well ascertained.

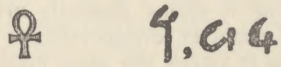
107. Offerings.

107. We find, in several inscriptions, representations of objects which are also observable in the tablets accompanying them, although it is difficult to say for what they are intended. Two of these are copied from the frieze of Ficoroni and Montagu (*Hieroglyphics*, 9 okl, Rskl, 7 LMq). The former seems to be a sort of cloak, with a fringe at the bottom; and the latter is a little like a pear; but this character does not occur so clearly in the inscription.

F. *Attributes and Actions.*

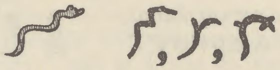
Attributes and actions.

108. LIFE.
ⲱⲛϧ, ⲁϩⲓ



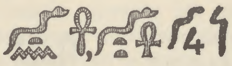
108. The *crux ansata*, sometimes called the Key of the Nile, is usually employed as a symbol of divinity; but its correct meaning is LIFE, as Lacroze rightly conjectured, although his opinion respecting the origin of the character is inconsistent with the form of its oldest and most accurate delineations; and there is no one instance in which it is so represented as to stand in any relation to a sluice or a watercock. According to Socrates and Rufinus, the Egyptian priests declared to their Christian conquerors under Theodosius, who were going to destroy the Serapeum at Alexandria, that the cross, so often sculptured on their temples, was an emblem of the life to come.[2] This passage has been understood by some authors as relating rather to the cross without a handle, which is observable in some rare instances, and indeed twice on the stone of Rosetta; but this symbol appears rather to denote a protecting power than an immortal existence. It happens, perhaps altogether accidentally, that one of the contractions for the word *God*, which are commonly used in Coptic, approaches very near to this character, except that the arms of the cross are within the circle.

109. ETERNITY.
ⲉ̀ⲛⲉϩ



109. ETERNITY is represented simply by a serpent rising in an oblique arch, and without horns; the serpent devouring its tail, and making a ring, is never found as an Egyptian emblem. Horapollo says that eternity was denoted by a serpent having its tail hidden under its body, and that such serpents were called *uræi*, meaning in Greek *basilisks*, which agrees very well with the sense of the Coptic URO, *king;* but this description answers better to the *asp* of the inscription of Rosetta, which has also some relation to the representations of the deities, though it does not exactly mean immortality.[3]

110. IMMORTAL.
ⲉⲧⲟⲛϩ ⲉ̀ⲛⲉϩ



110. The cross with the serpent is a very common epithet in the sense of everliving, or IMMORTAL, or ÆONOBIUS; the waved line is in general a preposition, or a termination, meaning *of*, *to*, or *for;* and it appears to be synonymous with the hat (No. 177). Almost all authors have very hastily taken for granted that this character must relate immediately to water wherever it occurs, although we find it repeatedly in every line of the inscription of Rosetta, where water is not once mentioned. The fact, however, is, that its prototype seems to have been a stream of water, or of any other liquid, flowing *from* a vessel, and poured *on* some other object; and that the idea of the liquid was completely dropped in the general employment of the character, whilst that of the *connection* only was retained; and the hat or cap being also similarly forgotten, whilst its connection with the head of the wearer only was suggested by its figure. In this compound character we have two particles nearly alike, the semicircle and the line; for that they cannot be very different is shown by the occasional substitution of two semicircles for the combination. One of them seems to serve for the connection between life and eternity, "life *for* ever;" and the other to make the new compound an adjective, "liv*ing* for ever."[4]

111. JOY.
ϩⲙⲟⲧ? ⲣⲁϣⲓ?

111. The triangle or pyramid occurs very commonly among other emblems of prosperity and happiness; and it is found in the frieze of Montagu and Ficoroni in the decided sense of an offering or a present in general, while in another place it is made an offering in its own form; so that we can only interpret it as signifying JOY, or pleasure, or prosperity.[5] (*Hieroglyphics*, 7 Mqr, Uqr; 9 Re, Rl; 7 Uq, Urs.)

112. POWER.
ϫⲟⲙ

112. POWER appears to be indicated by a sceptre having the head of an animal, which is often placed in the

---

[1] The hieroglyphic character signifies "dilation of the heart," and has no connection with the first of the two enchorial ones, which is rightly supposed to bear the meaning of "gold." (R. S. P.)

[2] The so-called *crux ansata* is simply an emblem of life. There is no doubt that this is the symbol spoken of, and it may be observed that it is seen at the head of some early Christian inscriptions instead of the cross. (R. S. P.)

[3] The basilisk, or asp, is a symbol of royalty. (R. S. P.)

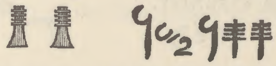
[4] The hieroglyphic groups, though neither of them correct in the last character, which should be a thick straight line, signify "living for ever." (R. S. P.)

[5] This sign signifies "to give, a gift, offering," &c. (R. S. P.)

hands of the deities, and often stands with the cross the pyramid, and the altar, as an emblem of the blessings attendant on the favourites of the gods. It is seldom used in the text of inscriptions, but it occurs once in that of Rosetta.[1]

113. STABILITY.
ⲧⲁϫⲣⲟ

114. ESTABLISHED.
ⲧⲁϫⲣⲏⲟⲩⲧ

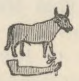


113, 114. Stability is denoted, on the Rosetta Stone and elsewhere, by the altar, which seems to have been fixed in the ground as a column. When repeated it makes the verb ESTABLISH; but it often occurs singly, and not uncommonly as an unconnected emblem, accompanied by other characters of similar import; and it is sometimes found as a detached figure formed of glazed porcelain. The two altars are very conspicuous objects in some of the epistolographic manuscripts, and are very useful in comparing them with the hieratic; but the word employed in the enchorial inscription of Rosetta seems to be derived from a different origin.[2]

115. STRENGTH.
ⲁⲙⲁϩⲓ

115. A drop or club over a basin, followed by a bent line, seems to mean GREAT STRENGTH, though it is difficult to say what the character is meant to depict. In some other places it seems somewhat to resemble a kind of head-dress.

116. MIGHTY.
ϫⲟⲣ



116. The bullock and the arm, which generally occur at the beginning of the inscriptions on the obelisks, agree very well with the epithet MIGHTY in the translation of Hermapion. The arm is, in many other instances, used in compound characters.

117. VICTORY.
ϭⲣⲟ

117. Victory is denoted by a branch, perhaps a palm-branch, with a semicircle and a circle, sometimes preceded by the waved line.[3]

118. FORTUNE.

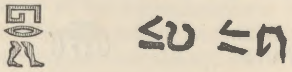
118. The character signifying FORTUNE somewhat resembles that which denotes *gold* (No. 105); but instead of the arch we have an angular line, which seems to be intended for a pair of arms grasping the vase. The whole assemblage approaches also a little to the form of a pocket, or purse, as it is frequently delineated.[4]

119. SPLENDOUR.
ϣⲟⲩ, ⲟⲩⲱⲓⲛⲓ

119. The open square, bent inwards, clearly means SPLENDOUR or glory, though it is uncertain what object it is intended to represent. In some cases a crescent seems to be substituted for it, as if it bore some relation to the sun, and the moon afforded a parallel sense.[5]

120. BEARING.
ϥⲁⲓ

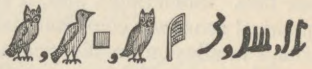
121. ILLUSTRIOUS.
ⲫⲉⲣⲓⲱⲟⲩ



120, 121. Illustrious is expressed, in the inscription of Rosetta, by the open square, for *splendour*, the oval, which signifies addition or respect, making it a kind of superlative, and the pair of legs, which very naturally convey the idea of BEARING, or possessing; so that the whole makes the epithet Epiphanes.[6] This assemblage is, in some of the manuscripts, very commonly followed by a bird, or its equivalent, a half arch, apparently serving as an intensitive.

122. HONOUR.
ⲧⲁⲓⲟ

123. RESPECTABLE.
ⲙ̀? ⲙ̀ⲡϣⲁ?



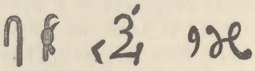
124. VENERABLE.
ⲛⲓϣⲧ? ⲛⲁⲓⲁⲧ?

122-124. The feather,[7] when alone, seems to imply HONOUR, as well as when accompanied by a man stretching out his arm, or by a bird. The bird also frequently stands alone in similar passages,[8] and must be translated RESPECT, or RESPECTABLE. The block with the bird has also manifestly the same sense in the great ritual, and the vase with the bowl is so nearly synonymous with it that we can only translate it VENERABLE;[9] and these characters are frequently exchanged for a sort of bench, with a dash under it, a symbol which may, however, possibly have been deduced from some different origin. The sense of the feather is peculiarly illustrated by its occurrence with a drop or club, a serpent, and a line, at the beginning of a great variety of inscriptions, apparently signifying *immortal honour to.* (See No. 172).

125. RITE.
ⲡⲉⲧⲥϣⲉ

125. The eye, either with or without the pupil, and either preceded or followed by the undulated line, has a sense somewhat similar to all these, and is often employed at the beginning of the honorary inscriptions. On the Rosetta Stone it means distinctly RITE or adoration. The enchorial character corresponding to it expresses also simply *doing;* as in Greek the same word signifies *to do* and *to sacrifice.*[10]

126. WORSHIP.
ϣⲁⲙϣⲉ



126. Worship, or the Greek THERAPEIA, is denoted by a very unintelligible character, resembling a kind of capstan, which is frequently delineated in the boats of the tablets, if it is not intended for some emblematical figure

---

[1] This sign is held to mean "purity, pure." (R. S. P.)

[2] It is doubtful what this sign represents, but its signification of stability is unquestionable. (R. S. P.)

[3] This group, which is most fully written with the waved line before the branch, which, it may be noted, is not a palm-branch, reads NESHT, and signifies "strength, strong, victory, victorious." (R. S. P.)

[4] This is an incorrect rendering. (R. S. P.)

[5] This sign is used as the initial of the word HER, "manifested," corresponding to Ἐπιφανὴς, as in the Rosetta Stone (No. 121). (R. S. P.)

[6] The legs are simply the determinative of the word mentioned in the previous note, written with the open square bent inwards, or meander, the mouth, here called the oval, and the legs. This determinative follows words relating to motion, and is therefore applied to this, of which the primary signification is "to come out." (R. S. P.)

[7] This character is a reed, denoting the vowel A. (R. S. P.)

[8] The reed and owl, or owl alone, denote the prep. AM or M, "in," &c. (R. S. P.)

[9] This is the isolated personal pronoun, 1st sing. com. "I." (R. S. P.)

[10] The eye signifies "to make" or "do." At the commencement of a proscynema, followed by the waved line, it should be read "made by," that is, "this act of adoration is made by ——." (R. S. P.)

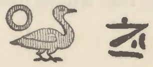
erected in the boats.[1] On the great green sarcophagus, the long bent line is a snake, and the point projecting upwards from the middle is a sword. But these resemblances afford us little or no assistance in tracing the connection between the whole emblem and its sense.

127. FATHER.
ⲓⲱⲧ

128. MOTHER.
ⲙⲁⲩ

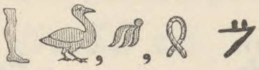
127, 128. The character denoting FATHER,[2] is found in some of the inscriptions of the Ptolemies in such circumstances that it might as easily be supposed to mean mother; but, by means of Mr Bullock's scarabæus, compared with some other monuments, another character having been determined for MOTHER,[3] it became easy to identify the symbol for father on the Rosetta Stone, where it had been a little injured, and imperfectly copied in the engravings.

129. SON.
ϣⲏⲣⲓ



129. The frequent occurrence of the Egyptian goose or sheldrake, with a circle over it, between two proper names, sufficiently points out the meaning of these characters, which can only relate to the connection between them, and which must naturally mean SON. The circle may perhaps be intended for an egg; but in the painted sculptures the disc is red and the circumference light.[4] The enchorial character nearly resembles the form in which some kinds of birds are usually expressed in the manuscripts (Nos. 22, 130). Mr Bailey has also observed the occurrence of the bird between two proper names, and has identified it with the CHENALOPEX mentioned by Horapollo as employed to signify son, on account of its courage in defending its offspring. This quality might rather have been expected to lead to its adoption as a symbol for a parent; but its existence in the bird in question is confirmed by the observations of modern naturalists respecting the sheldrake (the *tadorne* of Buffon), which has generally been considered as the chenalopex, and resembles very accurately the best of the hieroglyphical delineations of the bird, although the colours, as exhibited in the *Déscription de l'Egypte*, are not correctly natural.

130. ATTENDANT.
ⲃⲱⲕ? ϣⲫⲏⲣ?



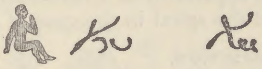
130. The same bird, with a leg or a dash instead of a circle, seems to mean a minister or ATTENDANT, especially in several parts of the inscriptions on the Lover's Fountain.[5] There are also some other characters which seem to be nearly synonymous with these; one of them may possibly be meant for a *tail*, implying a follower, as SAT and SA are nearly alike in Coptic; another is sometimes worn as a collar, perhaps implying subjection, and meaning servant.

131. DAUGHTER.
ϣⲉⲣⲓ

132. SONS.
ⲛⲓϣⲏⲣⲓ

131, 132. Instead of the usual character for *son*, we sometimes find, between two names, a serpent with a globe substituted for the bird, and an oval for the circle; and the context seems to require that the meaning of these symbols should be a DAUGHTER, but probably with some particular character of royalty or divinity;[6] and at Philæ we find a dual, meaning SONS or descendants, as a son and a daughter, expressed apparently by two circles only.

133. CHILD.
ⲁⲗⲟⲩ



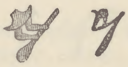
133. A CHILD, or *infant*, is represented by a figure bent as if sitting, and putting his finger on his lip.[7] This is sufficiently established by the triple inscription; but it is still further confirmed by a plate of the *Déscription de l'Egypte* (*Antiq.* tom. ii., pl. lxxxvi., fig. 1), in which a figure of this kind is represented as immediately derived from the father, who seems to be inspired by a beetle entering his mouth. The manuscripts afford us here some valuable steps by which the enchorial character is connected with the distinct hieroglyphics. Another figure, which is elsewhere used as corresponding to a beetle, is also found in the enchorial text in the sense of son or offspring.

134. DIRECTOR.
ⲣⲉϥⲥⲟⲩⲧⲉⲛ?

135. STEERSMAN.
ⲣⲉϥϩⲉⲙⲓ

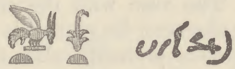
134, 135. A circle, with an arm holding an angular line, means a DIRECTOR.[8] The angular line is intended for part of a rudder; and the same character, with the addition of the figure of a boat, denotes the pilot or HELMSMAN, as is obvious from many parts of the green sarcophagus. The circle and arm are also found in the character denoting *dedicate* (No. 150).

136. ROWER.
ⲣⲉϥⲃⲟⲥⲉⲣ?



136. A pair of arms holding an oar, and connected by a sort of sector, signifies a ROWER, and possibly also a labourer, or workman in general, as in *image* (No. 101).

137. KING.
ⲟⲩⲣⲟ



137. A stem of a plant, perhaps a reed, followed by an insect like a wasp or ichneumon, but probably intended for a bee, and by two semicircles, is the complete emblem for a KING; but the reed is often used alone in the same sense, and the insect sometimes occurs without the reed.[9] Plutarch says that a king was denoted by a leaf, THRION; and

---

[1] It is doubtful what this character represents. Its signification, whether with or without the siphon as a complement, is "servant." (R. S. P.)

[2] These signs do not signify "father," a word which is written phonetically, with characters reading ATF. (R. S. P.)

[3] This character is often used for "wife," but not "mother," and reads HEMT. The vulture signifying, in its primary tropical sense, "female," is commonly employed as a symbol for "mother," with the addition of the sign of the feminine. (R. S. P.)

[4] These characters signify "son of the sun," a title usually preceding the second ring of an Egyptian king's name containing the nomen. The goose stands for "son," and the disk for "sun." The preposition "of," which would be in this case written with the wavy line, is rarely expressed in the group. (R. S. P.)

[5] The goose followed by the leg is the name of the god SEB, Chronus, the father of Osiris, written phonetically. (R. S. P.)

[6] This group means son of the sun, the egg being used for the word son, and the sun being represented by a combination of the uræus, or basilisk, with the disk. (R. S. P.)

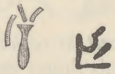
[7] The sense of this character is rather "child" than "son," but it is certainly employed in the latter signification. (R. S. P.)

[8] This is near the signification, which, however, has not been precisely defined. The symbol above the arm is a sieve, standing for the sound SH, and the object held in the hand is a flail.

[9] This group reads SUTEN-SHEBT, "king of Upper and Lower Egypt;" the title "King of Upper Egypt" being denoted by the abbreviation ST, the reed and semicircle, and the title "King of Lower Egypt," by the symbolic sign, a "bee" or "wasp," and semicircle. (R. S. P.)

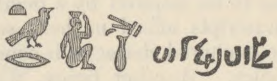
Horapollo tells us that a bee signified a people obedient to a king; hence this symbol might be interpreted *king of men.* Ammianus Marcellinus, however, asserts, more simply, that a king was denoted by a bee. It appears from the manuscripts that the beginning of the enchorial character, which Mr Akerblad read PHU, is derived from the elementary traces representing the reed, the semicircle, a waved line, and a sitting deity, meaning *the divine king;* an assemblage which often occurs on the green sarcophagus, and elsewhere, as applied to a royal person. The remainder of the enchorial character seems to represent a termination consisting of a semicircle and a vessel, which is often added to a name, apparently as a demonstration of respect, like the vessel and the spiral in the case of the god Nilus (No. 19).

138. CONDITION.
ⲙⲉⲧ . . .



138. CONDITION, or subjection, is denoted by a character which somewhat resembles an altar with an offering of flowers, but which might also be intended for the cup of a flower with an insect hovering over it.

139. KINGDOM.
ⲙⲉⲧⲟⲩⲣⲟ

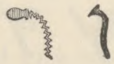


139. In the term KINGDOM, the crown is figuratively employed for its wearer; a metaphor common in many modern languages.

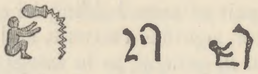
140. LIBATION.
ⲱⲧⲉⲛ ⲉ̀ⲃⲟⲗ

140. The character denoting a LIBATION is very indistinctly traced in the sacred inscription of Rosetta, so that it would have been impossible to explain its original form without the assistance of other hieroglyphical monuments.[1] The long water-jar, out of which the kneeling figure is pouring a divided stream, somewhat resembles those which a modern Egyptian woman is seen carrying in a plate of Mr Legh's second edition.

141. CEREMONY.
ϣⲗⲏⲗ?



142. PRIEST.
ⲟⲩⲏⲃ, ϩⲟⲛⲧ

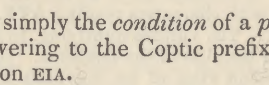


141, 142. The vase with the stream, which frequently occurs in the character for PRIEST, is sometimes found alone, and must therefore probably relate to some particular CEREMONY performed by the priests, approaching to the nature of a libation. On the Stone of Rosetta the line is a simple curve, not waved; nor is the vase more distinctly represented. Instead of the sitting figure, a foot is sometimes substituted, as in the word *attendant* (No. 130); and the enchorial character is a more tolerable approximation to this form than to the complete figure.

143. PRIESTHOOD.
ⲙⲉⲧⲟⲩⲏⲃ

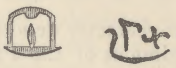
143. PRIESTHOOD is simply the *condition* of a *priest;* the character prefixed answering to the Coptic prefix MET, and to the Greek termination EIA.

144. SACERDOTAL.
ⲛⲧⲉ ⲛⲓϩⲟⲛⲧ



144. The ornaments of the head are very generally used as indicating the person by whom they are worn; and flowers, probably those of the lotus, are frequently found on the heads of the priests, as well as in the inscriptions which accompany them. In the inscription of Rosetta the sense SACERDOTAL agrees very well with the context where this character occurs, though it cannot be deduced with absolute certainty from the comparison with the Greek.[2]

145. ASSEMBLY.
ϣⲁⲓ

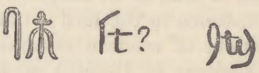


145. It is by no means easy to explain why the figure like a buckle should clearly mean an ASSEMBLY.[3] Perhaps, however, the upper part may originally have been a crescent, implying monthly; and the scale or basin below is occasionally found supporting some offerings, which are set upright in it; so that the whole may have meant *a monthly exhibition.*

146. SACRED.
ⲟⲩⲁⲃ

146. The character *god* is made an adjective by the addition of the waved line, and of the long drop, which seem simply to convert it into the term SACRED; or, if the drop has any other meaning, it can only relate to worshipping or honouring, as the character prefixed in the enchorial text, which is equivalent to the scale or basin, is elsewhere employed to signify *honour* or *attention.*[4] In some other instances, a circle and a waved line seem to be employed in a similar manner, for connecting one character with another like substantive and adjective.

147. CONSECRATED.
ⲑⲟⲩⲱⲧ



147. An epithet implying CONSECRATED or dedicated is composed of a trident, or triple branch or root, followed by a bent line. It occurs very commonly near the beginning of inscriptions, on obelisks, and elsewhere.[5]

148. GIVE.
ϯ

148. A little oblique cross, over an arm with a feather, seems to mean to GIVE, and perhaps to fight and to defend, as, in Coptic, the word TI has both these senses. It is often preceded by a circle and a semicircle.

149. OFFER.
ⲉⲛ, ⲓⲛⲓ

149. The hand bearing the triangle or pyramid (No. 111), manifestly means, in the friezes of Montagu and Ficoroni, to OFFER, as an oblation to a deity.[6]

150. DEDICATE.
ⲧⲁϩⲟ

---

[1] The first character means primarily a "pure person," and then a "priest;" and the characters under Nos. 141, 142, have the same signification. (R. S. P.)

[2] This hieroglyphic stands for the letter H, in the passage referred to. (R. S. P.)

[3] See section i., *supra.* (R. S. P.)

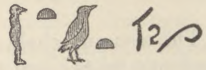
[4] This group is part of the expression "of sacred words" in the Rosetta Stone. It is imperfect in consequence of the omission of the three lines, indicating the plural, after the tongue, not drop. (R. S. P.)

[5] These hieroglyphics form a syllabic group, reading MES, "born," as in the royal name Tetmes, commonly called Thothmes, and the like. (R. S. P.)

[6] The hand bearing a pyramidion or triangle signifies to "give," or "offer." (R. S. P.)

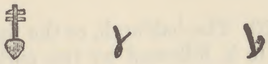
150. In the inscription of Rosetta, we find the word DEDICATE expressed by a bent line and a sitting figure, with the circle, and the arm holding the rudder (No. 134); the character already interpreted *consecrated*, precedes, but it is not absolutely certain that it belongs to the same phrase.

151. LAWFUL.
ⲑⲙⲏⲓ



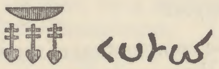
151. The term LAWFUL is naturally enough derived from a deity in his judicial capacity; the figure is preceded by a bird, placed between two semicircles, which must here mean *according to*, answering to the termination *ful*.[1] Sometimes a curved line, supported by a stem, is substituted as a synonym for the figure of the judge.

152. GOOD.
ⲛⲁⲛⲉ



153. BESTOWING.
ⲉⲧϯⲛ̀ϩⲙⲟⲧ

154. MUNIFICENT.
ⲣⲉϥⲛⲁⲛⲉϥ



152–154. The character representing GOOD strongly resembles the figure of a lute, depicted in the chamber of the harps, among the catacombs, and may have alluded to the pleasing sound of music. The plural, with the scale or basin, which implies BESTOWING, makes the epithet EUCHARISTUS, which in Greek is somewhat ambiguous, meaning either grateful or MUNIFICENT. The latter, however, must be its sense in this inscription, because *good gifts* or *delights* may be plural, but *gratitude* not so easily.[2] The lute is also found denoting good in other parts of the inscription. The enchorial character for the scale could scarcely have been suspected to be derived from it, without the assistance of the manuscripts, which constantly exhibit an intermediate form, intended, perhaps, to comprehend one of the lines supporting the scale.

155. GREAT.
ⲛⲓϣϯ, ⲛⲁⲁ

155. The semicircle, with two oblique dashes, seems to mean GREAT in the name of Thoth, who is called, in the Greek inscription of Rosetta, Hermes the *great and great;* while, in other places, this character seems almost always to convey the sense of a dual. The enchorial epithet of Thoth is a little like the crown with two semicircles, which is most frequently found among the titles of Osiris, especially when he sits in judgment.[3]

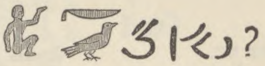
155*. UPPER and LOWER.

155*. The two kinds of hats, worn by the different deities, seem to be intended by the characters of the Rosetta Stone which express the UPPER and LOWER regions or countries. These two characters are also found together in the green sarcophagus as the names of two goddesses; and they occur together in one or two passages of some of the manuscripts, and in an inscription at Philæ, so that, although the representation is very indistinct in the particular case of the Rosetta Stone, there is little doubt that the cap of Osiris meant, in this case, *superior*, and that of Hyperion and other personages *inferior*.

156. OTHERS.
ⲕⲉϫⲱⲟⲩⲛⲓ

156. A circle and a semicircle stand, in several passages of the inscription of Rosetta, for OTHERS, or remaining.

157. CALLED.
ⲉⲧϫⲱ



157. Possibly the bowl and the bird together mean *say* or *call*, and the figure of a man may serve to make the passive CALLED.

158. DECLARATION.
ⲱϣ, ϩⲱⲡ

158. The second bowl, substituted for the bird, does not appear very essentially to alter the sense, which is still a thing *said* or proclaimed, a DECLARATION, or a decree.

159. MANIFEST.
ⲉⲧⲥⲟⲩⲉⲛ

159. The characters denoting MANIFEST seem to have some analogy to *called*, though their derivation is obscure. The first character may either be intended for the country (No. 84), or for a kind of flag or banner

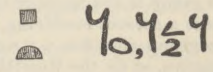
160. NAME.
ⲣⲁⲛ

160. The ring, which implies a NAME, and which elsewhere distinguishes proper names, seems to be an imitation of the label, called a "phylactery" in the Greek inscription of Rosetta, on which the name of a figure was usually distinguished.[4]

161. ENLIGHTENING.
ⲣⲉϥⲉⲣⲟⲩⲱⲓⲛⲓ

161. A disc, with rays descending from it, is one of the few characters in which the form gives us some assistance towards determining the sense, which is found to be ENLIGHTENING;[5] though the Egyptians do not seem to have been very correct in their delineation of the motion of light, which they make to diverge in curved lines, like those described by a common projectile. (See Nos. 8, 63.)

162. LOVING.
ⲙⲁⲓ, ⲙⲉⲛⲣⲏⲧ



162. The square block, the semicircle, and the chain,

---

[1] This hieroglyphic group signifies a "statue," also a "ceremony." (R. S. P.)

[2] The lute is "good" (NUFR), the basin (NEB), "lord," and "all:" the thrice-repeated lute is not a plural in the group given in the woodcut, but a kind of superlative, and the whole reads "thrice good," or "very good, lord." (R. S. P.)

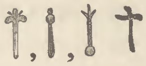
[3] The semicircle and two inclined lines signify twice, as in the epithet of Thoth, "twice great," where it follows the sceptre, meaning "great." We have shown in the present essay, that the Egyptians had no dual. The second group from the left, in the woodcut, means "foreign country." (R. S. P.)

[4] This sign is the determinative of the word REN, "name," and within it were inclosed royal names. (R. S. P.)

[5] This character is a generic determinative of words signifying "light," and the like. (R. S. P.)

are employed very clearly in the sense of LOVING or beloved; the Coptic MAI.[1] In the enchorial character the square and semicircle seem to be sometimes transposed, and sometimes changed into an oval.

163. PRESERVER.
ⲉⲑⲛⲟϩⲉⲙ



163. PRESERVER, or saviour is represented by a sort of trefoil, with a long stem, which answers to a cross or obelisk in the enchorial text; but, in other passages, the character takes the form of a still simpler club; and in others, again, it has something like a bulbous root.

164. SET UP.
ⲧⲁϩⲟ ⲉ̀ⲣⲁⲧ

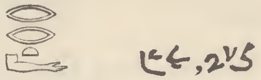
165. PREPARE.
ⲥⲉⲃⲧⲉ

164, 165. A frame like a ladder, supported by a stem, occurs sometimes as a part of a head-dress, but it is difficult to say if it represents any other object. Followed by an arm, and a pair of legs, it signifies SET UP, and this combination of characters is of very frequent occurrence;[2] sometimes also the bent line or divided shaft forms a part of it. In Coptic, *set up* is expressed by *set on foot*, which seems to retain the analogy of the hieroglyphical character. The substitution of a pair of feathers for the legs, however, does not appear materially to alter the sense; the context, where it occurs, requiring the word PREPARE or construct.[3]

Relations.

G. *Relations.*

166. IN ORDER THAT.
ϩⲓⲛⲁ

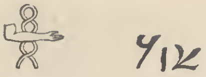


166. Two ovals, with a semicircle and an arm, very clearly signify IN ORDER THAT. The ovals seem to mean to or *for*, and the arm action or *doing*, as our own *that* seems to be allied to the German *that*, which means *deed*. The same combination of characters appears to denote in another passage *to add to;* and one of the ovals is sometimes omitted.[4] The Coptic may be either HINA or ETHBE.

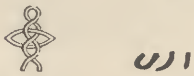
167. WHEREVER.
ⲡⲓⲙⲁ.ⲉⲟⲩⲙⲁ

167. The symbols employed in the sense WHEREVER seem to mean separately *at*, *in*, *one*, or *in*, *place*, *one*;[5] and, transposing the two last, we may make a very good Coptic word E-U-MA.

168. AND.
ⲟⲩⲟϩ



169. ALSO, WITH.
ⲛⲉⲙ

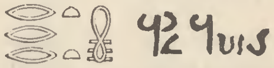


168, 169. The arm and chain signify AND or ALSO; and the oval sometimes takes place of the arm, without much variation of the sense: this combination is also found in the sense of *with*, or *together with*. The elementary ideas seem to be *put*, *with*, or *add*, *with*.[6] Between the names of Ptolemy and Berenice at Karnak the arm and chain are separate.

170. MOREOVER.
ⲛϩⲟⲩⲟ

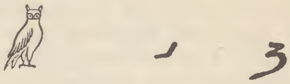
170. The half arch, or the fork, which is perfectly equivalent to it, followed by two curls and two semicircles, mean MOREOVER;[7] the reduplication probably resembling that of many of the Coptic verbs, which generally imply a continued action.

171. LIKEWISE.
ⲙⲡⲁⲓⲣⲏϯ



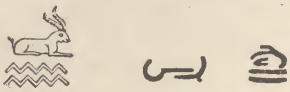
171. The combination of the loop or sling with two semicircles and three ovals means very clearly LIKEWISE. The loop seems to represent a bucket, intended for one of a pair, to be carried on a pole, as they are frequently delineated in the tablets; so that it must mean a *companion;* and accordingly we find it in a very common epithet of a king, on obelisks and elsewhere, with a circle and a bar, denoting *the companion of the sun*, or simply *resembling the sun*.[8] In the enchorial character for *likewise* the symbols seem to be transposed, and the loop is doubled.

172. IN.
ϧⲉⲛ, ⲉϩⲟⲩⲛ

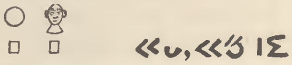


172. An owl, signifying IN, seems to be nearly synonymous with the half arch, which is also sometimes to be understood in the sense of *all*. Both these characters occur also in many instances where they can only be considered as marks of respect, and not very essential to the sense; and in this they resemble the Coptic prefix M, which is a particle not very distinctly intelligible, nor capable of being translated. It is also not a little remarkable, that the M of Akerblad's alphabet is the enchorial character which answers to both of these symbols.[9] (See No. 123.)

173. UPON, AT.
ϩⲓ, ⲉϩⲣⲏⲓ



174. OVER, ON.
ⲉϫⲱ



---

[1] This group is the name of the Egyptian Vulcan, PTEH, commonly called Ptah, or Phthah. (R. S. P.)

[2] This is a correct rendering, but the legs are a determinative of motion or its results. (R. S. P.)

[3] This group signifies a "stele" or "tablet," *i.e.*, "a thing set up." It should be followed by the representation of a tablet, as a determinative, as on the Rosetta Stone. (R. S. P.)

[4] This group, with one "oval," is rightly rendered "in order that." (R. S. P.)

[5] This group reads ERMA, and means literally "towards the place," and thence "where." (R. S. P.)

[6] Both these groups, reading respectively HA and HER, signify "and, also;" but it must not be concluded that they are identical on the principle of the omission of the final R mentioned in the subsequent sketch of grammar (section iii.), for the vowel is one that is probably long or guttural, and not like that elided before R. (R. S. P.)

[7] These groups both signify "equally, likewise." (R. S. P.)

[8] The sign here called a loop or sling, signifies "like, as," SHA, and is usually written with the reed (A) as a complement: with the two semicircles it means "similarly." The group mentioned here as this sign, with the circle (disk) and bar (masculine sign), means "resembling the sun, like the sun." (R. S. P.)

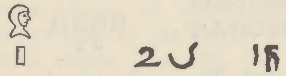
[9] The hieroglyphic character and second enchorial character are the same, and stand for the letter M, frequently employed for the preposition mentioned in the text. The first enchorial character corresponds to a usual form of the chicken U, but may represent the owl in carelessly written manuscripts. (R. S. P.)

173, 174. A hare over two waved lines is employed, either alone or together with a head, dash, circle, and dash, which have separately a similar sense for UPON, OVER, or *at*;[1] and it is remarkable that a similar relation exists in Coptic between EHREÏ and EJO, JO, or DCHO, also meaning a head. The enchorial character, in some of its forms, is manifestly a coarse imitation of an animal. The head is always represented in the manuscripts by a character nearly like a Greek Σ; and this may possibly have been the origin of the Coptic letter JANJIA, if it was derived from a hieroglyphic; but it is equally probable that it may have been intended for a combination of a *delta* and a *chi*.[2]

175. FOR.
ϣⲁ

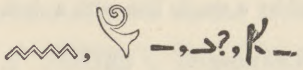
175. A semicircle and an oval mean FOR, as relating to time.[3]

176. BY THE.
(ⲕⲁⲧⲁ),ⲛⲧⲉ?



176. A ball, with two short appendages, one narrower than the other, occurs several times on the Rosetta Stone, and seems to have been intended for a head seen in profile, which is often found on other monuments. This character, together with a dash, seems to signify BY THE, or *each;* for instance *every* year, or *every* month.[4]

177. OF, TO.
ⲚⲦⲈ,Ⲛ

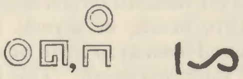


177. The hat, interposed between "an image" and "the king," can only mean OF, or FOR. It is often substituted, in passages which are frequently repeated, for the waved line, each being probably equivalent to the Coptic NTE, or rather N;[5] which also sometimes makes an adjective of a substantive, as NNUB, golden, from NUB, gold. (See Nos. 58, 83, 140.)

Time.

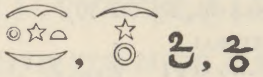
H. *Time.*

178. DAY.
ⲉϩⲟⲟⲩ.ⲙⲉⲣⲓ



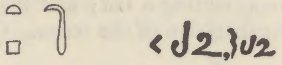
178. A DAY seems to be very naturally expressed by *splendour* of the *sun*, or sunshine.[6] (See Nos. 119, 8.)

179. MONTH.
ⲁⲃⲟⲧ



179. A crescent turned downwards, with a star and the sun, makes up the character signifying a MONTH; to which a semicircle and a scale or basin are sometimes added.[7] Horapollo says that a month is denoted by a palm branch, or by an inverted crescent; but the crescent is too indistinct on the Stone of Rosetta to have allowed us to recognise it without the assistance of the collateral inscriptions.

180. YEAR.
ⲣⲟⲙⲡⲓ

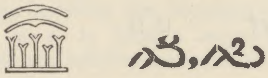


180. A YEAR is denoted by a bent line with a little projection from the middle, which seems to represent a plant with an annual shoot or bud; it is commonly followed by a semicircle and a block or dash.[8]

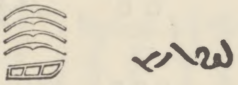
181. THOUTH.
ⲑⲱⲟⲩⲧ

181. There is some little uncertainty respecting the exact limits of the characters denoting the first month, THOYTH. The name seems to have some relation to gathering the harvest, and the emblem is probably intended for a field of corn; and, perhaps, as the year is said to have begun originally with the dog-days, the appropriation of this character to the first month may have been contemporaneous with the origin of the calendar.[9]

182. MECHIR.
ⲙⲉⲭⲓⲣ



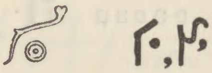
183. MESORE.
ⲙⲉⲥⲱⲣⲏ



182, 183. The sixth month, MECHIR, is remarkable for having half as many crescents as the twelfth, MESORE.[10] This relation would without doubt be further illustrated if we could discover anything like a calendar among the immense mass of Egyptian literature which is still in existence. The manuscript which Montfaucon calls a calendar, merely because it is divided into twelve columns, has no pretensions to the name.

184. FIRST DAY.
ⲥⲟⲩⲁⲓ

185. THIRTIETH.
ⲥⲟⲩ ⲙⲁⲡ



184, 185. The symbol for the sun seems to be employed in the designation both of the FIRST DAY of the month, the NEOMENIA of the Greek inscription, and of the last, or THIRTIETH DAY.[11] Of the characters following the sun, the one seems to mean good, or rather *new*, as in Thoyth, the month of the new year; the other *old* or *last*. This character might be taken for a serpent, or for a branch of a tree; but it seems more probable that it is intended for the *tail* of an animal, since it occurs in several passages of the manuscripts as representing a tail; and the tail of the month is sufficiently expressive of the sense. (See No. 130.)

---

[1] The hare and two waved lines, UNN, represent the substantive verb "to be," but the second N does not occur except in its participle present. The next group is wrongly represented, the circle being a false copy of a head in profile. It is a compound preposition, "above," lit. "on," or "over, the head." (R. S. P.)

[2] This Coptic letter is derived in its form from the hieratic representation of the crocodile's tail, a hieroglyphic sign for K. (R. S. P.)

[3] This group, followed by the palm-branch, determinative of the year and seasons, signifies a "season, time." (R. S. P.)

[4] The character for "each" is a kind of loop, and has no relation to the head in profile, which, when alone, signifies "first," &c., and with the straight line or bar, usually a "head," as may be seen by the literal rendering of the compound preposition mentioned in note 1, above. (R. S. P.)

[5] The waved line and crown of Lower Egypt, are here rightly held to be homophones. They represent the preposition EN or N, "of," &c. (R. S. P.)

[6] The first character is alphabetic (H) or syllabic, the second, a determinative, in the first group; the second group is inaccurately given. The whole word for day is HAU. (R. S. P.)

[7] Both these characters are used for month in the Rosetta Stone. (R. S. P.)

[8] The first sign of this group is a palm-branch, and should have a notch in the middle of the outer side. The third is usually the disk, though the square occurs in its place. (R. S. P.)

[9] The dagger stands for "first" in this group, "month" is understood, and the second hieroglyphic is the sign of the first season of the Egyptian year. Into the original character of these seasons, as indicated by the signs representing them in the hieroglyphic writing, we have not space here to enter. (R. S. P.)

[10] This group is the name of the second month, the two crescents here meaning "second month" of the first season, or Paopi. (R. S. P.)

[11] The signs rendered "first day," mean "last day," which is equally the signification of the group rendered "thirtieth day." The character usually translated "good," properly signifies "perfect;" hence perfect in form, "beautiful," perfect in character, "good," perfect in time, "complete," and thence "last." (R. S. P.)

Numbers.

I. *Numbers.*

186. ONE.
ⲟⲩⲁⲓ, ⲟⲩⲓ

186. UNITS are denoted by short lines, like the Roman I. Mr Akerblad first noticed the first three numerals in the last line of the sacred characters of Rosetta, where the Greek text is deficient, and the words "first and second" only remain; and this observation alone was sufficient to prove that the hieroglyphical characters related to a real language, and were not simply ornamental decorations, as some persons have imagined.

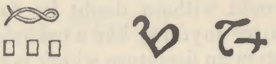
187. FIRST.
ϩⲟⲩⲓⲧ

188. TWO.
ⲥⲛⲁⲩ, ⲥⲛⲟⲩϯ

189. SECOND.
ⲙⲁϩⲥⲛⲁⲩ

190. THREE.
ϣⲟⲙⲧ

191. THIRD.
ⲙⲁϩ ϣⲟⲙⲧ



192. THRICE.
ϣⲟⲙⲧ ⲛⲥⲟⲡ

193. FOUR.
ϥⲧⲟ

194. FIVE.
ϯⲟⲩ

195. SEVEN.
ϣⲁϣϥ

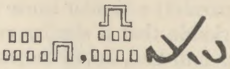
196. EIGHTH.
ⲙⲁϩϣⲙⲏⲛ

187–196. The twisted line distinguishing the ORDINAL NUMBERS answers to the Coptic MAH, which is prefixed to the cardinals in the same sense: in the enchorial text the corresponding character follows the number. The THREE points are more commonly employed when they follow a word, to make it plural; but when they signify a numeral they are generally placed immediately above some other character; and in the enchorial inscription this numeral is distinguished by making the lines oblique and joining them.

197. TEN.
ⲙⲏⲧ, ⲙⲏϯ

197. For the number TEN we have a Greek *pi*, either square or rounded, not only in the inscription of Rosetta, but in many other places.

198. SEVENTEEN.
ⲙⲉⲧϣⲁϣϥ



198. We find the number SEVENTEEN occurring twice as a date in the inscription of Rosetta; the Greek text, in another part, alluding to the same period, has *eighteen;* and the enchorial words are too indistinctly marked to allow us to judge of the identity or diversity of the two numbers; but the difference of a day is of no consequence, since the festival of the "assumption of the kingdom" may easily have begun on the 17th of Mechir, and continued to the next day, which is the date of the decree.

199. THIRTY.
ⲙⲁⲃ

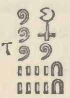
200. FORTY-TWO.
ϩⲙⲉⲥⲛⲁⲩ

199, 200. The enchorial character for THIRTY, applied to years, seems to be the same as is elsewhere used in the sense of the *thirtieth day;* but the numbers are almost always confused in the running hand, and exhibit several deviations from the regular system of the sacred characters. The number FORTY, for example, in the remarkable passage relating to the forty-two assessors of Osiris, seems to be denoted by a single line with a dash on it.

201. A HUNDRED.
ϣⲉ

202. A THOUSAND.
ϣⲟ

203. MCDXXVIII.
ϣⲟ ϥⲧⲟ ϣⲉ ϫⲱⲧ ϣⲙⲟⲩⲛ



201–203. The curl, like the figure 9, meaning A HUNDRED, and the notched circle, supported by a cross, denoting A THOUSAND, occur, in several inscriptions, so combined with units and tens, as to leave no doubt respecting the numbers that they represent. This is particularly evident from the consideration of an inscription "believed to have been found at Karnak"[1] (*Déscription de l'Egypte, Antiq.*, tom. iii., pl. xxxviii., fig. 26–30).

204. SEVERAL.
ϩⲁⲛ . . . ⲟⲩⲓ

204. PLURALS are distinguished by writing a character three times, or by putting three dashes after it, and sometimes, perhaps, though very rarely, before it; occasionally also, by repeating a part of a collection of symbols once only. In the manuscripts, the three dashes are generally joined into a crooked stroke, which, in the enchorial inscription, sometimes both precedes and follows the word; while, in other cases, the second stroke is converted into a single vertical line, which serves to limit the extent of the characters meant to be made plural; the representation being so imperfect, that this assistance is more required than in the sacred characters.[2] And it may be observed, that this second mark is never wanting in the enchorial inscription, as it must frequently have been if the character had been alphabetical; since many of the Egyptian plurals end precisely as their singulars do, and even when they differ from them, it is not by the addition of any one uniform termination.

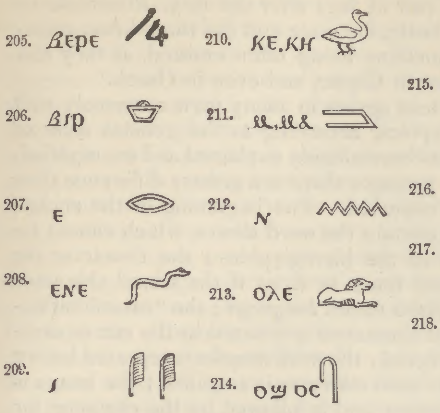
---

[1] All these renderings of numerals are correct, excepting that of No. 192, where the second character does not produce the signification "thrice." (R. S. P.)

[2] This account of the modes of writing the plural is nearly accurate. It will, however, be seen in the subsequent grammatical sketch, that the signs almost always represent the sound U, unless a sign for that sound is given with them. (R. S. P.)

Hieroglyphics. Sounds.

K. *Sounds.*



205–218. The *phonetic characters*, according to the traces which may be discovered in the words *Berenice*, *Ptolemy*, *Greek*, and some others (Nos. 56, 58, 74, 83, 123, 172), will afford something like a hieroglyphic alphabet, which, however, is merely collected as a specimen of the mode of expressing sounds in some particular cases, and not as having been universally employed where sounds were required.[1]

The Supposed Enchorial Alphabet which is subjoined is applicable to most of the proper names in the inscription of Rosetta, and probably also to some other symbols which have been the prototypes of the characters. It is taken from the alphabet of Akerblad, but considerably modified by the conjectures which have been published in the *Museum Criticum*.[2]

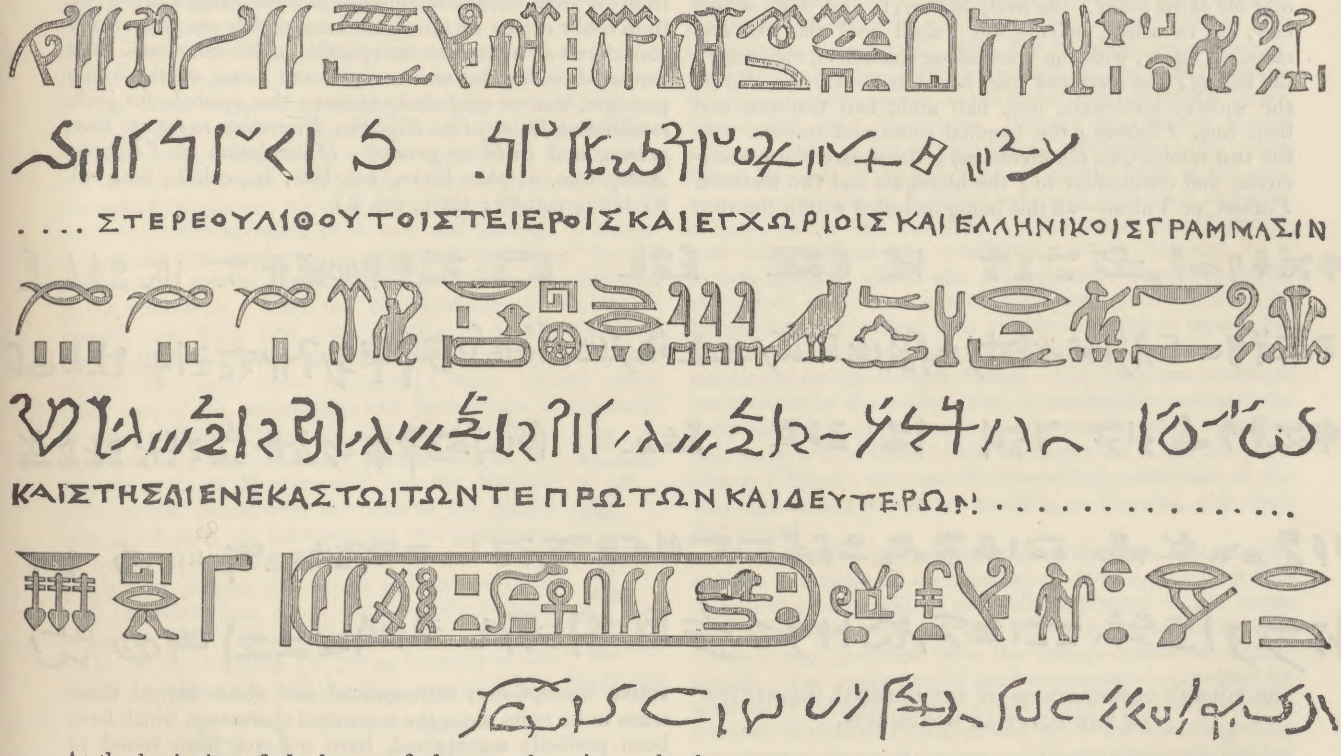
M. *Specimens of Phrases.*[3]

Specimens of phrases.

The last line of the inscription of Rosetta will serve as a specimen of the way in which the hieroglyphical characters were combined, so as to form a language; and will show at the same time the relation between the sacred and the enchorial texts.



. . . . ΣΤΕΡΕΟΥΛΙΘΟΥ ΤΟΙΣΤΕΙΕΡΟΙΣ ΚΑΙ ΕΓΧΩΡΙΟΙΣ ΚΑΙ ΕΛΛΗΝΙΚΟΙΣ ΓΡΑΜΜΑΣΙΝ
ΚΑΙΣΤΗΣΑΙ ΕΝΕΚΑΣΤΩΙ ΤΩΝ ΤΕ ΠΡΩΤΩΝ ΚΑΙ ΔΕΥΤΕΡΩΝ . . . .

At the beginning of the line we find some obscurity, and a want of perfect correspondence in the two inscriptions; but it is clear that the fork or ladder, the arm and the feathers, mean to *prepare* or procure; then follows *a column;* the wavy line, *of;* the semicircle and two dashes, with the arm, probably *strong* or hard; the block or square below, with its semicircle, *stone;* the loop or knot *wrought* or engraven; the half arch *in* or with; the instrument or case, *writing,* or letters; the wavy line, the hatchet, and drop, with the three dashes making a plural, *appropriate to the gods,* that is, sacred; the case again, *letters;* the hat, *of;* the ladder, arm, and feathers, *the country;* the serpent and bent line, approaching to the sense of perpetuity and greatness, seem to be a mark of respect to the country, though it is barely possible that they may be substituted for the repetition of the instrument or case, and may mean the language, and belong to the following curl on the stem, the feathers, the serpent, and the hat, which signify *Greek.* The head-dress of flowers meaning probably a priest, the following curl with the dashes, probably ornamental or honorary, or perhaps collective, and the two bowls, with the man in the plural, a publication,—the whole of these symbols must express *the honorary decree of the priests, or the decree of the assembled priests;* but the enchorial text seems to include the symbol for honour. The oval, with the semicircle and arm, implies, in order that, or, *in order to;* the fork with cross bars, the arm, the legs, and the snake, *set it up;* the bird, *in;* the three broad feathers over as many open squares, *the temples,* as a plural; the half arch and oval with the plural dashes, *all,* or *of all kinds;* the open square, wheel, scale, head, dash, and ring, *Egypt;* the figure with a vase on his head, *subjection* or *power;* making the whole, *belonging to Egypt,* or *throughout Egypt;* the fork and dash are *in,* or *in all;* the knots or chains, followed by the numbers, *of the first, the second, and the third order;* the oval, half arch, and dash, *wherever,* or *in which,* leaving out "shall be;" the tool and standing figure, with the intervening characters, *the image;* the hat, *of;* the reed and bee, with the semicircles, *King;* the square, semicircle, lion, half arch, two feathers, and bent line, *Ptolemy;* the handled cross and serpent with the two semicircles, *the everliving;* the square block, semicircle, and chain, *dear to;* the hieralpha and two feathers, *Phthah,* or Vulcan—all this being included within the ring or phylactery, together with the name; the open square, the oval, and the pair of legs after the ring, *illustrious* or Epiphanes; and lastly, the scale and the three lutes, *munificent;* the conjunctions being often omitted, as they also very commonly are in Coptic, and even in Greek.[1]

---

[1] Of this alphabet, beginning from the left, the first group in the first column is composed of the demotic signs for BR in Berenice, and is out of place here, the second is simply B, the third R, the fourth T, and the last is correctly rendered; the first character in the second column should be the eagle A, the second is M, the third is rightly rendered, the fourth is R, and the last S; and in the third column the last character alone is wrong, for it should be SH. (R. S. P.)

[2] A comparison of this enchorial alphabet, with the latest results of research into these characters, cannot fail to awaken our admiration for the sagacity and judgment of Dr Young. In Brugsch's list of the alphabetic signs, we find a remarkable agreement, and Dr Young's renderings of letters are in few cases wholly wrong. Comp. *Gram. Dém.*, p. 18. (R. S. P.)

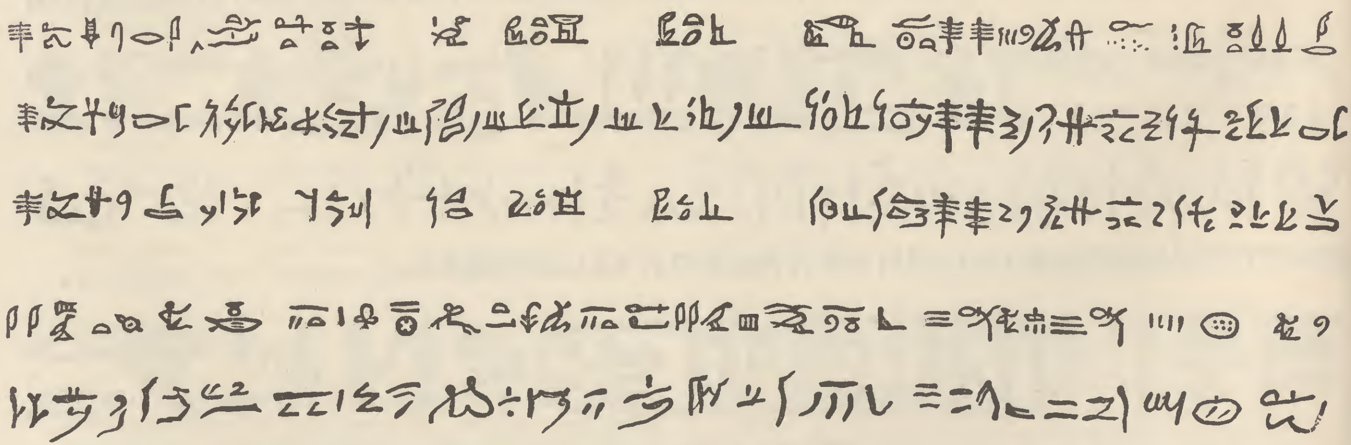
[3] The heading L, here omitted, comprised merely references to additional illustrations now inserted in their proper places. (R. S. P.)

The enchorial text agrees in many parts extremely well with the hieroglyphics, according to the general style of imitation which has been already explained and exemplified, although in some passages there is a greater difference than might have been expected. The beginning of the enchorial line seems to contain the word *decree,* which cannot be found in this part of the hieroglyphics; the character for letters occurs three times in it, as if the sacred character used in the third place meant *language;* the "sacerdotal decree" of the sacred characters is omitted in the corresponding part of the enchorial; the word *temples* is repeated before each numeral; the term *wherever* is amplified; the image is a very coarse imitation, and is followed by the character for a deity, meaning sacred or divine; and, lastly, the name of Ptolemy is omitted, the word king being only followed by "whose life shall be for ever," or a phrase of similar import.

N. *Comparison of Manuscripts.*

Comparison of manuscripts.

The subjoined specimens of a comparison of the different manuscripts, which deviate more or less from the form of distinct hieroglyphics, with others in which those characters are preserved almost entire, though slightly traced, will serve to show the complete identity of the different systems in their original form; the first and fourth lines being taken from the great hieratic manuscript of Strasbourg, and the rest from other copies of the same text, which are universally considered as written in the epistolographic character. We cannot discover the entire connected sense of the whole passages, but we may easily observe the symbols for *gods, established, Osiris, Isis, Nephthe, Hieracion, to set up, four, priests,* and *child* or *prince.*[2] (*Déscription de l'Egypte, Antiq.* tom. ii., plate lxxiv., col. 106; lx., col. 3; lxii., col. 2; lxxii., col. 38; lxvii., col. 2.)



DR YOUNG'S OBSERVATIONS ON THE GENERAL CHARACTER OF THE EGYPTIAN MONUMENTS.

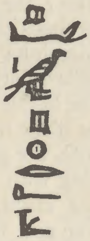
Observations on the Egyptian monuments.

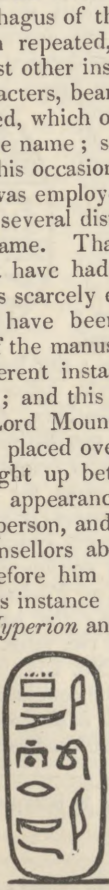
By means of the knowledge of the hieroglyphic characters which has already been obtained, we are fully competent to form a general idea of the nature of the inscriptions on the principal Egyptian monuments that are extant. Numerous as they are, there is scarcely one of them which we are not able to refer to the class either of sepulchral or of votive inscriptions; astronomical and chronological there seem to be none, since the numerical characters, which have been perfectly ascertained, have not yet been found to occur in such a form as they necessarily must have assumed in the records of this description. Of an historical nature we can only find the triumphal, which are often sufficiently distinguishable, but they also may always be referred to the votive; since whoever related his own exploits thought it wisest to attribute the glory of them to some deity, and whoever recorded those of another was generally disposed to intermix divine honours with his panegyric. It has, indeed, been asserted that the Egyptians were not in the habit of deifying any mortal persons; but the inscription of Rosetta is by no means the only one in which the sovereigns of Egypt are inserted in the number of its deities. The custom is observable in monuments of a much earlier age; indeed, in such a country it might be considered as a kind of dilemma of degradation, whether it was most ridiculous to be made a divinity, or to be excluded from so plebeian an assemblage; but flattery is more prone to err by commission than by omission, and consequently we find the terms king and god very generally inseparable. The sepulchral inscriptions, from the attention that was paid in Egypt to the obsequies of the dead, appear, upon the whole, to constitute the most considerable part of the Egyptian literature which remains; and they afford us, upon a comparative examination, some very remarkable peculiarities. The general tenor of all these inscriptions appears to be, as might have been expected from the testimony of Herodotus, the identification of the deceased with the god Osiris, and probably, if a female, with Isis;[1] and the subject of the most usual representations seems to be the reception of this new personage by the principal deities, to whom he now stands in a relation expressed in the respective inscriptions; the honour of an apotheosis, reserved by the ancient Romans for emperors, and by the modern for saints, having been apparently extended by the old Egyptians to private individuals of all descriptions. It required an extensive comparison of these inscriptions to recognise their precise nature, since they seldom contain a name surrounded by a ring in its usual form. Sometimes, however, as on the green sarcophagus of the British Museum, a distinct name is very often repeated, and preceded by that of Osiris; while, in most other instances, there is a certain combination of characters, bearing evident relation to the personage delineated, which occurs, after the symbols of Osiris, instead of the name; so that either the ring was simply omitted on this occasion, or a new and perhaps a mysterious name was employed, consisting frequently of the appellations of several distinct deities, and probably analogous to the real name. That the characteristic phrase, so repeated, must have had some relation to the deceased, is proved by its scarcely ever being alike in any two monuments that have been compared; while almost every other part of the manuscripts and inscriptions is the same in many different instances, and some of them in almost all; and this same phrase may be observed in Lord Mountnorris' and Mr Bankes' manuscripts, placed over the head of the person who is brought up between the two goddesses, to make his appearance before the true Osiris, in his own person, and in his judicial capacity, with his counsellors about him, and the balance of justice before him (*Hieroglyphics*, 5 E F G e f). In this instance the phrase consists of the names of *Hyperion* and the *Sun*, preceded by a block and an arm with an offering; and it may be interpreted, without any violence, "the votary of Hyperion and of Phre." In a small manuscript, engraved by Denon, the part which resembles the characteristic phrase of other manuscripts is followed by the name of a king, which is nearly identical with that of the father of the Pseudomemnon in the British Museum; the one having the hieralpha laid flat, the other the traces of the pedestal, which is equivalent to it.

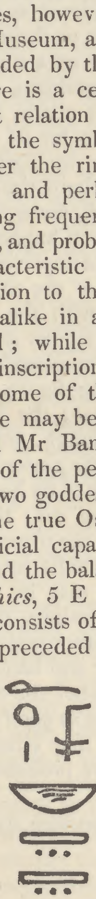
---

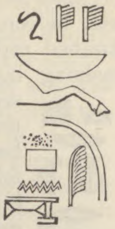
[1] It would occupy too much space to follow Dr Young in this analysis, especially as the Chevalier Bunsen has given an analysis of this extract from the hieroglyphic inscription of the Rosetta Stone (*Egypt's Place,* vol. i., p. 596, *et seqq.*), in accordance with the present state of knowledge. (R. S. P.)

[2] The first extract, given first in linear hieroglyphics, and then in two kinds of hieratic, reads—"[These] are the venerable (?) great [divinities] dwelling in the land of TETTU, Osiris, Isis, Nephthys, Horus, [who] sustains (?) his father. They are placed . ." The second is a mutilated fragment. (R. S. P.)







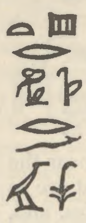


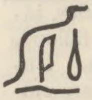
The tablet of the last judgment, which is so well illustrated by the testimony of Diodorus concerning the funerals of the Egyptians, is found near the end of almost all the manuscripts upon papyrus, that are so frequently discovered in the coffins of the mummies, and, among others, in Lord Mountnorris's hieratic manuscript, printed in the Collection of the Egyptian Society. The great deity sits on the left, holding the hook and the whip or fan; his name and titles are generally placed over him; but this part of the present manuscript is a little injured. Before him is a kind of mace, supporting something like the skin of a leopard; then a female Cerberus, and on a shelf over her head the tetrad of Termini, which have already been distinguished by the names Tetrarcha, Anubis, Macedo, and Hieracion, each having had his appropriate denomination written over his head. Behind the Cerberus stands Thoth, with his style and tablet, having just begun to write. Over his head, in two columns, we find his name and titles, including his designation as a scribe. The balance follows, with a little baboon as a kind of genius sitting on it. Under the beam stand Cteristes and Hyperion, who are employed in adjusting the equipoise; but their names in this manuscript are omitted. The five columns over the balance are only remarkable as containing, in this instance, the characteristic phrase, or the name of the deceased, intermixed with other characters. Beyond the balance stands a female, holding the sceptre of Isis, who seems to be called Rhea, the wife of the sun. She is looking back at the personage, who holds up his hand as a mark of respect, and who is identified as the deceased by the name simply placed over him, without any exordium. He is followed by a second goddess, who is also holding up her hands in token of respect, and whose name looks like a personification of honour or glory, unless it is simply intended to signify "a divine priestess" belonging to the order of the Pterophori mentioned on the Rosetta Stone. The forty-two assessors are wanting in this tablet; and, in many other manuscripts, their number is curtailed, to make room for other subjects; but, in several of those which are engraved in the *Déscription de l'Egypte*, they are all represented, sometimes as sitting figures, and sometimes standing as Termini, with their feet united.

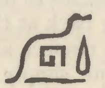
The principal part of the text of all these manuscripts appears to consist of a collection of hymns, or rather homages, to certain deities, generally expressed in the name of the deceased, with his title of Osiris, although the true Osiris is not excluded from the groups which are introduced. The upper part of each manuscript is occupied by a series of pictural tablets; and under them are vertical columns of distinct hieroglyphics, or, in the epistolographic manuscripts, pages of the text, which are commonly divided into paragraphs, with a tablet at the head of each, the first words being constantly written with red ink, made of a kind of ochre, as the black is of a carbonaceous substance. The beginning of the manuscript is seldom entire, being always at the outside of the roll; as the *umbilicus* of the Romans was synonymous with the end. Not far from the beginning, we always find a large tablet, occupying the whole depth of the paper, representing the sun adored by his ministering spirits. In the large hieratic manuscript, which occupies four plates of the *Déscription de l'Egypte*, and which may be considered as a fine specimen of the most highly finished copies, there are at present only four columns remaining before this tablet. It is followed by a short section, with a rubric, which is not very distinctly expressed; after this are thirty-five others, beginning with a long rubric, which is usually followed by the name of a divinity, represented in a neighbouring part of the margin, and which may be supposed to mean something like "Respect and reverence be paid to each of the sacred powers."[1] The next ten sections begin with the rubric of a feather, and a sitting figure raising his hand to his head, as if holding a vase on it, meaning probably "Honour is due,"[2] or belonging to; then follow the name and titles of Thoth or Hermes, and the phrase describing the deceased in the character of Osiris; and afterwards the names of each of a group of deities, represented in the corresponding tablet with an altar and a suppliant before them. These groups are different in the different sections, but they correspond pretty accurately with each other in the various manuscripts; and this hermetic decad is the most constant part of the manuscripts found with the mummies, though a little more extended in some than others (*Hieroglyphics*, 4). After these, we find thirty-five sections, beginning with a drop, a feather, a serpent, and a line; the rubric being immediately followed by the deified name peculiar to the manuscript. This exordium, from the analogy of the term sacred (No. 146), we can have no hesitation in understanding as a derivative of the feather, signifying honour or ornament, and the serpent, signifying perpetuity, and in translating it, "eternal honour,"[3] or respect. A similar sense seems, in other places, to be expressed by the open square or the pyramid instead of the feather; and not uncommonly the hat is substituted for the line, without any variation of the meaning. After these thirty-five sections, we have two others, of which the rubrics are less intelligible, followed by forty-two short ones, which evidently contain the names and titles of as many separate deities, whose figures are commonly represented in the great tablet, near that of Osiris. We may generally observe, among the epithets of each, the term "*from illustrious*" (No. 121); and each section has a second paragraph, beginning with a pair of arms extended, a character which seems occasionally to be used in reference to the equal scales of justice, though on the Stone of Rosetta it appears to signify a kind of temple, so that it may possibly relate to the honours to be paid to these divine judges. With a few additional columns, and with the great tablet of the judgment, the manuscript concludes. It does not contain the figure of the sacred cow, which is the termination of most other manuscripts; nor the agricultural representations, which are frequently found in many of them, especially in that of Lord Mountnorris (*Hieroglyphics*, 3), with the three deities sitting in a grotto under it. The last of these, according to the inscriptions over the two boats, is meant for Arueris, the second apparently for the mother of the sun, and the first for Osiris; and one of the boats carries the steps, which seem to be emblematic of the solar power; the other, the throne or chair of state, which is universally appropriated to Osiris.[4]

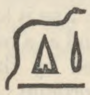
---

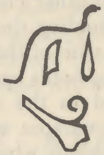
[1] Both males and females, when "justified," received the name of Osiris. (R. S. P.)





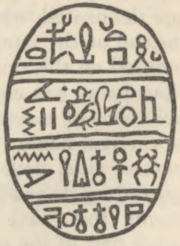






The coffins of the mummies, and the large sarcophagi of stone, are generally covered with representations extremely similar to some of those which are found in the manuscripts. The judicial tablet is frequently delineated on the middle of the coffins; above it are Isis and Nephthe at the sides, and in the middle apparently Rhea with outspread wings. The space below is chiefly occupied by figures of from twenty to thirty of the principal deities, to whom the deceased, in his mystical character, is doing homage; each of them being probably designated by the relationship in which he stands to the new representative of Osiris. In the sculptures, the figures are generally less numerous; the same deities are commonly represented as on the painted coffins, but without the repetition of the suppliant, and in an order subject to some little variation. The large sarcophagus of granite in the British Museum, brought from Cairo, and formerly called the Lover's Fountain, has the name of Apis, as a part of the characteristic denomination.[5] This circumstance, at first sight, seemed to make it evident that it must have been intended to contain the mummy of an Apis, for which its magnitude renders it well calculated; but when the symbols of other deities were found in the mystic names upon various other monuments, this inference could no longer be considered as absolutely conclusive.

Of the votive or dedicatory inscriptions, we find an interesting example on a small scale, in the engraving on the bottom of a scarabæus, very neatly sculptured in a softish steatite, or lapis ollaris, brought from Egypt by Mr Legh. It is remarkable for its simplicity, and for affording an intelligible sense in all its parts. The chain, the semicircle, and the square block, mean clearly [*To*] *the beloved;* the loop supporting a wreath or crown, and the imperfect sitting figure, resemble some of the titles often given to Osiris, and, with the following oval, pretty certainly signify *of the great god;* the throne, the semicircle, and the oval, *Isis;* the sitting figure, *the goddess;* the looped wreath, perhaps *the great;* the bird and circle, *offspring of;* the hieralpha or plough, and the two feathers, *Phthah;* the pillar, perhaps *the powerful*, but it is not distinctly formed; the beetle seems to be here a synonym or epithet of Phthah, as if *the father of all;* the handled cross, *the living;* the lute, *the good;* the pyramid, *the prosperous* or glorious; the ring with the handle seems to be nearly synonymous with the chain, and may be rendered, in conjunction with the line and the hieralpha, *the approved of Phthah*, an epithet found in the inscription of Rosetta; the hatchet is *the deity;* the ring and handle, with the two lutes, approaches near to the symbol for munificent (No. 154), and may be called *delighting in good gifts;* and the concluding ring and staff or hatchet may either mean, *this is dedicated*, or may, with rather more probability, be considered as a reduplica-



---

[1] The meaning of this group is difficult to explain. Mr Birch proposed to the writer PETER-REF-SU, "let it be interpreted to him," comparing the first word with the Hebrew. (R. S. P.)

[2] This group signifies "O!" and commences invocations. (R. S. P.)

[3] This group signifies "speech of." (R. S. P.)

[4] On the Ritual see the preface of Lepsius to his valuable edition (*Das Todtenbuch der Ægypter*), and Bunsen, *Egypt's Place*, vol. i., p. 25, *et seqq.* The contents are prayers to be said by the deceased during his journeys in the other world, and descriptions of these journeys. (R. S. P.)

[5] The name of Apis enters into the composition of that of the person for whom this sarcophagus was made, Hapeemen, as already mentioned. (R. S. P.)

tion of the beginning of the line, in an inverted position.[1] It may be remarked, that all the inscriptions on the scarabæi run from right to left, as is most commonly observed wherever the direction was indifferent; so that if they were used as seals, the impression must have assumed the form which is somewhat less usual in other cases.

We have a most valuable example of a dedicatory inscription on a larger scale in the decree preserved on the Stone of Rosetta, which, besides its utility in affording the only existing clue for deciphering the hieroglyphical characters, gives us also a very complete idea of the general style of the records of the Egyptian hierarchy. Of the triumphal monuments the most magnificent are the obelisks, which are reported by Pliny to have been dedicated to the sun; and there is every reason to suppose that the translation of one of these inscriptions, preserved by Ammianus Marcellinus, after Hermapion, contains a true representation of a part of its contents, more especially as "the mighty Apollo" of Hermapion agrees completely with the hawk, the bull, and the arm, which usually occupy the beginning of each inscription. These symbols are generally followed by a number of pompous titles, not always very intimately connected with each other, and among them we often find that of "Lord of the asp-bearing diadems," with some others immediately preceding the name and parentage of the sovereign who is the principal subject of the inscription. The obelisk at Heliopolis is without the bull; and the whole inscription may be supposed to have signified something of this kind: "This Apollinean trophy is consecrated to the honour of King Ramesses, crowned with an asp-bearing diadem; it is consecrated to the honour of the son of Heron, the ornament of his country, beloved by Phthah, living for ever; it is consecrated to the honour of the revered and beneficent deity Ramesses, great in glory, superior to his enemies; by the decree of an assembly, to the powerful and flourishing, whose life shall be without end." It is true that some parts of this interpretation are in great measure conjectural; but none of it is altogether arbitrary, or unsupported by some probable analogy; and the spirit and tenor of the inscription are probably unimpaired by the alterations which this approximation to the sense may unavoidably have introduced.

Of the obelisks still in existence, there are perhaps about thirty larger and smaller, which may be considered as genuine. Several others are decidedly spurious, having been chiefly sculptured at Rome in imitation of the Egyptian style, but so negligently and unskilfully as to exhibit a striking difference even in the character of the workmanship. Such are the Pamphilian, in explanation of which the laborious Kircher has published a folio volume, and the Barberinian or Veranian. In both of these the emblems are put together in a manner wholly arbitrary; and where an attempt is made to imitate the appearance of a name, the characters are completely different at each repetition. The Sallustian obelisk has also been broken, and joined inaccurately, and some modern restitutions have been very awkwardly introduced, as becomes evident upon comparing with each other the figures of Kircher and of Zoega. Another very celebrated monument, the Isiac table, which has been the subject of much profound discussion, and has given birth to many refined mythological speculations, is equally incapable of supporting a minute examination upon solid grounds; for the inscriptions neither bear any relation to the figures near which they are placed, nor form any connected sense of their own; and the whole is undoubtedly the work of a Roman sculptor, imitating only the general style and the separate delineations of the Egyptian tablets; as indeed some of the most learned and acute of our critical antiquaries had already asserted, notwithstanding the contrary opinions of several foreigners, of the highest reputation for their intimate acquaintance with the works of Greek and Roman art. We may hope, however, that in future these unprofitable discussions and disputes will become less and less frequent, and that our knowledge of the antiquities of Egypt will gain as much in the solidity and sufficiency of its evidence, as it may probably lose in its hypothetical symmetry and its imaginary extent; and while we allow every latitude to legitimate reasoning and cautious conjecture in the search after historical truth, we must peremptorily exclude from our investigations an attachment to fanciful systems and presupposed analogies on the one hand, and a too implicit deference to traditional authority on the other.

OBSERVATIONS ON DR YOUNG'S ANALYSIS.

Observations of Dr Young's analysis.

In the following observations on the preceding essay it is not intended to do more than correct the errors in principle into which its writer fell. To correct, except by occasional notes, all the faults of detail inevitable to the early stages of such an investigation, would occupy much space that can be more usefully employed. The reader will have seen that he cannot rely upon the accuracy of all the interpretations in Dr Young's essay, and before accepting them, he will do well to examine the later works referred to in this article.

Dr Young's essay is, perhaps necessarily, very faulty in arrangement, since it gives us rather the record of the progress of his inquiry, than the results of that inquiry placed in a systematic form. His method of examination need not here be further commented on, except that it should be granted that in the first instance he displayed extraordinary skill, and undoubtedly deserves the credit of having discovered the means of interpreting the hieroglyphic, hieratic, and demotic characters.

Dr Young ascertained the identity of the three modes of writing, though he was in error in calling the linear hieroglyphic, hieratic, and in making what is now called the hieratic identical with the demotic. He was correct in his supposition that the demotic expressed a vulgar dialect. He supposed the characters, whether hieroglyphic, hieratic, or demotic, to be either phonetic or ideographic, and if phonetic to be syllabic or alphabetic, a single character in the former case expressing a monosyllable or a dissyllable, which was the name of the object which it represented. It is very remarkable that he was near the truth in this case in principle, but that he applied the principle to words for which it was not employed. It has been since proved by Dr Lepsius that the Egyptians had syllabic characters; but these were almost if not wholly disused for foreign names at the period to which the Rosetta Stone belongs. These syllabic characters, however, are rarely objects standing for their names, and they are not in so large a proportion to the phonetic signs as Dr Young supposed. He was in error in not sufficiently recognising the existence of homophonous characters, which were very numerous at the time when the Rosetta Stone was sculptured, though much fewer in earlier periods. He seems also not to have understood the principle of determinatives in the hieroglyphic method, although he detected them in the demotic or hieratic. His two most important results were the separation into phonetic characters of the hieroglyphic names of Ptolemy and Berenice. Here his progress was arrested, and he did little further beyond ascertaining the meaning and sound of demotic words, the comparatively scanty alphabet of which system hindered him from discovering the general application of the principle of homophones in late hieroglyphic writing.

---

[1] This inscription is either an Arab forgery, or ancient, but executed by some artist who did not correctly understand the characters.
(R.S.P.)

Champollion's discoveries.

Champollion le Jeune, following Young's discoveries, formed the conjecture that the phonetic hieroglyphics were simply alphabetic, and at once commenced an examination of royal names, thus putting the hypothesis to the test. The result, based on partial error, was brilliantly successful, and it was not long before he was enabled to publish, in the year 1822, his *Lettre à M. Dacier*, containing a considerable number of alphabetic characters. Abandoning the demotic, Champollion set himself to apply this alphabet to all the hieroglyphic documents within his reach, and in his *Précis*, published two years subsequently (in 1824), he astonished the world with a relatively complete system of hieroglyphics, which subsequent discoveries have not much altered except in principle. His great mistake was not seeing that some phonetic characters were syllabic; but this error did not affect his results, since he had to deal for the most part with inscriptions in which the alphabetic characters had mostly supplanted the syllabic, which were formerly more intermixed with them, and he explained the syllabic signs to be abbreviations. By his *Grammaire Egyptienne* and his *Dictionnaire*, Champollion deservedly took the highest rank among Egyptologists, and it is not a little remarkable that since his death scarcely more has been done in addition to his results than was done before he took up the study.

Merits of Young and Champollion.

Young and Champollion contended in their lifetime for the honour of having discovered the interpretation of hieroglyphics, and their friends have not ceased to maintain the controversy. Too much acrimony was displayed by both the principals, and Champollion was unquestionably guilty of unfairness in endeavouring to establish his claim. The truth is, that neither can merit the claim of undivided discovery. Young, indeed, first read the mysterious characters, but his reading was not correct until Champollion had taken it up. Certainly Champollion was unable to discover what Young discovered; but it is equally sure that Young could not apply the discovery as did Champollion. It is most unfair to say that Young did little when he made the first step, and it is no less unfair to decry Champollion as a fortunate guesser when we see how little has been effected since his death. The abilities of these two great men are distinct; and while we admire the patience, the scientific skill, and the varied knowledge of Young, we need not undervalue the marvellous felicity of conjecture, power of comparison, and accuracy, which distinguished Champollion.

Chev. Bunsen's criticism of Young.

It might have been reasonably hoped that an Egyptologist who is neither an Englishman nor a Frenchman, would have been unswayed by any party feeling in estimating the merits of Young's discovery. Chevalier Bunsen appears, however, as a partizan of Champollion, and instead of pointing out the singular merits of the two great rivals, endeavours to raise the one at the expense of the other. The German scholar's observations are so ingenious that they cannot be considered except in some detail. After speaking of Dr Young's high acquirements in the physical and mathematical sciences, he goes on to mention his attempt to interpret the Egyptian characters. "His acute mind was not contented with studying the enchorial inscription. He contemplated also the deciphering of the hieroglyphic character, and applied to both texts a method, in which, and in his mode of following it out, we recognise rather the sagacity of the experienced mathematician than the native genius of the philologer." This passage is the first of a series of criticisms which seem too much as if intended to be accepted unhesitatingly, without examination. In an inquiry of this kind we should have expected, in the first instance, better results from the close reasoning of a mind trained to high mathematical processes than from the speculations of a philologer, which would be rather valuable in the second stage, as indeed was proved in this very case. We find no especial fault with the account of the subsequent results of Young's studies, until the criticism of his famous essay. Of this it is said, with reference to the opinions he had previously formed, "So firmly were these views impressed on his mind, that his closer and more philological limitation and definition of them, in his treatise of 1819 on the Language and Writing of the Egyptians,[1] which, however, formed an epoch in the inquiry, led him in many points still further from the truth, and in no instance to any certain or philologically accurate result. Afterwards, indeed, he was led clearly to perceive the difference between the hieratic and enchorial writing, chiefly by a more careful collation of the demotic papyri; but he calls the latter a second corrupt form of the hieroglyphics, the hieratic character being the first. He gives no proof of this; indeed his method neither aims at nor admits of any strict philological demonstration; but, besides, the assumption is incorrect. It is as impossible to deduce and explain the demotic from the hieratic character as it is false to define it to be purely alphabetical, as Akerblad has done." The fault here found with Dr Young is his unacquaintance with a method of philological inquiry which may be said to have been but in its infancy when he wrote, and his results are unjustly estimated. It would have been more satisfactory had we been told how it was that a treatise which "formed an epoch in the inquiry" did not express "any certain or philologically accurate result." The concluding sentence of the quotation given above is perhaps its most extraordinary portion, and we may ask from what the demotic characters are to be deduced if not from the hieratic; and that Chevalier Bunsen does derive the former from the latter is evident from the transcriptions of a hieroglyphic passage into hieratic and demotic (taken from Lepsius), at p. 594 of the volume from which we quote. Perhaps the meaning is, that the hieratic does not afford direct means of interpreting the demotic, since the one expresses the sacred, the other the vulgar dialect, although the characters of the second were derived from those of the first; but the criticism should have been more distinct. Chevalier Bunsen continues as follows:—"There was, however, one very happy result of his speculations embodied in this treatise, and which, by the impression it made upon Champollion, led to the greatest discovery of the century, the alphabet of the old Egyptian language and character. But it would be a very false view of the matter to suppose that he arrived at it by a scientific process, or upon any principle of inductive analysis. His continued comparison of demotic, hieratic, and hieroglyphic groups—for these, and not their individual elements, were the sole data for the exercise of his inventive faculties—led him, indeed, to the inference that the rings on the Rosetta Stone and other monuments contained the names of kings, which, as we have seen, had already occurred to Barthelemy and Zoega." This citation contains a more distinct opinion on Dr Young's result and his method. The former is diminished into an impression on Champollion's mind which "led to the greatest discovery of the century," where we must notice that the other great parallel discovery, which is fully equal to that of the reading of hieroglyphics, is ignored: it was made by an Englishman. As to the method, it is expressly denied that it was one of inductive analysis, and in the next sentence its essentially inductive character is proved. We do not think that the first stages of any inquiry of this sort can be conducted on strictly scientific principles, however easy it may be to apply such principles to their result. Champollion, whose marvellous success places him at the very head of acute decipherers, cannot be said to have used a scientific process except that he was guided by inductive reasoning. His *Grammaire* is absurdly unscientific in form. But both he and Young reasoned generally by induction, of which he indeed made the greater use, and neither is to be condemned for not having put his results into better shape, through a want of acquaintance with methods of arrangement subsequently matured. In pursuing the criticism, which we have not space to continue to examine in detail, Chevalier Bunsen finds fault with Young for a conclusion which, although in his case "a 'certain kind of syllabic system,' in itself a very obscure and uncritical expression," becomes in Lepsius's hands "a brilliant discovery" (p. 332). Young did indeed discover the original principle of nearly all, if not all, the phonetic characters, but failed by applying the original principle to their most debased use. The discovery is therefore to be attributed to Young, not to Lepsius, and his application of it seems to us to be an evidence of the abandonment of simple induction for the more refined process which Chevalier Bunsen recommends. The whole criticism is based on an admission of the inapplicability of the first principles of the Egyptian modes of writing to which philologers have at length arrived, to the late records by which Young and Champollion discovered the interpretation of the characters. Young's success was mainly retarded by his adhering too rigidly to a philosophic method: Champollion's was mainly advanced by his setting simple induction above all other means of arriving at the truth. We have dwelt at some length on Chevalier Bunsen's observations,[1] because we think that they are calculated to injure the reputation of Dr Young by their low estimate of his abilities, and the use to which he put them, and we are gratified to find our views corroborated by those of Dr Peacock and Mr Leitch, in the *Life* and *Works* of Dr Young, respectively.

---

[1] *Supplement* to the *Encyc. Brit.*, vol. iv., Dec. 1819.

Later researches.

Having thus endeavoured to indicate the respective merits of Young and Champollion, rendering honour to each without robbing the other, we have yet to sketch the subsequent progress of discovery after the publication of the *Précis.* As soon as the learned had thus been enabled to profit by the results of Young's and Champollion's researches, the interpretation of the hieroglyphics ceased to be confined to those who had discovered it. For a time, however, inquirers were rather engaged with the historical results of these discoveries in identifying the names of sovereigns of Egypt mentioned by ancient writers with those occurring on the monuments, than in philological questions. Mr Salt and Colonel Felix did much to apply the system to the monuments, and Mr, now Sir, Gardner Wilkinson was one of the first to make himself master of the new discovery, and to attempt the reconstruction of Egyptian history; and his earliest work, the *Materia Hieroglyphica*, evidences the importance of the fruits of his inquiry. Dr Young himself pursued his Egyptian researches, particularly in the enchorial, of his great progress in which we may judge by the posthumous *Egyptian Dictionary.* Champollion, however, carried much further than any others the study of the Egyptian characters. Having been sent, by the liberality of the French government, on a scientific expedition to Egypt, he there collected materials for the *Grammar* and *Dictionary* which appeared after his lamented death. The Tuscan expedition, conducted at the same time by Professor Rosellini, had no small share in promoting the knowledge of hieroglyphics, but its head was unable to give to philology more than an incidental attention. The next step was taken by Dr Lepsius, who, in his Letter to Rosellini, made public an important modification of Champollion's views, by showing that the greater number of phonetic hieroglyphics were, until a late period, syllabic not alphabetic, thus proving the correctness of Young's theory. The same scholar was afterwards sent on a scientific mission to Egypt and Ethiopia by the King of Prussia, and the result of his labours is the magnificent *Denkmäler aus Ægypten und Æthiopien*, now in course of publication. Five other living scholars have done good service as successors of Champollion, the Rev. Dr Hincks, Mr Birch, and the Rev. Dunbar Heath, in our own country; M. de Rougé in France; and Dr Heinrich Brugsch in Prussia. Dr Hincks and Mr Birch have from time to time discovered the signification of hieroglyphic groups previously unknown, and have published many very valuable papers. Mr Heath has applied himself to the study of the hieratic papyri, and has proved himself to be well acquainted with their contents. M. de Rougé has proved his ability by his critical examination of part of a very remarkable inscription in a tomb at Eilethyas, of which he has given an account in a memoir read to the Institute of France, wherein much new and valuable philological information is to be found, and has published many interesting papers. But it is to Dr Brugsch that we are indebted for the first great philological work which has appeared since Champollion's *Grammaire* and *Dictionnaire.* Notwithstanding the dryness of the study, he has indefatigably applied himself to the demotic character, and has been enabled at last to make public, in his *Grammaire Démotique*, a complete account of that difficult system. He has also done much to advance the knowledge of hieroglyphics.

When we contemplate the brilliant results that have already rewarded those who have devoted themselves to the pursuit of the studies which Young and Champollion rendered practicable to the learned world, it is disheartening to see so few engaged in the cultivation of these branches of learning. So much was, however, achieved by Champollion, that if any one possessing the same qualifications should now take up the study, we might hope for the most remarkable results. At the same time, the field is so wide and so rich, that there is room for all to labour, and a certainty that none will go away unrewarded.

Results of interpretation, and reasons for its correctness.

Before proceeding to the examination of what is known respecting the ancient Egyptian language, it will be desirable to give a summary of the main results of its interpretation, and the chief reasons for the correctness of that interpretation principally deduced from external evidence.

The results of the interpretation of an unknown language may be divided into the philological and the historical, the former concerning the language itself, the latter the ideas which it expresses. The former class must be again separated into the characteristics of the language by itself, and those characteristics which refer to comparative philology, and here philology is connected with history. The second class may be conveniently separated into three divisions,—the first containing the purely historical results, the second those illustrating religion, and the third, those relating to manners and customs, as well as the results bearing on science and art. This class must be considered with reference, in the present case, both to the Egyptians and to the nations connected with them. So large a subject can only be treated, as it were, in outline, for to enter into it fully would demand more space than is devoted to the whole of this article.[2]

The Egyptian language.

First, as to the Egyptian language itself. We can now form a very just opinion of its characteristics. The method of writing, the sounds, the nature of the roots, the grammar, are all, more or less, known to us, and it is hardly too much to say, that if the study is prosecuted with perseverance and zeal, the time may not be far distant at which Egyptian will be as well understood as Latin. Already, enough has been done to enable the student to ascertain the general purport of any document. If it be an historical tablet, for example, he can say that it is dated in a certain year of a sovereign of a particular dynasty, and that it refers, for example, to the subjugation of some country, and the carrying away captive of some of its inhabitants. The exact period at which the sovereign reigned, or even his dynasty, may indeed be uncertain, to a greater or less degree, the country mentioned may be difficult or impossible to identify with any known region, and many details may be hard to explain, yet the general sense will be clearly made out, and the historical fact recorded on the tablet ascertained more or less certainly. With the religious records the case is not dissimilar, although, in their case, obviously much of the meaning must be lost by our being often unable to translate every word even approximatively. Yet we know enough to form a clear opinion of the most important doctrines of the religion, as we do of the leading events of the history; and an increased knowledge of the language is not likely *of itself* to lead to any very important results in either branch of inquiry.

---

[1] *Egypt's Place*, vol. i., p. 316, *et seqq.*

[2] Some part of the following observations may seem like a repetition of the Introduction, but it may be remarked that that portion of this essay is a summary of what is here given in more detail.

We may here notice the strong evidence of the antiquity of the Egyptian language to be found in that language itself, and in the hieroglyphic method of writing it. The monosyllabic roots, and the virtual absence of inflexion and composition, prove its extreme age, while the system of hieroglyphics having probably its origin in picture-writing, is of itself an evidence of the same kind; and, if we examine the most ancient form of this system, our opinion will receive additional strength.

Another important result of Young's and Champollion's discoveries must not be overlooked—the proof thus obtained, that the Coptic is but a later form of the language of the ancient Egyptians, and thus essentially the same. It was indeed to be expected that the language expressed by the ancient characters should bear a strong resemblance to the Coptic; but that this resemblance should be as close as it has proved could scarcely have been anticipated. It is, however, readily explained, when we consider the necessarily unchangeable character of the language. In the dialect of Egyptian expressed by the demotic method of writing we have a record of the transition from the dialect of the hieroglyphics to the Coptic.

The importance of the Egyptian language to comparative philology is beginning to be understood. It forms a connecting link between the so-called Semitic group and an unknown family of languages; besides that its records are more ancient than those of any other form of human speech. We are also able to trace in it evidences of the influence of immigrations from the East, as in the presence of more than one derivative word which must have been taken direct from the Hebrew, or a sister language, since it is not formed in the Egyptian manner.

Historical results of the interpretation.

Those results of the interpretation of the Egyptian characters which illustrate the history and condition of the world in early times far outshine those which we have been noticing; and in their congruity, and their accordance with the statements of ancient writers, furnish the most conclusive evidence of the correctness of the system by which they have been obtained. We now possess a history from contemporary monuments, extending, with few considerable breaks, through a period of about twenty-six centuries, or, as some hold, through a still longer time. This history presents no internal discordance, and there is no forced agreement between its different parts. The progress of art on the monuments whence we derive the history most satisfactorily confirms it, as do the statements of ancient writers. The testimony of these last is not to be overlooked, more especially as it has not come so much from expected as from unexpected sources. Thus, admiration for the beautiful style and evident truthfulness of Herodotus had induced most scholars to prefer his statements respecting Egyptian history to the dry fragments of the native historian Manetho. But they should have remembered that Herodotus was but a visitor and a stranger, and that his veracity did not ensure that of his informers; and that, on the other hand, Manetho was an Egyptian priest, well versed, no doubt, in the ancient literature of his country, and probably commissioned by his sovereign to write its history. It is therefore no matter for surprise that Manetho has received the most ample confirmation, while many of the statements of Herodotus have been found to be incorrect, or absolutely false. Another important circumstance is that of the occurrence of the names of the sovereigns of the House of Lagus, and of many of the Roman emperors, on the monuments, in entire accordance with the history of the period.

But while the history of Egypt itself is thus restored, we are enabled from the same sources to throw light upon the annals of neighbouring nations. An Egyptian record has been discovered of one important event in Hebrew history, the subjection of Judah to Sheshonk I., or Shishak, and many other facts illustrative of the Bible have become known. The early history of the Greeks has received important light from the Egyptian records, no less than that of the nations nearer to Egypt, and this illustrative or corroborative evidence is being constantly increased by fresh discoveries.

The information as to the Egyptian religion which we have gained through the interpretation of the ancient characters has been almost wholly new. Previously, we had scarcely any reliable account even of its principal tenets and observances under the Romans. Now, we are acquainted not only with such general particulars of its state under the early Pharaohs, but we have been able partly to interpret and explain its sacred book. The results have corroborated what trustworthy information the Greek and Roman writers had handed down to us on this subject, and we are again able to elucidate wider questions than any respecting particular points of the Egyptian religion, for we can trace in it marks of different origins, and discover remains of what can only have been a patriarchal revealed religion. (See article EGYPT.)

Besides the light thus thrown upon the history and religion of the people of ancient Egypt, we, for the first time, gain a clear idea of their life and manners, of their literature, and their arts and sciences. We are astonished to find the height of their civilization, and the extent of their knowledge. But it is not only with respect to them that we gain this valuable information, for their records are not silent respecting neighbouring nations. Besides, we are able to say that this or that scientific fact was known to mankind at least as early as a particular date, that of the Egyptian monument on which we discover its most ancient mention. In this manner we can state that probably steel was used in the time of the building of the Great Pyramid, since in a tomb of that period a man is represented slaughtering an ox with a knife painted blue. From time to time we find fresh evidence of the high degree of knowledge which obtained in the remotest periods of Egyptian history, periods not far distant from the most probable date of the Dispersion of Noah's descendants; and we are thus led to form more correct notions from facts than we had previously done from theories with respect to such doctrines as those of progressive improvement.

Evidences of the truth of the interpretation.

From these particulars it is manifest that we can no more over-estimate the importance of the results which have already flowed from the new source of knowledge opened by Young and Champollion, than we can calculate the value of what may reward further inquiries. On this matter it is needless to insist, but it will not be without use to point out the resistless evidence that is afforded of the truth of the system of interpretation which has led to such results.

When we bear in mind the various records from which these facts have been drawn, by several *rival* scholars who have worked to the same results in different countries and at separate times, we find in the consistency of the results at which they have arrived, the most conclusive evidence of the correctness of the method they have employed. And we are firmly persuaded that any one who will take the trouble to verify for himself these deductions, or merely one class of them, will, except he be unfortunately the victim of a scepticism which no evidence will overthrow, rise from the examination firmly convinced of the truth of this method of interpretation. In order, however, to show that it does not depend for the proof of its truth upon the harmony of its results alone, some separate evidences are here added.

Evidence from king's names.

After a little progress had been made in the reading of hieroglyphics, travellers in Egypt began to attempt the identification of the kings' names found on the monuments with those occurring in the works of ancient writers. Among the most certain of these identifications were those of the names of the builders of the three most famous pyramids, according to the hieroglyphic orthography, Shufu or Chufu, Shafra or Chafra, and Menkura. These names corresponded to the Sûphis, or Cheops, the Chephrên, or Kephrên, and the Mencherês, Mykerinos, or Mecherinos, of the historians. This identification was based upon the similarity of sound and the circumstance that the names occurred in the inscriptions of tombs near the Pyramids of El-Geezeh, until the results of the late General Vyse's expedition threw an unexpected light upon the matter. In the course of the examination of the Great Pyramid by that expedition, some chambers were discovered which had never been previously opened since the edifice was raised. These new apartments were a series of entresols, one above the other, over the King's Chamber, intended to lighten the weight of the superincumbent masonry. In them were found marks scrawled on the stones by the masons who cut them from the quarry, or placed them in their present position.[1] These marks were therefore contemporary with the building of the pyramid. In them occur the names of two sovereigns, Shufu and Num-shufu, one of whom had been previously concluded to be the builder of the pyramid, and the other the next king of his dynasty. Nor was this all. In the examination of the Third Pyramid, a portion of a mummy-case was discovered bearing an inscription which proved that it originally inclosed the body of King Menkura, who had been before identified with the Mencherês, or Mykerinos, who founded this monument.[2] No one will be rash enough to assert that these are fortuitous coincidences.

Evidence from quadrilingual inscriptions.

Very striking evidence is afforded by certain quadrilingual cuneiform and hieroglyphic inscriptions, which are the more valuable from their showing that the three systems of arrow-headed writing have received a true interpretation no less than the ancient Egyptian characters. Two examples of quadrilingual inscriptions of this character are known to exist in modern collections. They are on vases, one of which is known as that of the Comte de Caylus, and the other is in the treasury of St Mark's at Venice, and are in hieroglyphics and the three kinds of cuneiform characters, expressing the names and titles of Persian sovereigns. The systems of Young and Champollion on the one hand, and of Grotefend and his successors on the other, will be found, without any change or modification, to afford the same reading in their respective languages to the double inscriptions.[3] Since this evidence cannot be set aside, some will admit that the royal names can be correctly read in Egyptian, but that nothing further has been satisfactorily determined. But when this concession is made, the truth of the whole system is at once of necessity admitted. As M. de Rougé has very justly remarked, two forms of the royal names afford examples of every mode by which ideas were expressed in hieroglyphics.[4] And not only is the truth of the method thus proved, but from the royal names we can form an alphabet that will afford a sufficient basis of interpretation.

Evidence from Chæremon.

The most complete and remarkable confirmation which the interpretation of the Egyptian characters has received is afforded by the recent discovery of a fragment, or a series of citations, of the lost work of Chæremon on hieroglyphics. This valuable evidence we owe to the research of Mr Birch, who has brought it forward and criticised it with his usual skill and learning, in a paper read to the Royal Society of Literature.[5] Referring to this paper for the complete details, it will not be necessary here to do more than point to the main results, and cite the passage in which the fragment is preserved.[6] Chæremon was an Egyptian by birth, a sacred scribe, and keeper of the Library of Alexandria towards the close of the first century of the Christian Era. He was known to have written an Egyptian history, and to have been the author of a work entitled Ἱερογλυφικά. It is of this work that Mr Birch discovered a fragment in the Commentary on the Iliad by Tzetzes the grammarian. The passage in question contains the explanation of nineteen hieroglyphic signs, whereof three have more meanings than one, making altogether twenty-six significations. Of these, fifteen agree with the results of Young's and Champollion's method, and have been for the most part long known, and are thus certain. Three are probably, and other three possibly, to be placed in the same class, from their similarity; while but five are positively unknown, and there is no contradiction. Considering the short time that the method of interpretation has been discovered, and the confessedly imperfect state of the study as regards what we may call the vocabulary, intending by that term words, however written, this agreement is greater than could have been expected, and furnishes the most conclusive confirmation of the truth of Young's discovery. Those who require mathematical demonstration in arguments which can only be treated by the laws which apply to the examination of evidence will no doubt be disappointed. But such we would ask to demonstrate mathematically any one historical fact, or even their own existence. We are firmly convinced that the interpretation of the Egyptian characters is capable of the most convincing proof, and that if we have not produced that proof in its strongest form, we have adduced evidence that will enable more practised logicians to do this in an irresistible manner. This has certainly not been hitherto done, partly because one who is firmly convinced of the truth of any system is often unable from that conviction to place himself in an independent position, so as to prove his case, and falls into the error of arguing in a circle; and partly because those who have studied hieroglyphics have felt that it would not be worth while to attempt to prove the truth of what is shown by its results to be true. Some have thought, too, that it would be derogatory to reply to the objections of those who seemed to condemn a new study simply because it was new, or sat in judgment on a cause without making themselves acquainted with the language of those who pleaded it. We may now pass on to the next portion of our subject—an examination of the ancient Egyptian language; and this will afford to the philologer the most satisfactory evidence, not alone of the truth of the system of interpretation, but of the accuracy of its details.

SECTION III.

THE EGYPTIAN LANGUAGE.

Philological place of the Egyptian language.

The Egyptian language has not yet been classed by the general agreement of the learned in the so-called Semitic group, or as belonging to another family. Several of those best acquainted with this language, particularly Bunsen, Lepsius, and Benfey, the last of whom treats only of its Coptic form, have come to the conclusion that it must be assigned to the Semitic class, while their arguments have been answered by Ewald, Renan, and others, who maintain it to be essentially distinct, and representing the earliest form of what may be called Hamitic languages, if such a group can be made out. Bunsen, in his late work on comparative philology, even goes so far as to assert the Egyptian to be the earliest form of Semitic speech. He, and those who more or less hold with him, find in the almost perfect identity of the Egyptian and Hebrew pronouns, and in other less striking points, conclusive evidence; while their opponents maintain the essential distinction of the two languages, and the impossibility of tracing one to the other by any known principle of change.[1] Those who support the former theory are most distinguished as comparative philologers, but their opponents are rather known for their acquaintance with Semitic languages. The opinion of these last, therefore, that the Egyptian cannot be of the Semitic stock, must not be set aside without good reason, although its acceptance has seemed to involve a dilemma. In a recent work, a theory has been proposed which harmonizes the results of the inquirers on each side. Therein it is suggested that the Egyptians were a mixed race sprung from a settlement of Noachians, that is, philologically, a people having a Semitic speech, for the Semitic, it is argued, must not be restricted to the descendants of Shem, among an aboriginal population possessing a language resembling in its essence the Chinese. Thus the Egyptian, in the main a non-Semitic tongue, might naturally present essential Semitic peculiarities.[2]

It is impossible, however, in the present state of comparative philology, the imperfections of which are shown by its having led its most distinguished students to such different views as those of Bunsen and Ewald with respect to the Egyptian language, for us to push the inquiry any further, and endeavour to determine how much of that language is actually Semitic and how much non-Semitic. Far less can we determine on philological grounds when the Semitic element was introduced, nor to which Semitic tongue it may be most reasonably referred.

Various influences affect the change of languages so differently that induction seems only to lead us to the most general conclusions. Thus, in America, we find numerous languages almost wholly differing in their vocabulary, but almost identical in their grammar. In the so-called Indo-European class, on the other hand, we see languages differing in their roots little more than do dialects of one tongue, yet distinguished by remarkable variations in their grammar. The physical condition of a race, its mental state, its intercourse with other races, produce results that forbid us to establish strict general laws of change, and if such is the case as to philology in itself, it is so in a much higher degree with reference to its application to history. If we carefully investigate the linguistic changes that have occurred to certain races, or the inhabitants of certain countries, within periods of which we know the history, we shall perceive again the difficulty of establishing strict general laws, and the dangers which attend an attempt to restore history by means of comparative philology. Whether we hold these views or not, our means of judging will be rendered more numerous by the most accurate outline that we can obtain of the structure and history of every language of mankind. Such an outline and history it will be our endeavour here to give of the language of the ancient Egyptians.

I. GRAMMATICAL SKETCH OF THE ANCIENT EGYPTIAN LANGUAGE.

Grammar.

§ 1.—SOUNDS.

Sounds.

Our knowledge of the sounds, or vowels and consonants, of the ancient Egyptian language, must be derived from a comparison of the Coptic alphabet with the hieroglyphic and demotic alphabets founded upon the Egyptian renderings of proper names, &c., independently of the Coptic. The first step in this inquiry will be to reduce the Coptic alphabet by rejecting those letters which were simply introduced to express Greek words, as well as those which are properly compound. In the next place we shall endeavour to ascertain whether any letters of the alphabet thus reduced are proper to one dialect alone, either of the Coptic or of the more ancient language; and having thus determined, as nearly as may be, how many letters composed the alphabet of the sacred dialect of Egyptian, we shall strive to fix within certain limits their sound. When it is remembered that the pronunciation of some letters of the Greek and Latin alphabets is still matter of controversy among the learned, any one will admit that a perfectly exact result is not to be expected in the present case. But if we take care to separate in our minds the question as to the correspondence of a letter in Egyptian to one in Coptic, or in another language, from that of its exact sound in either language, we shall not only avoid error, but find the results of our inquiry in reality much more definite than we should have supposed. It matters very little, for example, whether we pronounce the Greek χ as a *k* or as a German *ch*, so long as we do not found philological arguments on its sound. It is something to know that χ and κ have distinct though related sounds, and that they correspond to certain letters in kindred languages.

Coptic alphabet.

The letters of the Coptic alphabet are thirty-one in number, and are written as follows:—

ⲁ ⲃ ⲅ ⲇ ⲉ ⲍ ⲏ ⲑ ⲓ ⲕ ⲗ ⲙ ⲛ ⲝ ⲟ ⲡ ⲣ ⲥ ⲧ ⲩ ⲫ ⲭ ⲯ ⲱ ϣ ϥ ϧ ϩ ϫ ϭ ϯ. They are taken from the Greek alphabet, which is comprehended entire in the Coptic, with the addition of six characters, adopted from the demotic and hieratic systems, and one compound character. On referring to the lexicons, we find that five of the Greek letters, ⲅ ⲇ ⲍ ⲝ and ⲯ, are not employed for Coptic words, except for an extremely small number, none of which are common roots, and some of which are of doubtful authenticity.[1] These letters have been used for the Greek words which are so numerous in Coptic literature, and cannot properly be assigned to the language. In the next place we must exclude ϯ, as a compound letter. Twenty-five characters remain, which form the genuine Coptic alphabet. Certain of these letters, however, are peculiar to one dialect, being very generally substituted for other letters, and therefore represent a particular pronunciation. Whether this pronunciation be the right one or not, we are warranted in excluding the letters which represent it as dialectal variations. The letters in question are ⲑ ⲭ ⲫ and ϧ, which are peculiar to the Memphitic dialect,[2] and very generally take the place of ⲧ ⲕ ⲡ and ϩ, in the other dialects, being the aspirated forms of those letters. In addition to these we find ⲗ and ⲣ very often interchanged, and ⲣ almost always replaced by ⲗ in the Bashmuric dialect. The confusion of these two letters is evidenced by our finding Cornelius written ⲕⲟⲣⲛⲏⲣⲓⲟⲥ.[3] The frequent interchange of ϫ and ϭ is another case of the same kind, and we are warranted in concluding that ⲗ and ⲣ, as well as ϫ and ϭ only represent different sounds of the same letter. The vowels we must likewise reduce; for comparative philology leaves little room to doubt that the Egyptian language had but three vowels—*a*, the sound of which sometimes resembled that of *e*, *i* or *ee*, and *u* or *oo*, besides a short vowel, inexpressed. The manner in which the vowels interchange in Coptic favours this supposition. The result of our inquiry thus far gives the following alphabet :—

---

[1] Though we might agree with M. Renan in considering the pronouns, which show the most important points of agreement with Semitic languages, to be linguistically accidental, yet they are logically essential since they cannot have been accidentally introduced, for how can we suppose a language without pronouns? *Histoire Générale des langues Sémitiques*, vol. i., p. 72, *et seqq.*

[2] *The Genesis of the Earth and of Man*, pp. 210, *et seqq.*

ⲁ	ⲃ	ⲓ	ⲕ	ⲙ	ⲛ	ⲡ	ⲣ	ⲥ	ⲧ	ⲱ	ϣ	ϥ	ϩ	ϫ
a	*b*	*i*	*k*	*m*	*n*	*p*	*r*	*s*	*t*	*ō*	*sh*	*f*	*h*	
ⲉ		ⲉ	ⲭ			ⲫ	ⲗ		ⲑ	ⲟ			ϧ	ϭ
ĕ		*ĕ*	*ch*			*ph*	*l*		*th*	*ŏ*			*kh*	
ⲏ		ⲏ								ⲟⲩ				
ē		*ē*								*ou*				

(The ⲩ has usually the form ⲟⲩ, the Coptic having properly no simple ⲩ.)

Egyptian alphabet used for Greek and Latin proper names.

This result may be tested by the manner in which foreign names are written in hieroglyphics. Unfortunately, Greek and Latin names are the only ones which are numerous enough to enable us to form an alphabet, and they do not afford us direct evidence as to those sounds which are unknown to their respective languages. From these Greek and Latin names we form an alphabet of twelve letters :—

A	B	C	D	H	I	L	M	N	O	P	S
E	V	G	T			R			U	Φ	
		K	Θ						V	F	
		Q									
		χ									

This alphabet is of great value, since it establishes the close similarity, if not identity, of sounds that afterwards became distinct.[4] Three of its peculiarities require especial notice—Firstly, no distinction is made between the *G* and *K* sound, which is a strong evidence to show that there was no letter corresponding to ϫ and ϭ in the ancient Egyptian. Secondly, *L* and *R* are not distinguished, although they are distinguished in the demotic. We find the signs which are employed in demotic for *L* and *R* used in hieroglyphics of the same period for these letters indiscriminately, whence it appears that the separation in writing of the two sounds was an innovation which was not admitted into the sacred dialect; nevertheless, these sounds were never perfectly distinguished in the Coptic, as the instance of their confusion given above may serve to show. Thirdly, *F* and Φ are represented, since the Latin names are rendered from Greek transcriptions, by the same characters, and yet the Copts found it necessary to add a letter, ϥ, to the Greek alphabet, to represent a sound supposed to be that of *F*. The reason might, indeed, be that the Greek Φ was not pronounced *Ph* but *Fh* but rather that the Egyptian *F*, like the Æolic digamma, approached the sound of *V*. In support of the former assertion, it may be observed that the name of Philip Arrhidæus has been found written in hieroglyphic characters PHILIUPUS, instead of PILIPUS, according to the usual orthography, the *P* being in both cases represented by the same character; and in corroboration of the latter assertion it must be remarked that in Coptic ⲡ interchanges with ⲫ, and ⲫ with ⲃ, while ϥ interchanges with ⲃ and ⲟⲩ. We may therefore infer that the Egyptian *P* corresponded to the Greek Π and Φ and perhaps the Latin *F*, and that the Egyptian *F* was rather a *V*, though not a *Bh*. In modern Greek we have *Bh* and *V* in the pronunciation of Β and Υ. The best parallel to this case is that of the Latin language, in which, contrary to the Greek usage of rendering *F* by Φ, the Greek Φ is never represented by *F*, but always by *Ph*, although the Italians and Spaniards have lost the distinction, as did the Copts, and write Filippo, and not Philippo, Felipe, not Phelipe. There is a difficulty in the supposition that the aspirated form of *P* was *Fh*, and not *Ph*, or both, as it would not in either case strictly follow the analogy of the aspirated form of other letters; but the parallel instances show that such has been the case in the other languages, and warn us against reasoning as to what a thing ought to be, instead of endeavouring to ascertain what it is.[5]

Coptic letters unknown to Greek and Latin.

We have yet to examine those letters of the Coptic alphabet which are unknown to the Greek or Latin, that is, ϣ, ϥ, ϫ, and ϭ. As these letters have forms derived from those of demotic characters, themselves traceable to hieroglyphics, it is important to ascertain, if possible, what sounds these hieroglyphic characters conveyed. ϣ is traceable through demotic and hieratic forms to a common hieroglyphic character never employed in writing Greek and Latin proper names. It occurs in the names of some well known kings, as the two

---

[1] ⲝ and ⲯ are sometimes used for their component letters in Coptic words, by way of abbreviation.

[2] ⲑ is not used, but as an abbreviation of ⲧϩ, except in the Memphitic dialect.

[3] Peyron, *Gram. Copt.*, p. 4, which see for a fuller account of the changes of the Coptic letters.

[4] It is to be noted that the hieroglyphic signs were used for the sounds they originally represented, at the same time that their demotic forms were employed for a different sound or sounds which had arisen from the changes of the language.

[5] Without attempting to disparage the extraordinary critical skill which has been displayed by recent scholars in discovering the *original meanings* of particular derivatives and grammatical forms, it may be safely asserted that many have pushed the results thus obtained too far when they have supposed these original meanings to have been always, or even often preserved. They have thus been led either to repudiate senses which usage proves to have been assigned to words or forms, or to accommodate those senses to their preconceived opinions. Although this method does not produce very serious evils when applied to the highly philosophical Indo-Germanic languages, it would be disastrous in its results were any one bold enough to try it with the Semitic group.

Hieroglyphics.

called Shebek, where it has been rendered in Greek by Σ (Σαβακῶς, Σαβάκων, Σαββάκων, Σεβιχὼς, Σεύηχος), and in the case of one of these kings, in Hebrew, by ס, (סוֹא). The same character is twice employed in the name Sheshonk, which has been written, in Greek, Σέσογχις, Σέσωγχις, and Σεσόγχωσις, &c., and in Hebrew, שִׁישַׁק. There is no doubt that this letter had a sound resembling that of s, and was its aspirated form SH. ϥ is likewise proved to have been a letter unknown to the Greek alphabet of the time of the Ptolemies and Cæsars, since its hieroglyphic form, which may be traced through the demotic and hieratic, is not employed in writing Greek proper names, nor, indeed, in Roman ones, which, it should be remembered, were spelt according to their *Greek* orthography. When, however, a name containing this letter has been transcribed in Greek characters, we find it represented by Φ, as in Νεφερχέρης, ῎Ομφις,[1] Μέμφις, for Nufr-ka-ra, Un-nufr, Men-nufr. Its sound thus nearest approached that of Φ, though it had not the sound of that letter, as is clearly shown by Φ never being represented by it. The hieroglyphic character whence it was taken seems therefore to have resembled *F* in sound, and we have already shown that it must have been pronounced like the kindred letter *V*. We retain the character *F*, however, for this sound, as it seems to have been intermediate between *F* and *V*, though more nearly resembling the latter, to prevent needless change, and particularly as the German *V* affords an instance of an inconsistent use, the very converse of this. ϫ may be clearly traced to a hieroglyphic sign which is the initial letter of the common name of Egypt, and of the adjective "black," which has the same orthography. Both words are rendered in several ways in Coptic, but their initial letter is *always* ⲕ or ϫ. Now, as the sign in question is properly used for the words above mentioned alone, it should here be rendered by ϫ in Coptic, were that letter one of the ancient alphabet. We are therefore warranted in excluding it. ϭ which very frequently interchanges with ϫ, of which it is to be regarded as simply another form, is traced to a common hieroglyphic sign used for K in very many Greek names and Latin names taken from Greek transcriptions. It sometimes stands for the Greek Γ, to which the Egyptians had, as we have seen, no equivalent. The letter ϭ cannot, therefore, be assigned to the ancient alphabet, and with it must fall its variant ϫ, which we have already rejected for another reason. It is not improbable that ⲕ, ϭ, and ϫ, represent three modes of pronouncing one letter, as in Egypt in the present day, the two letters Káf and Kkáf (the Hebrew Caph and Koph, and Greek Κάππα and Κόππα), have three pronunciations, that is, Káf is a simple K, and Kkáf a guttural K, pronounced by some as a very hard G. It is probable, from their having been so anciently distinguished among the Hebrews and Greeks, that the old Egyptians had both a simple and a guttural K, but there is no evidence to show that they represented them by different signs; and we may reasonably suppose that the Greeks, Hebrews, and Arabs, did not *originally* distinguish letters the names of which are so strikingly similar. They may have been in all three languages originally dialectal peculiarities of pronunciation not distinguished in writing. The result of the inquiry thus far may be now stated hypothetically that we may take the next step in its prosecution. In this table we have given HH and KH as the stronger form of H and aspirated form of K, adding those by which we represent them, KH and CH. We should prefer the more accurate forms, but we have retained those in use not to cause confusion.

Hieroglyphics.

Vowels.			Consonants.										
A	EE	OO	B	H	K	M	N	P	R	S	T	SH	F
Ĕ	Ē	Ō	BH	HH (*kh*)	KH (*ch*)			PH FH	L		TH		V
Ē	Ī	U			KK			F					
	Y	W											

Separate examination of Egyptian letters.

Each of these letters must now receive a separate examination in order that we may ascertain, as nearly as may be, its general sound and dialectal differences, although some part of this inquiry has been anticipated in the preceding remarks. It will be most convenient to arrange them in a philosophical order, first, the aspirates *a*, *i*, *u*, the inexpressed vowel *ĕ* and *h*; then the liquids *m*, *n*, *r*; then the sibilants *s*, *sh*; and lastly, the mutes *b*, *f*, *p*, *k*, *t*.

Vowels.

With respect to the vowels, it is important at the commencement to ascertain the place they held with respect to the consonants, when they were written always, when always omitted, and when optionally written or omitted. The vowel A is rarely omitted at the commencement of a word, and EE and OO are never so left out. The reason is probably that the latter two are frequently, when so placed, consonants, having the sound of Y and W. Incipient vowels are therefore generally written. Medial vowels are frequently omitted, as also are final vowels. These particulars regard syllables and words of which the vowel or vowels are sometimes at least expressed. There are, however, syllables and words in which vowels are never written, and these inexpressed vowels appear to be short rather than long. It should be observed that in the Coptic a medial or incipient vowel, *generally* ⲉ (*ĕ*), is frequently omitted, its omission being indicated by a line over the consonant following in Sahidic, and a grave accent in Memphitic. Those roots which usually or always drop their vowel in Coptic are often the same that always do so in the hieroglyphic writing. Hence we may conclude that the consonants were more important than the vowels, and the long vowels, as we might analogically suppose from our previous conclusion, more important than the short. This opinion is confirmed by the place of the vowels. Very generally in the most ancient inscriptions, and frequently in the later ones, the medial vowel of a syllable is written after the consonant or consonants which it preceded in sound: thus, SHUNS (khuns), was always, when fully written, written SHNSU. We may therefore infer that the vowel letters, except when they had the sound of consonants, were of secondary importance, and that the short vowels were rarely expressed. It is unnecessary to do more than advert to the striking similarity of the Egyptian language to the Semitic group in this particular, as it is too obvious to be called in question.

The vowel A had two sounds, A and E. The former sound is proved by transcriptions of Egyptian names into Greek, or of Greek and Roman names into hieroglyphics; the latter, by the circumstance that the most common form of the vowel EE is one of the usual signs for A, twice written. This first vowel appears—if we may judge from euphony, and the high probability that the short vowel usually omitted was *ĕ*—to have represented long and short A, and also sometimes long E, but most frequently the first of these three sounds. It may sometimes have approached to the sound of O or U, both short, like the Arabic vowel, Fet-hah, which has frequently that of *a* in "beggar," or the Hebrew Kametz, which has been separated into two vowels, an *a* and an *o*. It would be important could we ascertain whether this vowel, when at the commencement of a word, ever became a consonant like the others. It must be remembered that א ו י in Hebrew, and ا و ى in Arabic, are acknowledged to be sometimes consonants, and though the consonant sound of א has been lost, that of ا is preserved by the addition of the sign Hemzeh, which resembles in sound the French aspirated *h*. The "smooth breathing" of the Greeks was probably a similar catch. On these grounds it is most reasonable to suppose that if the first Egyptian vowel ever became a consonant, its sound was that of the Arabic ا, with Hemzeh, rather than that of the rough guttural ע ع of the Hebrews and Arabs. Sometimes we find two signs for the first vowel at the commencement of a word, where, if we assign to them the same sound, which the Coptic forms warrant our doing, we cannot pronounce them without slightly aspirating the first 'A-A (in French '*haa*), or reading it as an aspiration 'A ('*ha*);[1] except, indeed, we attribute to it the strong sound of ע, but this is inconsistent with the use of the two signs in question for the same Greek vowel. We have already seen, that the Egyptians were careful not to employ signs representing sounds unknown to the Greeks and Latins for Greek and Latin letters resembling them. If they did not write Sheverus, nor Filippus or Vilippus, we cannot suppose they wrote the names of Adrian (not Hadrian, for they adopted the *Greek* form) and Antoninus with an ע, as those must do who accept the theory of Dr Hincks on this subject.[2] The probability of a perfect analogy with the Semitic languages as to the vowel system, both in the sounds and the manner in which those sounds were expressed, is a very important point of evidence, though we must remember the case of the Greeks, whose Iranian language was expressed in an alphabet shown by external and internal evidence—the latter including the vowel letters—to have been in its original form derived from a Semitic source, though the latter may have been of Turanian origination. The first vowel appears, therefore, to have most probably had the sounds 'A, Ā, Ă (sometimes like Ŭ) and E. It is represented in this essay by A, to which it generally corresponded.

---

[1] *Plut. de Isid. et Osir.*, cap. 42.

The second vowel presents no difficulties. It has two forms, both of which are formed by the repetition of a sign. The original of one of these, two sloping lines, seems to have been lost;[3] but that of the other, two reeds, is one of the most usual signs for the first vowel. It is therefore a double letter, having a sound of the first vowel repeated, or lengthened, which, in a medial or final position, amounts to the same thing. As an incipient letter, it was, as we shall see, a consonant. Its sound is determined by our finding it consistently rendered by the Coptic ⲓ, the Greek ι, and the Hebrew י. As a vowel, therefore, its sound was that of our EE. At the commencement of words where it is immediately followed by another vowel its sound must necessarily be that of Y, as is shown by its being then equivalent to י, as in YUM, יָם, "sea;" YUTEH יְהוּדָה, "Judah."[4] Two sounds, therefore, suffice for this letter, Y and EE.

The third vowel corresponds to every form of *o* and *u* in Coptic, but its prevailing correspondent is the diphthong ⲞⲨ, which is the same as our sound OO. It is equivalent to the Hebrew ו, as in the word YUTEH, יְהוּדָה, "Judah," quoted above, and was used for the Greek ο, ω, and ου. It can be shown sometimes to have the sound of a consonant, W, at the commencement of a word, for the same reasons which have induced us to assign the sound of Y to the second vowel when similarly placed. Our main difficulty with respect to this vowel is to decide whether or not it has ever the sound of a short O or U. The settlement of this question partly depends upon the probability that the first vowel had sometimes a sound resembling O or U, both short. The sound this letter must have had when it became a consonant, its prevailing correspondence with the Coptic diphthong ⲞⲨ, and the probability that it was analogous to the second vowel, render it most reasonable to suppose that it had, when a vowel, the sound of U or OO. We cannot, however, prove it to have been a double vowel, or constantly long; and we therefore retain for its vowel sound the letter U, which has been frequently employed for it, particularly as the constant use of OO would be cumbrous: we therefore represent it by W and U.

The sound of the fourth, or inexpressed, vowel remains to be considered. It has been noticed above that the inexpressed vowel in Coptic is generally ⲉ (*ĕ*) and that the roots which usually or always drop their vowel in Coptic are often the same as those that always do so in the hieroglyphic system. Chevalier Bunsen has justly compared this vowel with the Hebrew Sheva, and represented it by a short E. Like Sheva, which sometimes had the sound of a very short A, whence originated Hateph-Pathah, at others that of a very short E (Hateph-Segol), differing, in what we know not, from its original sound, and at others that of a very short O (Hateph-Kametz), though it generally retained its original sound, so it is not improbable that the Egyptian inexpressed vowel represented other sounds besides that of E. This, however, we may regard as its prevailing sound. It must be borne in mind that it is convenient to employ this short E wherever we do not know the vowel or vowels of a word, so that it must be regarded in such cases as in some sort as a conventional sign. In order, however, to distinguish between this letter when thus used, and when representing, either certainly or very probably, the inexpressed vowel, it is written in this essay in the former case small (*e*), and in the latter large (E). As the long E is represented, according to our theory, by the vowels A and EE, it is not necessary to distinguish this short E by a mark of short quantity. The inexpressed vowel, therefore, which was probably the only real vowel of the ancient Egyptians, had thus the sound of E short, and occasionally other sounds.

Consonants.

In considering the consonants we must first examine H. In Coptic we find three letters representing different sounds of H, namely, ϩ, ϫ, and ϧ, simple H, CH, and KH. The first of these is undoubtedly found in the hieroglyphic system; the second cannot be a variant of it, since it interchanges with SH, and since, in Manetho's Lists, K is generally rendered by its Greek equivalent χ. ϧ remains, which may be properly considered as the strongly aspirated form of ϩ. It will be shown, by arguments which the analogy of the system confirms, that there was no separate letter in the hieroglyphic system corresponding to ϧ, and those arguments indicate that the two sounds did not exist in the pronunciation of the sacred dialect. We may next pass by M and N since their sounds are established, with the remark that N was probably pronounced M, as by the Copts, when immediately followed by B, M, and P. L and R are represented by one consonant. We do not find them distinguished except in the demotic, and they are frequently confounded in Coptic. In that language, however, we trace their separation in the circumstance that in the Bashumric dialect the Memphitic and Theban ⲣ is almost always rendered by ⲗ. The greater number of words in Coptic containing the letter ⲣ than ⲗ, the general use of ⲗ for ⲣ in the worst dialect, all tend to show that the prevailing sound was ⲣ. That sound we may safely assign to the consonant in question, bearing in mind that it may sometimes resemble L, or even correspond to that letter. We do not find any traces of an aspirated R, RH.

---

[1] The latter reading is the more probable, since the two signs occur in monosyllabic roots.

[2] *Trans. Roy. Ir. Acad.*, vol. xxi., pt. 2.

[3] The two sloping lines may, however, be the double of the single straight line, representing A.

The letter S presents little debatable matter, for the supposition as to its sound to be mentioned below is but conjectural. This, however, is not the case with SH, the sound of which we must endeavour to ascertain. It has been already shown that its proper sound was SH, but there are strong reasons for supposing that it was pronounced CH or KH in one dialect. Thus Herodotus calls SHUFU Χέοψ (Χέοπα); the names Xerxes and Artaxerxes are written SHSHEEURSH and ARTASHSHESHES, in which cases a sign for SH is evidently employed as CH or KH. But as the sign which in every one of these cases represents CH or KH is sometimes rendered by ϣ in Coptic, and as Herodotus can only be supposed to have given the pronunciation which he heard, while foreign names could only be rendered by the letters nearest resembling their sounds, these examples afford no convincing evidence, nor has any such been adduced. Even Chevalier Bunsen, who has separated the two sounds as distinct letters in his vocabulary, does not propose to maintain that they were originally separate, for he says that it is doubtful if at the earliest period there were any distinction between them.[1] If we suppose, as is most reasonable, that the two sounds were represented by one letter, we have still to determine whether they existed in the sacred language, or were differences of dialects. The smallness of the alphabet, and the undoubted certainty that certain other letters had more than one sound, would indeed incline one to the former view, but a consideration of the relation of the two sounds will convince him that this supposition would be at variance with the analogy of the language. SH should rather include the sound of S, which indeed it may, like the Hebrew שׁ, if the letter usually called S be a hard letter (SS) like ס. On the other hand, the interchange of SH and CH or KH is a natural occurrence, of which many instances might be produced, as in the derivation of Guadalaxara (Guadalachara) from Wádi-l-Asharah, and of Sherry from Xeres (Cheres). This peculiarity exists also in the Coptic, ϣ interchanging with ϫ, but not with ϧ, a circumstance of great importance, since the last letter is derived in its *form* from one of the hieroglyphic signs most commonly corresponding to the first and second. This circumstance shows that ϧ, which is maintained to be the representative of the ancient sound, is derived from a hieroglyphic equivalent of letters which do not interchange with it in Coptic, and thus the argument based on the form of ϧ being ancient is not valid. This evidence in showing that the SH and KH were only separate letters by reason of the dialects (the SH of the sacred dialect being rendered in the vulgar dialect, or its Memphite form, by KH),[2] forbids us to imagine them to have been ever distinguished in the hieroglyphics.

Of the mutes, B appears to have been sometimes aspirated, taking a sound resembling V, that is, BH. For this we have double evidence, since in Coptic Ⲃ interchanges with ⲟⲩ, ϥ, ⲫ, and thence even ⲡ; while in the rendering of Latin names, through Greek, its hieroglyphic correspondent is employed for *ου*. Here again we must inquire whether this is the result of the difference of dialects, or whether the two sounds existed in the sacred language represented, as probably in Hebrew, by one letter.[3] The latter seems probable, since, on the one hand, it is not reasonable to exclude B from one dialect, and on the other, because, if B were never BH, then V would have been always represented by F, which it never is, and thus Seferus would have more nearly represented Severus (Σεουηρος) than Seberus. We shall see, too, that the weight of evidence is in favour of the existence of aspirated sounds of several letters, that is, of certain letters having been sometimes aspirated in the sacred dialect. The pronunciation of the next letter F has already been determined as that of a V approaching the sound of F. The letter which we have called P is used for the Greek Π and Φ, whence we may infer that it had the true sound of the latter (being probably pronounced FH, or perhaps P'H), no less than the sound which we usually ascribe to it, PH. The one hieroglyphic letter K corresponds partly or wholly to the Coptic ⲕ, ϫ, ⲭ and ϭ, that is, to K, KH (CH), and KK, for there can be little doubt that the last two (ⲭ and ϭ) represent a harsh K (ק, ق, and *κόππα*). The first sound K is unquestionably made out, and may be considered the proper sound of the letter, and its aspirated form is shown to have been known to the sacred language by examples of Manetho's transcriptions of kings' names given in a note ([2]) below. Lastly, T appears to have also had the sound of TH, though not of D. Although the T was employed in the time of the Ptolemies and Cæsars to represent the Greek Δ as the nearest sound, the first introduction of D into the language is under the form NT, for so was the name of Darius spelt, NTEREEUSH, whence, as this was probably a simple D in both old Persian and Greek, we may infer that sound to have been unrepresented in the Egyptian alphabet. T seems, however, to have had sometimes the sound of TH in the sacred dialect, for such would have been the case by analogy, and the transcriptions of Egyptian names would lead to the same inference.—It has not been attempted in these observations to determine, in the cases in which letters appear to have had in the sacred dialect more than a single sound, when a letter took one sound or another, or, in other words, when its sound was changed by its position. Some steps may be taken towards doing this; but the carelessness of the ancients in the transcription of foreign names into Greek, and the corrupt orthography of Coptic, render the probabilities of great success very slight. Still, by the application of the inductive process, which is not sufficiently employed in inquiries of this nature, it may be possible to obtain more satisfactory results than those at which we have hitherto arrived. In the meanwhile, the following table gives a statement of the fruits of our examination of the Egyptian alphabet.

---

[1] *Egypt's Place*, vol. i., pp. 490, 572.

[2] Manetho, who may be fairly concluded to have given, as nearly as he could in Greek, the pronunciation of the sacred dialect, seems generally to have rendered the SH by ς, employing the χ for κ aspirated. The examples are Σώϋφις, SHUFU; Σοῦφις, SHUFU; Σεφρὴς, SHAFRA. We find, however, Ἀχερρῆς or Χευχέρης, or Ἀκεγχήρης, for ASHENATENRA, where SH is rendered by χ or κ, and Ψιναχῆς for PEANSH. These are the instances that occur in the Dynasties. In the fragments of the history we find Σὼς for the Coptic ϣⲟⲟⲥ, ϣⲱⲥ, or ϣⲱϣ. The χ on the other hand is frequently used for the letter κ as its aspirated form: thus, Καιέχως, or Χοὸς KeKU; Χαίρης, MENKARA; Νεφερχέρης, NUFRKARA; Χενερὴς, KAËNRA; Ἄχης, 'AÄKU; Μευχέρης, MENKURA; Οὐσερχέρης, USERKEF; Νεφερχέρης, NUFRARKARA; Μευχέρης, MENKAHER; Σέσογχις, SHeSHeNK; Σεβιχὼς, SHeBeK (but SHeBeK also Σαβάκων); Ψαμμήτιχος (also Ψαμμίτιχος), PSEMETEK; Νεχαὼ, NEKU; Ἀχωρις, HAKeR;—as positively against these can be adduced nothing but Ὀσοχὼρ, the corrupt transcription of AMENSAPeHER.

The number of examples from which selection has been made has been in most cases very limited, since many words have been excluded for various reasons. In the case of the use of hieroglyphic letters for Greek names, or Latin names written in Greek, it has seemed desirable to choose examples as far as possible of the earliest times at which this transcription was usual. In like manner, the examples of the transcription of hieroglyphic words into Greek characters have been chosen from those writers alone who understood the hieroglyphic writing, or from those who drew their information from such writers. To have referred to others who merely give the pronunciation of the common people would have involved the inquiry in confusion and error. With respect to the instances of Hebrew words rendered by hieroglyphics, it has been necessary to exclude such as appear to have been adopted into the ancient Egyptian language, whether proper names or not, and to reject such parts of words as seem to be only Egyptian forms, not literal transcriptions. As to these and the Egyptian words written in Hebrew, it has been necessary to except such as appear to be of common origin rather than borrowed, such as Caphthor, Caphthorim. The Coptic corresponding letters are the result of an examination of Bunsen's vocabulary, and are placed as far as possible according to the frequency of their occurrence. Common correspondents are written in capitals.

A comparison of the table with what has been previously said respecting the alphabet, will tend to show the general accuracy of those antecedent views; while a careful inspection of it affords indications that there are materials for a more accurate definition of the sound of each letter than we have ventured to give. It should be here remarked that one character is used for the Hebrew ע, and transcribed by that letter, showing that the A had sometimes something of a guttural sound. The use of this very character for the Greek A forbids us, however, to suppose that its sound was more than a slightly guttural A.

Writing.

§ 2. WRITING, OR REPRESENTATION OF SOUNDS BY WRITTEN CHARACTERS.

Various kinds of hieroglyphics.

According to the definition previously given of the hieroglyphics, these characters were delineations of material objects employed to denote real things by figures, ideal things by symbols, or to represent sounds by characters either syllabic or alphabetic. We may divide these signs therefore, into two classes, each subdivided into two kinds.

1.—*Ideographic Signs.*

Fig. 1.

Fig. 2.

1. Iconographic, as (fig. 1), "an obelisk."
2. Symbolic, as (fig. 2), "to strike."

2.—*Phonetic Signs.*

Fig. 1.

Fig. 2.

1. Syllabic, as (fig. 1), "stable, firm," where the first sign may be put for the whole word.
2. Alphabetic, as (fig. 2), Shufu, Sûphis (I.), the name of the second king of the Fourth Dynasty.

It must be observed that the ideographic signs are, though indirectly, no less representations of sounds than the phonetic; also that few signs were used in both classes, or in both kinds of the former class; and that both kinds of the latter class are connected by the syllabic signs being frequently used alphabetically with their proper complement.

Let us examine each of the kinds of hieroglyphics somewhat more minutely. We shall best understand their nature and use by ascertaining for what classes of words they were chiefly employed.

Ideographic signs.

Since everything of which we think may be referred to some one of the categories, and since the ideographic hieroglyphics represent ideas of every kind, they may be conveniently referred to the categories. The ten categories of Aristotle have been separated into two heads, substance and attribute, or accident, the former comprehending the first of these categories, and the latter the remaining nine. It will be seen at once that all the iconographic hieroglyphics stand for real things referrible to the category of substance; and that all the symbolic hieroglyphics, excepting those very few which stand for beings or things which, as ideal, could not be represented but by symbols, are referrible to the categories comprehended under the head of attribute.

Iconographic signs represent, therefore, real things alone, or, grammatically, all substantives which are names of real things, as man, dog, house, country, and the like. There are probably no other substantives in the Egyptian language excepting names of such ideal things as are referrible to the category of substance.

Symbolical signs may be classed in the following manner, the categories being arranged in a grammatical order:—

I. Substance.—Substantives which are names of ideal things referrible to this category; as, "Hades." Personal pronouns; as, "I," "thou."

II. Attribute.
  1. *Quantity.*—Adjectives of number; as, "first."
  2. *Quality.*—Adjectives of quality; as, "good."
  3. *Relation.*—Adjectives of relation; as, "great."

  And verbs and adverbs derived from them.

  4. *Action.*—Adjective verbs (derived).
  5. *Suffering.*—Adjective verbs (derived).
  6. *Collocation.*—Participles of adjective verbs relating to position.
  7. *Place.*—Prepositions and adverbs of place; as, "in," "to," "on high."
  8. *Time.*—Adverbs of time; as, "ever." Prepositions of time; as, "after."
  9. *Possession.*—Possessive pronouns; as, "thy."

Hence it is evident why so few signs are used both in an iconographic and a symbolic sense. It should be observed that particles of place, time, and situation are rarely expressed by symbolical characters, and that when such characters are employed they are symbolico-phonetic.

Phonetic signs.

In the oldest form of the Egyptian language we find very few characters which have an indiscriminate alphabetic use, the greater number of the phonetic signs being only used with a particular alphabetic sign or signs by way of complement to express a syllable. This complement being frequently omitted, the initial sign acquires a syllabic value, standing for a syllable. The two kinds of phonetic characters have therefore no distinction as to signification. They are employed to represent the sounds of the names of things represented by figures and symbols in the other class, as well as some ideas excluded by their nature from that class, like the substantive verb "to be," and almost all particles of place, time, and situation. This phonetic class should be therefore the more comprehensive, since it should contain the sounds of the whole of the signs of the other class with those of words not contained in that class. Of the form of the syllables we shall have to speak more fully hereafter in treating of the roots; but it is here needful to notice an important peculiarity in the mode of writing them, already mentioned.

Place of vowel.

In the case of syllables commencing and ending with a consonant the medial vowel was usually written after the final consonant. Professor Lepsius was the first to suggest that this might be the case in syllables apparently terminating in U in the written characters. Thus the name of the god Chons was written Shnsu (Khnsu), where the position of the vowel is proved by the Greek orthography and that of the Copts in the name of the month Παχων, ⲡⲁⲭⲱⲛⲥ, ⲡⲁϣⲱⲛⲥ. But this principle, which has been recognised as correct with respect to the U vowel, has never been carried out with reference to the others. Notwithstanding, there is abundant evidence to show its wider application. The word for horse is, for example, written HTRA, corresponding to the Coptic ϩⲧⲟ, pl. ϩⲧⲱⲣ, and since it is a root, and therefore monosyllabic, can only be read HTAR or HATR, the former of which forms appears from the Coptic to be the correct one.—As the principle under consideration may be considered to be directly or indirectly admitted with respect to the U vowel in consequence of such instances as that of the name of the god Chons, written SHNSU, but pronounced SHUNS; that of the god Munt, written MNTU; and many others,—it becomes necessary to consider only the A and I vowels. It should be remembered that the admission of a principle of this kind as to one vowel, makes its application, to say the least, highly probable to the other two, the short or inexpressed vowel being necessarily excluded. In order to test the applicability of the principle, several apparently monosyllabic words, mostly roots, were chosen at random from Champollion's *Dictionnaire Egyptien*, and compared with their Coptic equivalents, and the following was the result:—

A.—HNA, "with." Copt. ϧⲉⲛ; *s.* ϩⲛ̄.
MNA, "to come to port, disembark." Copt. ⲙⲟⲛ; *s.* ⲙⲁⲛ. "A port," ⲙⲟⲛⲏ.
MSHA, "to fight, a warrior." Copt. "a fight," ⲙⲓϣⲓ; *s.* ⲙⲓϣⲉ.
SBA, "a flute." Copt. ⲥⲏϥⲓ; *s.* ⲥⲏϥⲉ. "A reed," ⲥⲉⲃⲓ; *s.* ⲥⲏⲃⲉ.
SHRAU, "a son." Copt. ϣⲏⲣⲓ; *s.* ϣⲏⲣⲉ.
SKA, "to labour, to plough." Copt. "to plough," ⲥϫⲓ; *s.* ⲥⲕⲁⲓ.
TSHA, "a stronghold." Copt. *s.* ⲧⲟϣ.
TSHA, "a boundary, frontier." Copt. ⲑⲱϣ; *s.* ⲧⲟϣ.

O these examples seven are in accordance with the supposed principle, and but one (SKA), which may possibly be a derivative form (S-KA), against it. That respecting which some doubt might be entertained, on account of its Coptic correspondents, MNA, may be fairly supposed to have had a medial vowel.

I.—FNTEE, "a worm." Copt. ϥⲉⲛⲧ; *s.* ϥⲛ̄ⲧ, ⲃⲛ̄ⲧ.
HFEE, "a serpent." Copt. ϩⲟϥ, ϩϥⲱ; *s.* ϩⲟⲃ.
HREE, "to terrify, to fear." Copt. ϩⲟⲩⲣ. "Terror," ϩⲉⲗⲓ; *s.* ϩⲏⲗⲏ.
HNBEE, "a fountain." Copt. *s.* ϩⲟⲛⲃⲉ.
HTEE, "a heart." Copt. ϩⲏⲧ, ϩⲑⲏ; *s.* ϩⲧⲏ.
KBEE, "a honeycomb." Copt. ⲕⲉⲃⲓ.
KRMEE, "Carthamus." Copt. ⲕⲣⲁⲙ. "Carthamus silvestris."
NBEE, "to swim." Copt. *s.* ⲛⲉⲉⲃⲉ, ⲛⲏⲏⲃⲉ. "Swimming" (act of), *M.* ⲛⲉⲃⲓ.
NHEE, "a sycamore." Copt. ⲛⲟⲩϩⲓ.
SBTEE, "a wall." Copt. ⲥⲟⲃⲧ.
SHREE, "to, towards." Copt. *s.* ϩⲁⲣⲟ, ϩⲣⲁⲓ; *B.* ϣⲁⲗⲁ, ϣⲁⲣⲁ.
SNTEE, "to found." Copt. "Foundations," ⲥⲉⲛϯ; *s.* ⲥⲉⲛⲧⲉ, ⲥⲩⲛⲧⲉ; *B.* ⲥⲏⲛϯ.
S-SHEE, "writing, to write." Copt. ⲥⲁϧ, ⲥϧⲁⲓ, ⲥϧⲉ, ⲥϧⲏ; *s.* ⲥⲁϩ, ⲥϩⲁⲓ, &c.
STEE, "an arrow." Copt. ⲥⲁϯ; *s.* ⲥⲟⲧⲉ, ⲥⲟⲟⲧⲉ.
T-HAU, "To be intoxicated." Copt. ⲑⲁϧⲓ, ⲑⲓϧⲓ; *s.* ⲧⲁϩⲉ, ϯϩⲉ.
T-HNEE, "the forehead." Copt. *s.* ⲧⲉϩⲛⲉ.
T-HTEE, "lead." Copt. ⲧⲁϩⲧ, ⲧⲁⲧϩ.

Of these instances, eight are in accordance with the proposed principle, and an equal number neither for nor against it, and but one (KBEE) altogether against it.

If we take into consideration the remarkable irregularity of Coptic with respect to the vowels, the circumstance that some monosyllabic roots may have commenced with two consonants and terminated with a vowel, and that among the words given above as monosyllables, some are perhaps dissyllables, we must admit that the medial vowel in hieroglyphic and hieratic writing usually followed the consonant or consonants which it preceded in pronunciation. It would obviously be wrong always to write the vowel which follows the consonants of a monosyllable before one or more of those consonants; and our safest plan, excepting where the sound renders a medial vowel absolutely necessary, will be to endeavour to ascertain from the Coptic whether the vowel in question was final or not, and we shall thus be enabled ultimately to establish something like a general rule as to the position of the vowels. We should remember, however, that the system of writing a language is always more or less irregular with respect to its pronunciation, and that the Egyptians did not endeavour to write their language in such a manner as to facilitate the labours of future discoverers.

Determinatives.

Every word in the Egyptian language doubtless could be written phonetically, and nearly every one could also be represented by a figure or symbol, that is, ideographically. These two systems were combined either accidentally, by the mixture of phonetic and ideographic signs in an inscription or writing, some words being represented in the former manner, others in the latter, or, essentially, by a single word being written in both ways. The former of these modes of combination requires no further explanation, but the latter must be examined in some detail, from its being characteristic of the system, and on account of its value, to which we have already adverted, in facilitating and verifying interpretation.

When a single word was represented both phonetically and ideographically, the ideographic sign was employed as a determinative to determine the sense of the word to which it was attached, whereof in some instances it also represented part of the sound for the whole of which it stood when employed alone.

Determinatives are either initial, medial, or final; either generic or specific; either simply ideographic or both ideographic and phonetic at the same time. The final or affixed determinatives must be first considered, then the initial, and lastly the medial, as this is the order of their importance.

1. *Final Determinatives.*

Final determinatives.

1. Generic determinatives restrict the word which they follow to a generic signification. Thus the representation of the sun restricts the words which it follows to the signification of light, or time, and the representation of a fish restricts the words which it follows to the sense of fish, *i.e.*, some kind of fish, or something abominable. These adjuncts have generally both a primary generic meaning and a secondary; the primary meaning being either literal, as in the latter example, or of a simple tropical character, as in the former, and the secondary meaning being tropical in a

greater or less degree. These signs are also used as specific determinatives, as when the representation of the sun follows its name; and this is doubtless the primitive meaning of every generic determinative, although it cannot always be traced. The generic final determinatives are not numerous.

2. Specific determinatives restrict the word to which they are applied to the signification of a species; thus, the representation of a cat follows the word "male cat," SHAU; that of a particular kind of boat, the name of that boat; and sometimes they serve to distinguish different uses of the same word, as when the word "wa," a boat, is shown to mean a "boat" simply, or a "barge." This is a very numerous division of determinatives.

Final determinatives appear scarcely ever to have any phonetic value when used as such,[1] and they are very rarely so placed as to become initial, and never, as far as is known, medial.

2. *Initial Determinatives.*

Initial determinatives.

These determinatives are distinguished by having a phonetic value and standing for the first letter of the word which they restrict. They are generally limited to a specific signification, since no one of them can be applied to more than a single root. Thus the so-called *crux ansata*, the emblem of life, is the initial letter of the word ANSH (ankh) "living." These determinatives are very rarely employed as final ones, and rarely as medial, and they are not a large class.

3. *Medial Determinatives.*

Medial determinatives.

These determinatives always immediately follow the first letter of a root, and are almost always initial determinatives deprived of their phonetic value, but otherwise they are final determinatives transposed. This class is very limited. Of the former kind we may instance, HEPT (commonly written hotp or hotep), signifying "devoted" or the like.

There are some determinatives which cannot be included in any of these classes. Of these one of the most common is the ring in which royal names are inclosed. It is also found as the final determinative of the word REN, a "name;" and in one of the earliest inscriptions we find its primitive form, that of a signet-ring (which appears to have been elongated in order to comprehend in it the characters composing royal names), as the determinative of a king's name.[2]

Determinatives, being properly ideographic signs, are either iconographic or symbolic, or both, as may be seen by the examples mentioned above. It will not be necessary to speak of these signs more in detail, since they must be again noticed when we come to consider the different parts of speech.

Words.

§ 3.—WORDS.

Roots.

In a language of so primitive a character as the Egyptian, it is especially needful to endeavour to ascertain the characteristics of the roots. One thing is certain respecting them, that they are always monosyllabic, except perhaps in some names imitative of sound; and this is an essential peculiarity of the language which is of the highest importance. They are either uniliteral, biliteral, triliteral, or quadriliteral, and each class has several forms, as may be seen by the following examples; unusual forms being denoted by an asterisk (*).

I. *Uniliteral*—
  * Vowel A (Affixed pronoun), "Me," &c.

II. *Biliteral*—
  1. Consonant and vowel. BA, "a goat."
  2. Vowel and consonant. AW "to be;" UN, id.

III. *Triliteral*—
  1. Consonant, vowel, and consonant. MEN (inexpr. vowel), "to establish."
  *2. Consonant, consonant, and vowel. SNA, "to bend."
  3. Vowel, consonant, and consonant. ART, "milk."

IV. *Quadriliteral*—
  * 1. Consonant, cons., vow., and cons. PTEH, "Ptah," Vulcan.
  2. Consonant, vow., cons., and cons. SHUNS, Chons.

It is not probable that there are any quinquiliteral roots. Of the preceding forms the most common, and those from which most derivatives are taken, are the biliteral and the triliteral having a medial vowel. The vowel of the former is generally long when the consonant precedes and short when it follows, and that of the latter is generally short, if we may judge from Coptic and analogically. The following may be given as the order of the forms according to the number of words belonging to each, the consonant being denoted by "C," and the vowel by "V."

1. CV.	2. CVC.	3. VC.	4. VCC.
5. CVCC.	6. CCVC.	7. CCV.	8. V.

It would lead us beyond the province of the present article were we to endeavour to ascertain the meanings of the various forms, or whether they had originally peculiar meanings, but it should be remarked that certain roots are imitative, representing things by their sounds. Thus the names of animals are taken in many instances from their cries, and the like is the case with some words descriptive of noises. This is the hieroglyphic method brought before the mind through the ear instead of the eye.

Derivatives.

Derivatives are formed in five ways, by changing the vowel, by increasing the word at its commencement, by increasing the word at its end, by reduplication, and by agglutination.

I. *Change of vowel.*—MAN, "to come to port," from MEN, "to establish."

II. *Increase at commencement*—
  1. MA, place. MA-ANSHU, "the abode of the living" (pl.)
  2. S, Causation. S-ANSH, "to cause to live" (and other verbal forms to be noticed subsequently).

III. *Increase at end*—
  1. EE;—*a.* Belonging to. AMENEE, Ἀμμώνιος, pr. n.
    b. Verbal form, usually participial. MEREE, "beloved," from MER, "to love."
    c. Substantive result of action of verb. S-SHEE, "a writing, the writing" (*i.e.*, a a thing written), from S-SHAU, "to write." HAY, "a stela" (*i.e.*, a thing set up), from HA, "to set up."
  2. U, abstract noun from verb. HAU, "duration," from HA, "to set up," "establish."
  3. NU, added to some words ending in N for the sake of euphony, as BEN-NU, "the Phœnix."

---

[1] There are possible exceptions to this rule, as perhaps the word AB "to be thirsty, thirst," which would seem to have been pronounced AB-NUN, for it is rendered as the name of a Shepherd-king, the third sovereign of the Fifteenth Dynasty, Ἀπαχνὰς (Man. Jos.) Παχνὰν (Man. Afr.); but the Coptic equivalent is ⲓⲃⲓ, &c. There are also determinatives of sound, not of sense.

[2] *Modern Egypt and Thebes*, vol. i., p. 368.

4. SU, added to some words ending in S for the sake of euphony, as MES-SU, "born."

Besides these there are the inflectional terminations, which must be noticed in another place.

IV. *Reduplication*—

- *a.* Augmentative, as TEN-TEN, "to revolt," from TEN, "to raise one's self."
- *b.* Frequentative, as TEF-TEF, "to drip."
- *c.* Imitative of the cries of animals, &c., as KA-KA, "to cackle;" SEN-SEN, a kind of heron.

V. *Agglutination*—

1. Two substantives. SUTEN-SA (king's son), "prince."
2. Substantive and epithet. MEN-NUFR (good abode), "Memphis."
3. Verb and substantive. HAS-SBA, "a flute-player," from HAS, "to play," and SBA, "a flute."
4. Preposition and substantive. EM-HA, "in front."
5. Preposition and adverb. ER-TET (?), "for ever."

hanges in ronunciation.

The changes in pronunciation must here be noticed, and, first, the contractions.

The euphonic terminations NU and SU were frequently omitted, as we may conclude from their being often left out in the inscriptions, and from the correspondence of the words to which they were applied to their Coptic forms.

The letter R or L was frequently dropped at the end of a monosyllable. The cause of this elision was the weak sound which this letter had with the Egyptians, as is alone evident from its representing both R and L. The words HER, KER, HUR, and MER were not only written HA, KA, HU, and MA, but so pronounced, as is proved by each of them being written in both manners in Coptic as well as in hieroglyphics. The English and German pronunciation of the final R is an exactly parallel case. It does not seem possible, however, to determine by any rules what was the practice of the ancient Egyptians, nor do the inscriptions afford us a safe guide, since we cannot prove that the abbreviated form indicates in all cases an abbreviated pronunciation. Euphony, combined with ancient transcriptions, will be our safest guide. Thus we find MEREE-AMEN or MER-AMEN transcribed Μιαμμοῦ (Μιαμμουν?), and euphony points out MEE-AMEN as the ancient pronunciation. So, too, with MEE-RA, Μοῖρις. By this discovery we have been enabled to settle more than one difficulty. The word, for example, usually written with a beetle and mouth, was known to signify "transmigration" or "transformation," as constantly in the Ritual (Lepsius, *Todtenbuch*, ch. lxxvi., and *passim*), and its sound was generally held, and for good reasons, to be TAR or TER. For this no equivalent had been discovered in the Coptic. But if we admit the rule given above, we find the corresponding word in ⲦⲞⲨ, *transmutare*.

With respect to transpositions, it is very difficult to judge, since the letters of a word were generally written in the same order, whether that were the order of pronunciation or not. There is, however, some evidence to show that both consonants and vowels were transposed. For example, the name of the crocodile is written MSHU, MSUH, and HMSU, and in Coptic ⲙ̀ⲥⲁϩ, *s.* ⲉⲙⲥⲁϩ, and by Herodotus *χάμψαι* is given as the Egyptian name for crocodiles. Hence it seems that transpositions in writing indicate differences of pronunciation no less than does the omission of the final R, in many instances at least. It is evident that in the most ancient mode of writing transpositions were more numerous than afterwards, as we may see by comparing the inscriptions in the tombs of the time of the Fourth Dynasty near the Great Pyramid, with those of monuments of the Eighteenth Dynasty. The names of the gods, which we find to have continued unchanged until the latest period at which hieroglyphics were used, and which therefore we may conclude to have been preserved from the beginning of hieroglyphic writing, are most remarkable for the transposed mode in which their characters are arranged. That of Osiris, for example, is usually written AR-HES, though pronounced HES-AR; and that of Nephthys, either NEBT-EE or EE-NEBT. Religious reasons, perhaps, had somewhat to do with these transpositions, as with the adjectives "divine" and "royal," which preceded in writing the names to which they were applied, contrary to the use of the language, to which the exceptions are very rare. The word "Ra," "the sun," again, in royal names always occupies the first place, whether pronounced at the beginning of the name or not, thus Shaf-ra is written RA-SHAF; and Men-kura, RA-MEN-KU.

Doubled letters.

It is important to notice that doubled letters were expressed, though they seem to have been almost confined to foreign words, except when the addition of the terminations NU and SU rendered the final letters N and S double. Of foreign names we may instance that of an African nation or country, TEKRERR;[1] and that of the Ionians, HAUNENN or HAUNNEN, also written HAUNEN and thus showing that the reduplication was not always expressed.

Expletive sign.

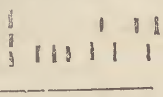
Certain signs have been concluded to be expletives used merely to fill up a gap in a group of characters, whether in the middle or at the end of a word. Champollion enumerated several of these, but some of them are determinatives, and but one certainly an expletive. This is the papyrus-roll, which follows substantives, adjectives, verbs, and prepositions; and some of these, such as NA, "great," MEH, "to fill, full," almost always; it cannot, therefore, be anything but a mere expletive, as Champollion concluded it to be. Bunsen has indeed assigned to it two uses, for he calls it a "period at end of sentences," and "the hieroglyphical *stop* or end of a group," making it thus a simple division and a stop. Its constant employment after particular words, in the midst of some words, and where no stop is admissible, affords a positive disproof of these definitions, which seem, though somewhat obscure, to contradict one another.

Parts of speech.

The section of grammar relating to the parts of speech has next to be considered, and this may be conveniently divided into what relates to inflected and what to non-inflected words. It must not be supposed, however, that any words were in themselves capable of inflexion, for the language was not in that sense susceptible of inflexion, but the ideas of number, gender, and person were added to a word by prefixes or suffixes, and the reception or non-reception of these signs of inflexion is what constitutes the great divisions into which we may separate the etymology of the Egyptian language. The most convenient order, with reference to inflected words, will be to examine the article first, then the pronoun, then the noun in its two kinds of substantive and adjective, and, lastly, the verb.

Signs of gender and number.

Before speaking of the article, it is necessary to mention the signs of the singular, masculine and feminine, and of the plural, more especially as one of these has been confounded with the article. The sign of the masculine singular is a single vertical line  which is properly the sign of the singular only. The singular feminine is distinguished by the character . Both appear to have been used as determinatives, though they sometimes represented sounds, the former the sound *a* and the latter *t*. We find the latter retained in many Coptic words at the commencement or the end, though in others it is omitted, while for the former there is no certain equivalent. The plural is denoted by three vertical lines variously disposed, and sometimes with the fem. sign prefixed. All these signs are therefore to



---

[1] The modern name Tekroor, pl. Takarneh.

be regarded as determinatives, and that of the feminine as sometimes indicating a feminine form either commencing or terminating with *t*. It is important to observe that there is evidence to show that this feminine form existed in both varieties in the ancient language no less than in the Coptic. As, however, it is almost always suffixed in the hieroglyphic writing, we cannot determine its position, and must be content to place it after the word, as it seems to have been most generally pronounced as well as placed.

Article. The article PA, PEE, "the," was thus declined:—

Sing. Masc. PA, PEE; *F.* TA; *Plur. Com.* NA, "The."

It was prefixed to nouns, as TA-MEN.T, "the swallow" (in which group we find the termination T as well as the article, proving that the two were distinct, and that both cannot be articles); NA-NEBU, "the lords."

Pronouns. The pronouns we must now consider. In the tables, as in those of the verbs, the method of arrangement usually adopted in grammars of Semitic languages has been here followed, as in these parts of grammar the Egyptian most resembles the languages of that class.

Personal.

ISOLATED PERSONAL PRONOUNS.

Singular.		Plural.	
3. *M.* ENTUF,	He.	3. *C.* ENTESEN, SEN	They.
F. ENTUS,	She.		
2. *M.* ENTEK,	Thou (*m.*)	2. *C.* ENTUTEN, EMTUTEN	You.
F. ENTA,	Thou (*f.*)		
1. *C.* ANEK, NAK	I.	1. *C.* (?)	We.

AFFIXED PERSONAL PRONOUNS.

Singular.		Plural.	
3. *M.*—EF,—U	Him.	3. *C.* —SEN	Them.
F.—ES	Her.		
2. *M.*—EK	Thee (*m.*)	2. *C.* —TEN	Ye.
F.—ET	Thee (*f.*)		
1. *C.*—A	Me	1. *C.* —EN	Us.

It is to be observed that when the ideographic signs for the affixed pronouns of the first person singular are employed that person becomes necessarily masculine or feminine. As, however, it has but one sound, the person remains common though bearing this indication of a distinction of gender. The same must be remarked of the pronominal affixes of verbs for this person. These pronouns are likewise used as possessive pronouns without agreeing with the gender and number of the thing possessed, and to indicate the persons of verbs.

Possessive.

POSSESSIVE PRONOUNS.

Third Person. Object masc., person spoken of masc.	*Sing.*	PAEEF, PUEEF, PEEF, PAF	His (*m.*)	ὁ αὐτοῦ
Object fem., person spoken of masc.	*Sing.*	TAEEF, TUEEF, TEEF, TAF	His (*f.*)	ἡ αὐτοῦ
Object masc., person spoken of fem.	*Sing.*	PAEES, PUEES, PEES, PAS	Her (*m.*)	ὁ αὐτῆς
Object fem., person spoken of fem.	*Sing.*	TAEES, TUEES, TEES, TAS	Her (*f.*)	ἡ αὐτῆς
Object masc., persons spoken of com.	*Plur.*	PAEESEN, PEESEN, PASEN, PAYU	Their (*m.*)	ὁ αὐτῶν
Object fem., persons spoken of com.	*Plur.*	TAEESEN, TUEESEN, TEESEN, TASEN	Their (*f.*)	ἡ αὐτῶν
Objects com., person spoken of masc.	*Plur.*	NAEEF, NAF	His (*pl. c.*)	οἱ ϗ αἱ αὐτοῦ
Objects com., person spoken of fem.	*Plur.*	NAEES, NEES, NAS	Her (*pl. c.*)	οἱ ϗ αἱ αὐτῆς
Objects com., persons spoken of com.	*Plur.*	NAEESEN, NEESEN, NASEN	Their (*pl. c.*)	οἱ ϗ αἱ αὐτῶν
Second Person. Object masc., person spoken to masc.	*Sing.*	PAEEK, PUEEK, PEEK, PAK	Thy (*m.*)	ὁ σοῦ (*m.*)
Object fem., person spoken to masc.	*Sing.*	TAEEK, TEEK, TAK	Thy (*f.*)	ἡ σοῦ (*m.*)
Object masc., person spoken to fem.	*Sing.*	PAEET, PUEET, PEET, PAT	Thy (*m.*)	ὁ σοῦ (*f.*)
Object fem., person spoken to fem.	*Sing.*	TAEET, TUEET, TEET, TAT	Thy (*f.*)	ἡ σοῦ (*f.*)
Object masc., persons spoken to com.	*Plur.*	PEETEN, PATEN	Your (*m.*)	ὁ ὑμῶν
Object fem., persons spoken to com.	*Plur.*	TAEETEN, TEETEN, TATEN	Your (*f.*)	ἡ ὑμῶν
Objects com., person spoken to masc.	*Plur.*	NAEEK, NEEK, NAK	Thy	οἱ ϗ αἱ σοῦ
Objects com., person spoken to fem.	*Plur.*	NAEET, NEET, NAT	Thy	οἱ ϗ αἱ σοῦ (*m.*)
Objects com., persons spoken to com.	*Plur.*	NAEETEN, NATEN	Your	οἱ ϗ αἱ ὑμῶν (*f.*)
First Person. Object masc., person speaking com.	*Sing.*	PAYA, PUYA, PEEA, PAÄ	My (*m.*)	ὁ μοῦ
Object fem., person speaking com.	*Sing.*	TAYA, TUYA, TEEA, TAÄ	My (*f.*)	ἡ μοῦ
Object masc., persons speaking com.	*Plur.*	PEEEN, PAEN	Our (*m.*)	ὁ ἡμῶν
Object fem., persons speaking com.	*Plur.*	TAYEN, TEEËN, TAEN	Our (*f.*)	ἡ ἡμῶν
Objects com., person speaking com.	*Plur.*	NAYA, NAÄ	My	οἱ ϗ αἱ μοῦ
Objects com., persons speaking com.	*Plur.*	NAYEN	Our	οἱ ϗ αἱ ἡμῶν

Demonstrative.

SHET-NEB	All others, everything else.
UN-NEB, UN-NEBU	Each being, each one, each thing.

Nouns. We now come to the consideration of nouns, whether substantives or adjectives.

Substantives.

The greater number of pure substantives, as before suggested, in Egyptian seem to have been names of real things, the names of ideal things being in that language essentially adjectives or verbs, which classes of words were nearly allied; at least this seems the most probable opinion. Such words as "cat," "horse," "tree," and proper names, which are logically of the same class, are undoubted substantives; while, on the other hand, "life," "goodness," or "good," and the like, are almost certainly, in a rude language like the Egyptian, primarily adjectives; for "life" is "the state of living," spoken of a person; "goodness," "the state of being good," except among those who can comprehend the abstract notion of "life" and "goodness."

The determinatives of substantives are necessarily very numerous. Some specimens are given below, arranged under their different classes and kinds.

Generic determinatives.

I. Generic Determinatives.

FINAL.

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 1. (Representation of the sun.) 1. Light, as UBEN, "light, to shine." 2. Time, as HARU, "day;" KURH, "night;" HEEB, "a panegyry," periodical celebration.

Fig. 2. (Repr. of skin of some animal.) 1. Quadrupeds (including quadrumana), as SHAU, "a male cat;" HTAR, "a horse," and proper name of a man, in which latter case it is followed by a second determinative, the ordinary one of proper names of men. 2. Things made of leather, as TEB, "a sandal;" SHENR, "a helmet."

Fig. 3. (Repr. of water.) 1. Sea, river, lake, and the like, as YUMA, "the sea;" ARU, "a river." 2. Proper names of the same, as . . . URT-MU, "the Mediterranean;" Hapee-mu, "the Nile." 3. Fluids, besides water, as SNEF, "blood." 4. Actions and feelings connected with water and other fluids, as AB, "thirst, to be thirsty."

Specific determinatives.

II. Specific Determinatives.

1. FINAL.

A. *Generic, in their Primary use, as Specific.*

Fig. 1. (Representation of the sun.) Ra, "the sun."

Fig. 2. (Repr. of skin of some animal.) Bes, a "hide" or "skin."

B. *Specific.*

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

Fig. 1. (Figure of Amen.) Amen, "Jupiter-Ammon," the god of Thebes.

Fig. 2. (Repr. of ears.) Mester, "the ears."

Fig. 3. (Repr. of bee.) Sheb, "a bee."

Fig. 4. (Repr. of bow.) Peet, 1. "a bow." 2. Followed by numerals for 9, the "Nine Bows," a nomadic people, bordering on the Egyptians.

2. INITIAL.

Fig. 5.

Fig. 6.

Fig. 5. (Repr. of a hatchet.) Neter, a god.

Fig. 6. (Repr. of an ear of corn.) Betee, corn.

From these examples, compared with what has been before said on the subject of determinatives generally, it will not be difficult to comprehend the use of these signs as applied to substantives. The examples, it should be added, have been chosen with a view to illustrating the use of determinatives, for instance, by showing, that all those which are generic had in many instances, and probably originally in all, a primary specific use.

Number and gender.

In Egyptian, as in Coptic, there are but two numbers, the singular and the plural, for the dual was not known to that language. Bunsen, indeed, has assigned to it a dual, contrary to the opinion of Champollion, but his view is disproved by the facts—(1.) that the usual so-called sign of the dual is not strictly analogous to those of the singular and plural; (2.) that it follows in some instances a plural termination; (3.) that it is occasionally employed as a simple termination without implying duality, whereas the sign of the plural is never so used, and that of the singular apparently never without retaining its signification of unity, and certainly never in opposition to that signification; and (4.) that the dual number does not exist in the Coptic language. It is easy to perceive how this mistake has arisen, for duality could only be represented where ideographic signs were simply employed without the addition of numerals by the doubling of a sign (as in Spec. Det. 2, *supra*), and thus occupying a place between the singular and the plural, this form was naturally mistaken for a dual.

The singular of substantives is indicated by an ideographic or phonetic sign or word being written singly, or by the addition of the signs previously mentioned of the singular masculine and feminine. The plural is analogically indicated, but, from the nature of the case, in several manners. In both numbers there are two genders, the masculine and the feminine; the former being indicated by the sign of the masculine, whether singular or plural; the latter by the feminine sign alone, or added to the masculine plural, except when the gender is denoted by the determinative, in which case that sign is not always employed.

The plural was indicated—(1.) by trebling ideographic signs; (2.) by trebling a phonetic word; (3.) by trebling the second and third signs of a triliteral phonetic word; (4.) by adding the sign of the plural, three vertical lines; (5.) by adding the termination U (or OO), to ideographic or phonetic words (by preference to the latter), whatever were their sound, excepting those ending in N, which take the termination YU (or YOO); (6.) by adding the sign of the plural to the trebled ideographic or phonetic word; (7.) by adding the sign of the plural to the terminations U and YU. The sign of the feminine is also retained in the plural.

Adjectives.

Nouns adjective are declined in the same manner as nouns substantive. They differ from them grammatically as to their determinatives principally, which will be noticed with those of the verbs. Most of the adjectives are indeed also verbs, the radical signification being the adjective one, since there is properly but one verb, the substantive; but as in use the adjective held a secondary place to the verb, being a kind of verbal noun, the verb is grammatically the more important.

Verbs.

Substantive verbs.

The substantive verb is represented by at least three words:—1. Au, or AW, "to be," both declinable and indeclinable. In the latter form it is used as the copula, and becomes a conjunction, and it also is used as a preposition. 2. Un, "to be," "to exist," both declinable and indeclinable. 3. Ar, "to be," indeclinable, placed at the head of a proposition, and representing the 3d persons singular and plural of the present, as well as the infinitive. This also becomes a preposition. To these Bunsen adds a fourth, PA, PU, PUI, TUI, which he inaccurately conjectures to be perhaps merely a pronoun. We must add to these the kindred formative TU, which is certainly a form of the substantive verb. From it have originated forms of the substantive verb in Coptic, ⲠⲈ, ⲦⲈ, and doubtless the plural ⲚⲈ, of which last we have to find the original. Perhaps one or more of the signs of tense besides AU may be considered to be forms of the substantive verb.

Adjective verbs.

Adjective verbs are distinguished by their determinatives, which are symbolical signs, very rarely used in their primary signification to restrict substantives. Their general character may be seen by the following examples:—

Generic determinatives.

I. Generic Determinatives.

FINAL.

Fig. 1.

Fig. 2.

Fig. 1. (A sword). 1. Cutting, as HESK, "to cut;" SKA, "to labour." 2. Division, as TUM, "to separate, distinguish, make to distinguish, cause to know." 3. Tropically, negation, TUM, "not to be." 4. Wounding, as SMAM, "to accuse."

Fig. 2. (Two legs walking). 1. Locomotion, as YA, "to come, to go;" SHENS, "to hunt, to fish." 2. The result of locomotion, as HER, "to appear." 3. Motion, as PSESH, "to extend;" HA, "to place, to set up."

Specific determinatives.

II. Specific Determinatives.

1. FINAL.

A. *Generic, in their primary use when applied to adjective verbs, as Specific.*

It is scarcely possible to determine the primary use of the determinatives of adjective verbs as such, on account of their being tropically employed. Sometimes there seems little doubt, as in the case of the second of those cited under the previous class, the primary use of which as applied to adjective verbs, is almost certainly to restrict the verb YA, "to come" or "go." It is, however, so difficult to trace this use, that the safest plan is to class the word or words which seem to show it under the first head of examples of the employment of a sign as a generic determinative.

B. *Specific.*

Fig. 1.

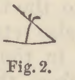

Fig. 2.

Fig. 3.

Fig. 4.

Fig. 1. (A man wrapped in his dress.) AMEN, "to envelop, cover;" the root of the name of the god Amen.

Fig. 2. (A hoe.) SKA, "to labour."

Fig. 3. (An Egyptian holding an Asiatic prisoner.) SHETB, "to subdue."

Fig. 4. (A cynocephalus.) KANT, "to be enraged."

2. INITIAL.

Fig. 1.

Fig. 2.

Fig. 1. (Crux ansata.) ANSH, "to live (life)."

Fig. 2. (Two legs united to the initial letter.) YEE or AY, a form of YA, "to come, go." (This group is sometimes remarkable for the repetition of the determinative.)

Forms of verbs.

There are several forms of adjective verbs, each of which may comprehend one or more kinds. They may be arranged as below, according to our present knowledge of the ancient Egyptian language. It should be remembered, however, that our incomplete acquaintance with the words of that language, both as to their number, and as to the manner in which they were written, renders the inquiry into a matter of this kind extremely difficult, and its result in many respects only approximative. Nevertheless, most of the particulars are proved by satisfactory examples to be entirely correct, and these are therefore distinguished by an asterisk (*). These examples are not all of verbs, because in some of the rarer formations one is compelled to have recourse to other parts of speech; this, however, does not weaken the cases in question, if we consider the character of the language. Care must be taken to distinguish verbs in forms from compound verbs, and these last again from verbs in juxtaposition with other words, but not composition. In the case of verbal forms they are mostly produced by separable or inseparable prefixes, respecting the former of which there can alone be doubt. When separately employed, however, these prefixes are either followed by a preposition or written under a different form, of which their prefix form is a contraction or simplification. The compound verbs are again to be distinguished from those simply in juxtaposition by the position of the pronominal terminations indicating the person, for these follow the whole group in the case of a compound verb, whereas they immediately follow the simple verb when it is not compounded with the word which it precedes. The following, then, are the principal forms:—

A. *Monosyllabic Forms.*

Sometimes the second and third of these forms appear to be derivatives.

* 1. With A, or inexpressed vowel.
* 2. With EE.
* 3. With U.

B. *Derivative Forms.*

* 1. Reduplicate, *frequentative* and *augmentative.*
* 2. S prefixed, *causative.*
3. H prefixed, *intensitive* and verb of action of substantive root.
4. T prefixed, *donative.*

Declension of verb.—Infinitive noun.

The root of the verb is the infinitive noun, a verbal noun which expresses what we should term the abstract notion of the meaning conveyed by the verb, and is the only part of an adjective verb which does not require the assistance, either expressed or understood, of the substantive verb. It may be best rendered the act of doing or condition of being, as MAR, "the condition of loving," &c. It must be carefully distinguished from the infinitive mood, which requires a prefixed preposition.

Indicative mood.—Aorist.

INDICATIVE MOOD.

Aorist.

Sing. 3. *M.*—EF, F.	2.—EK, K.	1. *C.*—A.
F.—ES, S.	—ET, T.	
Plur. 3. *C.*—SEN.	2.—TEN.	1. —EN.

This tense is formed by adding the affixed personal pronouns to the root of the verb. A more complex form is made by placing the particle KU between the root and the pronoun of the first person.

Although this tense has been usually denominated "the present," it has been judged best to call it the aorist, since it is susceptible of three meanings, corresponding to those of our present, imperfect, and preterite, as will appear from the examples given in the chapter on construction.

The past is formed by prefixing the characteristic N to the affixed personal pronouns.

Past.

Past.

Sing. 3. *M.*—NEF.	2. 1.—NEK.	1. *C.*—NA.
F.—NES.	—NET.	
Plur. 3. *C.*—NESEN.	2.—NETEN.	1. —NEN.

The signification of this tense is usually that of the past alone, though it has sometimes both a pluperfect and an emphatic present sense, in the latter case implying a past one. It may generally be best rendered by the compound form, "I have done thus," than by the simple past; so that it is better to read "I have loved" than "I loved," for the latter form would be more usually found to correspond to the aorist.

The future is formed by prefixing the substantive verb AU, generally with the addition of the preposition ER, to the infinitive of the verb to which it is desired to give a future signification.

Future.

Future.

	3.	2.	1.
Sing.	*M.* AUF-ER.—	AUK-ER.—	*C.* AWA-ER.—
	F. AUS-ER.—	AUT-ER.—	
Plur.	*C.* AUSEN-ER.—	AUTEN-ER.—	AWEN-ER.—

Chevalier Bunsen and M. de Rougé suppose that the preposition may be omitted, and the latter has even gone so far as to constitute of this supposed form a new future unknown to Champollion. This opinion has been caused by the circumstance that the R, as we have shown in the present essay, was sometimes omitted in writing no less than in speaking by the ancient Egyptians, while the vowel that preceded it was retained. When, however, the vowel preceding the R was that which was never expressed, it became impossible to indicate that it was not dropped with the consonant following it. This inexpressed vowel is that which forms part of the preposition ER, and therefore when the consonant of that preposition is omitted in writing the future the whole particle appears to be omitted. The formation of the Coptic futures remarkably corroborates this opinion, for they retain the ρ in some persons, but reject it in others.

M. de Rougé has noticed another form of future commencing with TU immediately prefixed to the root without an intervening particle, but with marks of tense following the root: thus, TU-RESH-KU-A ("I will invoke?") He is evidently correct in supposing this to be a form of the substantive verb, like AU, as we have already seen to be the case.

Optative mood.

The optative mood is known only in the aorist. This tense is formed by prefixing the syllable MAY to the aorist of the indicative; as, MAY-YA, "that I may go."

Imperative mood.

The imperative mood, which is likewise known only in the aorist, is formed by prefixing the syllable MA to the aorist of the indicative. The close similarity to the prefix of the optative is what one would reasonably expect from the affinity of the two moods.

Infinitive mood.

The infinitive mood is formed by prefixing ER and other particles to the infinitive noun or root of the verb, with which it should not be confounded.

Active participle.

The participles are formed from the root by the addition of a prefix or suffixes. The active participle is formed—(1.) by prefixing ENT, ENTEN, "he who," to the root; or (2.) by adding to it TA or T; or (3.) lastly, by adding to it the pronominal affixes of the third person singular, EF (*m.*), ES (*f.*), and U, not SEN, as their plural common.

Passive participle.

The passive participle is remarkable as being the only form in which the passive voice is found in the ancient Egyptian expressed by a peculiar inflection. It is formed by the addition to the root of UT or TU, sometimes prefixed, but almost always affixed, for both numbers and genders; and by its aid a construction arises which must be called the aorist of the passive. This is formed by the addition of the pronominal suffixes to the participle past; as ASTU *MESTUF* EM RENP XXI,[1] "Behold he was born in the year 21," where the aorist is used with an imperfect signification. It has been supposed that the derivative form terminating in EE is a passive participle; but this seems rather to be a separate form of the verb, having significations that would naturally lead to its being usually employed in a participial sense, both as an active and as a passive participle.

Negative form.

All verbs assume a negative signification by receiving the prefixes NEN or ENTEM, as in the following example from the negative confession in the *Ritual*:—NEN-ART-A AMAM HATA,[2] "I have not eaten my heart"—*i.e.*, repented; meaning, I have had no reason to repent, I have not committed anything to cause repentance; where it may be noticed that the aorist is used for the perfect.

Very frequently do we find the root of the verb employed without mark of tense, number, or person, in the signification of every one of the tenses spoken of above, and for both the participles; but this use is chiefly confined to the sculptured inscriptions of the temples, where the scribes have aimed at a contracted mode of writing; and we do not find frequent instances of it in the papyri. The general sense of the inscription in which the root is thus employed without inflexion enables us to supply the omission.

Respecting the non-inflected words, prepositions, adverbs, conjunctions, and interjections, little need be said, for they can be learned from vocabularies, and their use will appear from the syntax.

Prepositions.

Prepositions are both simple and compound, the compound ones being formed by the addition of a noun; as HER-KER or HA-KA, "above, before," literally "above the head." They are joined with the affixed pronouns when they are used in relation to a person, as NER-SEN, "above them."

Adverbs.

Adverbs are in like manner both simple and compound, the compound ones being usually formed by the union of two nouns, a preposition and adverb, of two adverbs, &c.

Conjunctions.

Conjunctions are also simple or compound, but the compound ones hitherto discovered are but two, HAR-ENTEE (above which?) "because," and KAR-ENTEE (below which?) 'therefore." Among the simple conjunctions AU is remarkable as being identical with one of the forms of the substantive verb; and it is to be observed that its manifest correspondence with the Hebrew ו seems to lend support to the supposition that the latter is etymologically connected with the substantive verb היה. Having thus sketched the main features of the orthography and etymology of the Egyptian language, it only remains for us to notice some of the principles of its syntax.

§ 4.—CONSTRUCTION.

Construction.

It has been observed in an earlier part of this article that it has been denied that there was any syntax to the Coptic language, syntax being here used in a very limited sense to denote the part of grammar relating to idiomatic uses, and the same opinion appears to have prevailed respecting its ancient form, the Egyptian; for no one has yet attempted to give any account of the syntax of the latter. The deficiencies of this portion of the present essay are therefore in some measure excusable, not only as there is no previous work, but because of the imperfect knowledge of the language. It is also difficult at this distance of time so completely to master the modes of thought of the Egyptians of the Pharaonic period, as to be able to discriminate the more delicate of the idiomatic forms of expression, and to ascertain their origin. Nevertheless the simplicity of the language, and its similarity to the Coptic, tend to lessen these difficulties, and to embolden us to hope that some general principles of syntax may be indicated.

[2] *L. T.*, c. cxxv., 27.

Characteristics of Egyptian literature.

First of all, it will be necessary to give a short sketch of the literature of the ancient Egyptians, since much that must be included in the province of syntax may be the result of the peculiar forms it took. In this place the literary records must be considered as to form and matter, and divided into graven and written.

Such remains of the ancient Egyptian literature as have come down to us are either historical or religious; for those that cannot be referred to these classes are so very few as only to afford exceptions to general rules in their subjects, and to indicate to us that the same system of composition runs through the entire body of records. The substance of the historical and religious inscriptions is, however, remarkably different; for the former, although religious in feeling, are devoid of the peculiar mysticism which characterizes most of the latter. The historical inscriptions are records of the successes of the kings, in explanations (often very short) accompanying the historical scenes on the walls of the temples: the religious inscriptions are extracts from the great *Ritual*, or explanatory inscriptions like those of the former class. The historical papyri are panegyrics of the sovereigns recording their successes in war, and notes of current events made by the scribes of the palace-temples: the religious papyri mostly comprehend the whole or parts of the great *Ritual* before mentioned. Of those inscriptions which cannot be classed as either historical or religious, we may particularly mention the explanatory ones accompanying the scenes illustrative of manners and customs which adorn the walls of the tombs of private persons. Referring to other works for some account of the subjects and characteristics of these various records in more detail, it is only needful here to consider them in their relation to our present subject. In the religious inscriptions particularly, and more or less throughout the whole literature, there runs a superstitious conservatism, which has doubtless caused words otherwise obsolete, and characters of an earlier usage, to be constantly retained. The explanatory inscriptions, whether religious, or historical, or simply civil, must be regarded as merely complemental to the scenes which they were meant to explain; and he who should take any one of these inscriptions, and judge it by the rules applied to a quotation from a classical author, would be as unjust as he who should read the short sentences or single words that occur in the illuminations of mediæval manuscripts as connected or complete records. It should be noticed also, that in the sculptured inscriptions much was sacrificed to appearance, and, as has been before remarked, ideographic signs therefore preferred to phonetic, as well as particles and marks of tense omitted. Where this is plainly he case it is folly to cite as an example of peculiar construction what is merely an accidental result of this desire to adopt the most decorative characters; but there are instances on which it is difficult to form a decided opinion.

1. *Propositions.*

Propositions.

As to propositions, nothing need be noticed except the use of the copula. The copula in Egyptian is denoted after a Semitic method, as well as in the Indo-European manner; so that one could write "man he great," or "man is great." Hence it might be argued that the language had a double origin, but it should be remembered that in this instance the pronominal affixed termination of the so-called Iranian copula is a Semitic word, the same which is employed for the other copula. It may, indeed, be replied that the probable indication of an Iranian impression yet remains, although it has taken a Semitic form; and it must be confessed that this reasoning is not without its force, nevertheless it is best to base the theory of the origin of the language on more convincing evidence.

2. *The Article.*

Syntax of the article

The article was prefixed to substantives to determine their application to a particular individual or individuals, but most commonly to express a remarkable distinction between the individual spoken of and all others of the same class:—Thus we read *PE*-NEB EN KAM,[1] "*the* lord of Egypt;" AU-NAK *PE*-HEKA,[2] "adorations to thee *the* king." So, too, we find such royal names as *TA*-USERT,[3] "*the* director" (f.),[4] and *P*-SA-MUT, "*the* son of Mut,"—Psammuthis.[5] The article is thus especially used in the names of countries, places, and peoples; as *PE*-MUEE, "*the* City of the Lion,"[6]—Leontopolis. It was also employed as a simple determinative article; thus, *PE*-TU-N SHETA *PE*-TU-N NEHEEREN,[7] "*the* land of Sheta, *the* land of Neheeren" (Aram-Naharaim,[8] Mesopotamia). From the Coptic we might conclude that this use was very common, but we must remember that the Copts mainly supplied the old marks of gender and number by the definite article, as well as by the indefinite. The emphatic use is too frequent in the inscriptions and papyri not to have been universal in the language; but with this simple determinative use the contrary is the case in the written language, and therefore probably was also in the spoken.

3. *Pronouns.*

Pronouns.

The isolated personal pronouns are very rarely employed; so rarely that Chev. Bunsen does not give that of the first person plural in his *Egypt's Place*, not believing that an instance of its use has been found in the Egyptian records.[9] These pronouns are indeed used very much as were the personal pronouns in the nominative in Latin, for example in the following passage: TET EN-SEN AN HAN-F *ENTUTEN*[10] ASH[11] TATSEN TUEN[12] ER PE-SHER-EN-SHETA[13] "Speech to them of his holiness. 'Who are ye?' They say, 'We are of the hostile Sheta.'"

[2] Champollion *Grammaire Egyptienne*, p. 480.

[3] Wilkinson's *Modern Egypt and Thebes*, vol. ii., p. 424.

[4] The sound and signification of this word seem to be proved by its use for "oar" (Lepsius, *Todtenbuch*, ch. xcix., line 16, compared with *Rit.* of Burton, Brit. Mus., Coptic ⲟⲥⲣ, *S.*; ⲃⲟⲥⲉⲣ, *M.*; and in the name of the *Οὐσερχέρης* of Manetho, USER-KEF, head of the Fifth Dynasty.

[5] Wilkinson's *Modern Egypt and Thebes*, vol. ii., p. 429. One Psammuthis alone is known from the Egyptian monuments. He has been usually held to have been the third sovereign of the Twenty-ninth Dynasty (*Ψάμμουθις*), but Chevalier Bunsen makes him the third of the Twenty-third Dynasty (*Ψαμμοῦς*).

[6] For the identification of this town with Leontopolis, see *Horæ Ægyptiacæ*, pp. 176, 177.

[7] Rosellini, *Mon. Stor.*, No. cii., line 18.

[8] This Neheeren may be the Nahiri of the Assyrian inscriptions placed by Sir H. Rawlinson to the west of the Euphrates. It is indeed once written Neharee in a tomb at Thebes (MS. notes of writer).

[9] *Egypt's Place*, vol. i., p. 283.

[10] Corrected from Champollion's *Dictionnaire Egyptien*, s. v.

[11] Coptic ⲁϣ, M. *quis*, &c. ⲉϣ, B. *quis, unde*, &c.

[12] This is valuable as an example of the use of the rare substantive verb TU, with marks of inflection, already noticed by Mr Birch. M. de Rougé had also discovered its employment as a prefix to form the future, had conjectured that it might be a substantive verb like AU, and had pointed out its probable relation to the Coptic.

[13] Rosellini, *Mon. Stor.*, No. cii., line 14.

The affixed personal pronouns are employed for the accusative of the isolated personal pronouns of which they may be regarded as contracted forms; and they are also used as possessive pronouns, and to indicate the persons of verbs. The sense of a sentence in which they occur can alone determine their signification. Thus ANSHEF may be rendered "his life," or "he lives." S-HA-F, "to set it up," or "he sets up," lit. "to cause to set it up," &c. The affixed personal pronoun when used as a possessive immediately follows the substantive to which it applies, whether or not that substantive be followed by an adjective in concord; as, HEST-EF URT "his chief throne."[1]

The proper possessive pronouns are always isolated and placed before, and both in their etymology and their signification may be best rendered by the Greek ὁ—αὐτοῦ, &c.

The determinative relative pronoun is properly indefinite, but it becomes definite by the simple relative pronoun being prefixed to it. In both forms it is isolated.

4. *Nouns.*

Nouns.

The gender of substantives is not to be reduced to any distinct rules; objects in themselves masculine or feminine are assigned to these genders, but the very large class which is not susceptible of this determination is necessarily classed, in the absence of a neuter gender, in an arbitrary manner.

An adjective in concord with a substantive follows it in almost all instances. There are some rare exceptions to this rule, particularly in the case of the words NETER, "divine," and SUTEN, "royal," which always, as far as we are aware, precede the substantives to which they are applied, doubtless from respect to the signification of these words. These afford the only *general* exceptions; of particular exceptions we may instance . . . NETER-HAN,[2] "the *fourth* priest." Ordinal numerals, it should be observed, are declined in the same manner as adjectives.

5. *Verbs.*

Verbs.

It will be necessary to consider in some detail the signification of the different parts of the verb.

The infinitive noun is the root of the verb, and expresses what we should term the abstract notion of its meaning. Although therefore not part of the verb, it must be considered with it. It must be distinguished from the infinitive mood, which both requires a prefixed preposition, and is accompanied in all adjective verbs by the substantive verb either expressed or understood. It may be rendered by "the act of doing," or "the condition of being," as in the following instances:—SHEFT *YU-F* HA . . . RUTEN,[3] "on his *coming* from the land of Ruten;" *YEE* EN HAN-F HA . . . "The *coming* of his holiness from foreign lands."[4] In many cases, when no preposition is used, it is difficult to say whether the word is an infinitive noun or a simple substantive. It may be doubted whether the Egyptians would have expressed "the condition of living" and "life" by different forms of the same root, and not by the same word, and the same difficulty is experienced as to all roots which are simple substantives as well as verbs. With reference to the infinitive mood there can be no doubt, for it may always be distinguished, as in English, by its prefixed prepositions, thus,—NEN-HER NEF *ER MASH* SHER MANEF HANF,[5] "He did not come forward *to fight* after that he had seen his holiness." The root is frequently used for all parts of the verb, and this is especially the case with the forms of the substantive verb. In many inscriptions where the root appears without any marks of mood, tense, number, or person, we may conclude that the license of the scribe has omitted them; but the frequency of this use and its consistency with the genius of the language forbid us from applying this explanation in every case.

The indicative having but three tenses in the Egyptian by which to express the various shades of meaning that have caused the formation of so many tenses in the Coptic, it becomes a matter of importance to determine as nearly as may be their use.

That tense which has been formerly termed the present we have ventured to call the aorist, since it is indefinite, having occasionally a past, though not a past definite signification. The following examples will show its use; firstly, as a simple *present*,—*TATSEN* EN HANF,[6] "*They say* to his holiness;" secondly, as an *imperfect*, *ARY-A* BESHU (AÄSHU?) EN NETERU SHER *UNA* HA TU,[7] "*I did perform* (or was performing) the ceremonies of the gods while *I was* on earth;" and as a *past*, SHA *S-MAK-TU* HESAR ER SHEFTU-F,[8] "as *thou hast justified* Osiris against his enemies." In some cases the aorist has a kind of future signification when it is used for a continuous action or condition commencing at the present time, thus,—SUTEN-SHEB NEB-TU *TEE AREF* HEEB-EF EN (TET[9])? "The king of Upper and Lower Egypt, the lord of the two regions, *performs* the panegyry for ever; "*AWA* SUTEN HA KET ER (TET[10])? "I am king on the throne for ever." In these last instances the use of the future would perhaps be more accurate, although the sense could not be completely expressed without the employment of both future and present. In all the instances which we have given of the use of the aorist, deviating from its primary use as a present, it might perhaps be best rendered in English by the present, for in so doing the idiom of the original would not be lost, nor would any violence be done to our language.

The tense which we have called the past does not deviate widely from a preterite signification. Usually it is a past definite, sometimes it is a pluperfect, and at other times it becomes an emphatic present, though in the last case retaining part of its proper sense. The following examples will explain these uses:—*Past definite*, *ARNEF* MEMENNU-F EN ATF AMEN-RA,[11] "*He has made* (these) his buildings to his father Amen-ra;" *KATNEF* HAN-F ANSH-TA-SNEB-EF . . . BESHEN,[12] "His holiness, of a strong life, *built* a . . . . fort," in the latter of which cases the past sense is more remote than in the former: *pluperfect*, *NEN-HER NEF* ER MASH SHER *MA NEF* HANF,[13] "*He did not come forward* to fight after that *he had seen* his holiness," where the same tense is employed as a past and as a pluperfect: *emphatic present*, *YEE NA* SHER-EK NEB-A,[14] "*I am come* unto thee my lord," which compare with *EEYU A* EMHENEK,[15] "*I am come* before thee," where the simple present is employed. This last use is very similar to our indiscriminate use in English of "I am come," and "I have come."

The future is not altogether unlike in signification to the Hebrew aorist, but the future sense is so predominant that its occasional employment as an emphatic present, indicating determination, does not warrant us in calling it an aorist. Of each use a single example will suffice,—*AW-ER-AR* HEEB,

[12] *Select Papyri*, pl. lxiii., line 1.

[13] Champ. *Gram.*, p. 502.

[14] Lepsius, *Todtenbuch*, cap. cxxv., line 1.

[15] Champ. *Gram.*, p. 487. Champollion (id., p. 477) gives two instances, both from the same part of a temple (that at Dakkeh), in one of which the past is used, and in the other the present, in precisely the same formula *YEENA* SHAR-EK TET, "*I am come* to thee, [O] Thoth;" *YEEA* SHAR-EK HESAR, "*I am come* to thee, [O] Osiris."

"I will celebrate the panegyry."[1] *AWA-RESH TU-RESH-KU-A* REN-EK,[2] "*I will invoke, I will invoke*, thy name," where it should be noted that both forms of future are used in the same sense. The context in this place seems to show that the meaning is, "I do invoke."

What we term the subjunctive mood is not distinguished in the Egyptian from the indicative, as in the following instance,—AW . . . NA HAN EN SUTEN-SHEB NTERASH ANSH (TET ?) *YAÄ* ER KAM[3], "And the holiness of the king of Upper and Lower Egypt, Darius (Hystaspis) ever-living, commanded me that I should go to Egypt."

The imperative and optative moods have each but a single tense. Of the former, it must be remarked, that it is frequently expressed by the root without any mark of time, as,—*PESHT* (TENHU ?)-ET HA-HER-A,[4] "*Spread* thy wings over me;" and that at other times it has the form of the aorist indicative in consequence of the omission of its distinctive prefix MA; as,—*SMENEK* . . . . . HA KA-K,[5] "*Place thou* the royal helmet on thy head." The imperative is sometimes written with its prefix but with no sign of person when it is in the second person singular. Of the optative mood nothing need here be said.

The participles present considerable difficulties both from the various forms they possess and on account of their idiomatic use. As it is probable that some shades of difference were originally indicated by these forms, it will be best to give the examples of their significations under each form separately.

Participle Present.—1. Root preceded by ENT, ENTEE, ENTEN, unconnected; as,—ENTEE-NEHEM, "[He] who delivers, the deliverer."[6] 2. Root with affix TA or T, as,—ENTEK RA *SHATA* SHA,[7] "Thou Pharaoh, ruling like ——." 3. Root with pronominal affixes EF (*m.*) ES (*f.*) sing., and U (*com.*) plur., as,—42 NENETERU *UNNU* HNAK EM US-SHAT ENT (or ENTEE) MATU,[8] "Forty-two gods *who are* (*being*) with thee in the hall of the two Truths."

Participle Past.—This has, as a participial form, the root, with the formative UT or TU indeclinable, either prefixed or affixed, but almost always the latter; as,—NEN-PE-*UT-MA*, SHATETF,[9] "There has not *been seen* ought like unto it," in which the participle is used for the past passive; and HA EM RA-U EN HER . . . . *TATU* HERU KRAS AK, &c.,[10] "The beginning of the chapters of the manifestation . . . . . said [on] the day of the coffin's going," &c.

The formation of the passive is a remarkable characteristic of the Egyptian, more especially as in the Coptic the passive is always, or almost always, expressed by circumlocution. In the hieroglyphic inscriptions we find, however, a regular aorist indicative of the passive voice formed by adding the pronominal affixes of person to the participle past, as in the following passage,—URU NAU EN REMEN TATSEN EM . . NEB TUTEE EM S-NA . . . . F *MATU-K* SHA TEFK RA,[11] "The great chiefs of the land of Remen say in adoring the lord of the two regions of Egypt, in magnifying his . . . . thou *seemest* (*art seen*) like thy father Ra."

6. *Particles.*

Particles.

Besides the regular adverbs, certain words become adverbs by their use in an adverbial sense. These are substantives, adjectives, and prepositions. Thus,—UNNA HNA HER *HERU* AR HEBU EN HESAR UN-NUFR,[12] "I was with Horus *the day* of the celebration of the panegyries of Osiris Unufre," where HERU, "day," is used adverbially. The placing of an adverb immediately after a substantive gives the substantive an adverbial sense, as,—AA-U-NEK PE-HEKA NUFR MER-TEE *AMEN-SHA*, NEB HEBU ATF-EF *PTAH-SHA* ATF NETERU, ATEE *RA-SHA*,[13] "Glory to thee! the king good, twice-loved, *Amen-like*, lord of panegyries, *Ptah-like* [like] the father of the gods, chief *Ra-like*." In the following sentence an adjective takes an adverbial sense,—SHEFT EEY-F HA . . . RUTEN KER HAK *NA* NESHTU,[14] "On his coming from the land of Ruten with captives *a great* many," where the adjective great is employed as in the English idiom. The use of prepositions for adverbs will be seen by the following passage:—PE-TU *ER-HAT*, *ER*-(*PEH ?*), EM KABEB,[15] "The world *before* and *behind* [him is] in [the act of] performing libations."

The use of the prepositions does not present any difficulty, and their formation has been already spoken of in the proper place. The same may be said of the conjunctions, although it should be noticed that they are so rarely expressed in the inscriptions that we may reasonably conclude that they were frequently omitted in the language.

The interjections usually immediately precede the word to which they apply, as,—*A* TET S-MATU HESAR ER SHAT-UF,[16] "*O* Thoth, justify thou Osiris against his adversaries." It must be remarked that sometimes the article occurs between the interjection and the name of the person addressed.

Of the figures of syntax none are more common in the ancient Egyptian than ellipsis and pleonasm. The former is principally used for brevity of expression, and the latter for greater emphasis.

Had the Egyptians poetry?

To this grammatical sketch may be added some observations on the question whether the ancient Egyptians had poetry, and in particular as to the evidence on this matter afforded by their records.

What Herodotus relates of the song of Manerôs indicates very clearly a sacred chant, and from this we might infer the existence of measured prose or poetry in the Egyptian literature. Clemens Alexandrinus, in his account of the sacred books of Egypt, an account which undoubtedly was taken from good authority, speaks of their containing hymns. In describing the procession, he tells us that "first goes a singer, bearing one of the symbols of music: they say that his duty is to be versed in the two books of Hermes, of which one contains the hymns of the gods, the other, the regulation of the king's life;"[17] and later, in speaking of ten others of the Hermetic books, he tells us that they contained hymns.[18] Plato also speaks of hymns as well as music, traditionally supposed to have been composed by

[17] Πρῶτος μὲν γὰρ προέρχεται ὁ ᾽δὸς, ἕν τι τῶν τῆς μουσικῆς ἐπιφερόμενος συμβόλων. τοῦτον φασὶ δύο βίβλους ἀνειληφέναι δεῖν ἐκ τῶν ῾Ερμοῦ· ὧν θάτερον μὲν, ὕμνους περιέχει θεῶν, ἐκλογισμὸν δὲ βασιλικοῦ βίου τὸ δεύτερον. (*Clem. Strom.* vi.)

[18] Δέκα δὲ ἐστι τὰ εἰς τὴν τιμὴν ἀνηκοντα τῶν παρ᾽ αὐτοῖς θεῶν, καὶ τὴν Αἰγυπτίαν εὐσέβειαν περιέχοντα· οἷον περὶ θυμάτων, ἀπαρχῶν, ὕμνων, εὐχῶν, π πῶν, ορῶν, κα τῶν τουτοις ὁμοίων.—*Id., loc. cit.*

Isis.[1] The Egyptian *Ritual*, which we have so often cited, is supposed by the Chevalier Bunsen, with good reason, to have been a portion of those ten books of which Clemens speaks as containing hymns. Yet nothing has been found in it which we can conclude to be measured prose, much less poetry. A careful examination of such of the hieratic papyri as are not copies of the whole, or portions of the *Ritual*, has afforded the same result. *Primâ facie*, indeed, some of these papyri, containing praises of the kings, and some of the late demotic papyri,[2] would seem to be arranged in verses or parallelisms, since we find dots above in the former case, within each line in the latter at equal distances.[3] But a closer examination shows that this must be regarded as merely a method of subdivision, for the convenience of the scribes, perhaps like the English legal reckoning of "folios." In like manner we do not find any indications of poetry in the tablets bearing prayers to the gods, or those which record the exploits of the kings. There is indeed a chant sung while ploughing, inscribed in a tomb at Eilethyas,[4] but this does not seem to be strictly poetry. Although it must be admitted that much of the ancient Egyptian literature has perished, yet enough of it remains for us to form a correct idea of each of its classes, and thus to show that it probably did not contain any poetry, even if we include in that term measured prose. And it is most reasonable to conclude that the Greeks termed those prayers and invocations hymns, which were chanted because they were so recited, and because they corresponded in their subject, though not in their form, to their own hymns.

In order to render this essay complete, some notice is subjoined of the demotic system, expressing the vulgar dialect, in the compilation of which we have received great assistance from Dr Brugsch's *Grammaire Démotique*, to which the reader is referred for fuller details.

SECTION IV.

THE VULGAR DIALECT.

Vulgar dialect.

Although there is reason to believe that the vulgar dialect of the ancient Egyptian was already in existence before the rule of the Eighteenth Dynasty,[5] we cannot prove that it was more ancient than the seventh century B.C., to which period is assigned the earliest known papyrus in the vulgar characters.[6] These characters continued to be employed until the fourth century of the Christian Era. Our knowledge of the vulgar dialect is therefore limited to its condition between these extremes, but its near agreement with the sacred dialect, expressed by the hieroglyphics on the one hand, and with the Coptic on the other, enables us to consider the results of a study of its known records as establishing the main characteristics of this dialect from its first establishment until its abandonment. It does not differ from the sacred dialect in a greater degree than would suffice to constitute a different dialect, and it sufficiently resembles the Coptic to warrant our saying that the latter is but its later form. In comparing the vulgar dialect with the Coptic, we must especially bear in mind that the demotic characters were not adopted to express the more delicate differences of sound expressed by the Greek alphabet, and that on the adoption of the latter by the Copts, the written language became a more accurate representation of the spoken than before. This is most evident in the various forms in which we find one word written in a single dialect of Coptic, some of which, excluding others as the result of carelessness, must have existed in the vulgar dialect, and could only have been represented by a single demotic group.

Demotic system.

Sounds.

The alphabet of the vulgar dialect contained at least one more distinct sound than did that of the sacred. L and R are distinguished by separate phonetic signs in the demotic writing, although in the hieroglyphics the former sound either did not exist at all, or was represented by the same signs that were used for R. It is commonly held that SH and CH or KH were likewise distinct, but this Dr Brugsch doubts,[7] and it is probable that the corresponding Coptic sounds had common representatives in the demotic characters no less than in the hieroglyphic. We have endeavoured to show, in opposition to the prevalent opinion, that such was the case in the latter system. The demotic alphabet also has a letter which appears, from its correspondence to the Coptic ϫ and ϭ, to have been a hard S, like the Arabic ص (ssâd), or a hard GH[8], like the غ (gheyn) of the same language.[9] Some believe that this letter, whatever its precise sound or sounds may have been, had its representative in the hieroglyphic alphabet, but this cannot, we think, be satisfactorily proved. The certain difference, therefore, between the alphabets of the sacred and vulgar dialects is the distinction, in the latter, of L from R, the probable difference the separation of a hard S or GH from K, and the possible difference the distinction of SH and CH. We have evidence, here, therefore, even if we reject every one of these differences excepting the first, of the commencement of that separation of sounds in the written character, which, checked by the conservative bias of the Egyptians, did not acquire its full development until the formation of the Coptic alphabet.[10]

Characters.

It is more important in the present place to indicate the relation of the demotic signs to the hieroglyphic, than to describe them in detail, which indeed would involve a repetition of much that has been said respecting the latter in the earlier part of this treatise.

The demotic character must be considered, if we found our opinion on its records of all periods, to be a debased form of the hieratic, differing from it principally in expressing the vulgar dialect, but also in its signs being ruder in shape, probably fewer, and in a preference being given to phonetic characters over representations and symbols. It is remarkable that the earliest known demotic writing scarcely differs from the hieratic except in expressing a different dialect. Hence we may reasonably suppose that this oldest demotic known to us is not much later than the time of the institution of the character, since it does not seem likely that a character which subsequently underwent considerable and rapid changes should have remained stationary in its primitive form for any long period. The hieroglyphics were unquestionably greatly changed in the course of centuries, but this was chiefly through the increase of their alphabetical class by the admission into it of signs originally syllabic or ideographic, for the changes in form are the result of a decline of art, not of an intentional alteration.

[6] Brugsch, *Gram. Dém.*, pl. i.
[7] *Gram. Dém.*, p. 17.

[8] The term "hard" is here used to prevent confusion with the soft GH, of which the pronunciation of Γ in Romaic affords an example.

[9] It is important to recollect that for centuries Arabic has been the language commonly spoken by the Copts, and that their own language has long ceased to be spoken, although, as Sir Gardner Wilkinson informs us, it has begun to be again spoken. Even when it was spoken for several hundred years past, it could only have been as a dead language, very much as Latin was employed in the middle ages. Hence the pronunciation of the Copts may be reasonably supposed to have been affected by their use of Arabic, and we cannot in any case accept the pronunciation now taught by them except as hypothetical.

[10] It is not meant to be concluded from what is here said that all the Coptic letters properly represented various sounds of one alphabet, since some of them are used exclusively, or nearly so, for Greek words, while others are purely dialectal.

So distinctly is the demotic writing traceable to the hieratic, that Dr Brugsch remarks that each demotic sign should have its hieratic prototype,[1] although he has been unable in some cases to ascertain these prototypes. Being a written character, the demotic was not so variously arranged as the hieroglyphic, but, as is usually the case with the hieratic, written from right to left, in horizontal lines. One sign was very rarely placed above another in these lines, this usage being nearly confined to particular characters, almost all of which were phonetic. Ligatures of two characters were more frequent than in the hieratic, and on this account the *separate* characters in any particular inscription are usually fewer. It is also observable that some single signs in the demotic represent more than one hieratic sign, and thus more than one sound, whether the signs represented be ideographic or phonetic, two signs altogether distinct being thus expressed by one. This is the result of the similarity of hieratic signs which, through the carelessness of the scribes, became identical in the demotic. The position of these signs made their use intelligible to the Egyptians. In these matters it does not appear that the demotic system was characterized by the exercise of inflexible rules: on the contrary, it displays an irregularity natural in a popular mode of writing.

It will not be necessary to speak in any detail of the demotic signs in their different classes, for they follow the same principles as the hieroglyphic. The distinctive peculiarities of the demotic system have rather to be indicated. It should be remembered that the hieroglyphic and hieratic systems are but two different forms of writing the same characters for the same dialect; and that the only reason why the demotic is more frequently compared to the latter than to the former is because of its being derived from it as to its forms.

In demotic as in hieroglyphic the signs were either phonetic or ideographic, and the phonetic signs were further divided into alphabetic and syllabic, the ideographic into iconographic and symbolic. Signs of the ideographic class were used as determinatives to phonetic groups. Thus the system of the hieroglyphics was retained in a mode of writing to which it was manifestly not fully applicable; since the forms of the ideographs were rude, and often retained scarcely a semblance of their original hieroglyphic shapes; and this circumstance is curiously illustrative of the conservative feeling of the ancient Egyptians, who preferred applying their difficult system to the vulgar dialect than adopting or inventing something more practical. Necessarily, however, ideographs, whether in their primary use or in the secondary place of determinatives, were much less frequent in the demotic writings than in the hieroglyphic, and usually less than in the hieratic. In the demotic alphabet we do not find any evidence of simplification, for had it been a simple alphabetic system, we should perceive either one sign or an equal number of signs for each letter. It is not, therefore, to the characters that we must look for the distinctive features of demotic. They are to be discovered rather in the words which those characters express. It must not be supposed, however, that the peculiarities of which we speak are of that markedness which we are accustomed to regard, often incorrectly, as essential to the ancient and the modern forms of a language. We must not expect the difference that we see between Latin and Italian, or even Greek and Romaic; for the causes that have made Italian a different language from Latin, and Romaic a new phasis of Greek, did not exist in the history of the Egyptian language until after the formation of the demotic system. Even if we compare the sacred dialect of the ancient Egyptian with the Coptic, carefully setting aside those changes which may be pronounced accidental, we find a most remarkable agreement, and trace the rudiments of almost every peculiarity of the Coptic in the parent dialect. In the demotic such an inquiry with reference to both the earlier and the later form of the language—for the vulgar dialect, whether itself changed or not in its oldest known records from a more ancient form, must be regarded as the offspring of the sacred dialect—will lead us to the same result, and will tend to show that the peculiarities of Coptic are of native growth, owing their development rather than their origin to foreign influence, unless, indeed, foreign influence in remote ages originated those distinctions of the vulgar dialect, which it afterwards appears to have promoted.

Words.

The roots in demotic are still monosyllabic, but the vocabulary appears to contain a greater number of words of more than one syllable than does that of the sacred dialect. The marks of gender and number are the same as in the hieroglyphics. The inflected parts of speech do not possess a dual; and the sign of duality, which has been erroneously supposed to indicate the dual number, is less frequently used than in the sacred dialect. The definite article and the pronouns generally follow the use of the hieroglyphics, although showing marks of the changes which are more evident in the Coptic.

We have noticed the virtual absence of composition in the sacred dialect. This peculiarity we find to be not so marked in the vulgar dialect as expressed by the demotic characters. The formation and use of compound substantives is, for example, much more frequent, as of those formed with T'I-EN, corresponding to the Coptic ϫιⲛ (M.B.), ϭιⲛ (S.), forming verbs from nouns expressing the action of the verb; and REM-AF, corresponding to the Coptic ⲣⲉϥ (M.), &c., and forming nouns denoting the agent. Except in these particulars, the nouns in demotic do not present any remarkable differences from those of the sacred dialect. The modes of expressing the plural, and the uses of prepositions in relation to substantives, are the same as in that dialect.

Of the adjectives in particular it need only be remarked that they are susceptible of composition, a class being formed by prefixing to the verbs the enclitic pronouns of the third person singular, AF for the masculine, and AS for the feminine; thus from ANSH, to live, we have AF-ANSH, living, the Coptic ⲉϥⲱⲛϧ; and from AEB, to be pure, AS-AËB, purified, pure (*f.*), Coptic ⲉⲥⲟⲩⲁⲃ.

The verbs very clearly indicate the transition from the sacred dialect to Coptic, for we find the tenses more numerous than in the former, and observe a deviation from its principles. The substantive verb in at least four forms is employed without marks of person, and one of these forms, if not more, is also susceptible of conjugation in the aorist. With respect to the adjective verbs, their derivative and compound forms are especially characteristic. Among the former we must notice the reduplicate form, which is rarer than in the sacred dialect, and the causative, with the prefix SA, corresponding to the S of the hieroglyphics, which is still more rarely employed than the former. The forms which are composed of two verbs, the first of which has almost become a formative particle, are classed by Dr Brugsch among the derivatives, though they are properly chiefly compounds. Those verbs which this learned writer admits to be compound are formed by a verb prefixed to a substantive, adjective, or preposition. The aorist of the indicative is the same as in hieroglyphics; but it possesses an emphatic form with the substantive verb and enclitic pronoun prefixed to the root—thus A-I, perhaps pronounced AW-I.[1] The past tense is formed by prefixing NE and affixing the pronominal terminations, thus showing a change from the hieroglyphics. There are two (if not three) forms of future —that with TA-I prefixed, corresponding to the hieroglyphic TU; and AI-EN, corresponding to AU-ER. The two forms, it will be noticed, present differences of which the most striking is the change of the preposition. The subjunctive mood is distinguished by the prefix ENTA, immediately followed by the pronominal marks of person. The optative and infinitive follow the uses of the sacred dialect, and there are similar negative conjugations, although the particle indicating negation in some forms stands between the marks of tense and the root, in others at the head of the whole form. The non-inflected parts of speech present little comparative variation from their hieroglyphic originals, and need not receive any especial notice in the present place.

---

[1] "Chaque signe démotique doit avoir son prototype hiératique quoique quelques-uns me soient restés inconnus jusqu'à présent." (*Grammaire Démotique*, p. 15.)

From this short view of the peculiarities of the vulgar dialect we may learn somewhat of its relation to the sacred dialect and to the Coptic, and see that in this branch of the inquiry the discoveries of the Egyptologists have led to as satisfactory and consistent results as in the rest. Had the interpretation of the Egyptian characters been of that vague and unsatisfactory nature that some would have us to believe, is it credible that it should have led after a length of time to the tracing of the differences of the two dialects? Those who have accompanied us thus far in our inquiry will not, however, we trust, be troubled by any doubts as to the truth of that great and memorable discovery which we shall ever gratefully attribute to our countryman Dr Young.

Concluding remarks.

Before concluding this article, we may enumerate the works most useful to any one commencing the study of ancient Egyptian. The student should first gain some knowledge of Coptic, particularly of words; its grammar he will find useful, but the vocabulary will be of greater service. He will do well to read carefully Peyron's *Grammar*, and he will find Parthey's *Vocabulary* more convenient than the Lexicons for constant reference. He must take care not to be too much biassed by what he learns of Coptic in his next step, the study of ancient Egyptian. He must reverse the order in which Clemens Alexandrinus tells us the Egyptian modes of writing were in his time learnt, for he must take the hieroglyphic mode first, then the hieratic, and last of all the demotic. For the hieroglyphics he will still have to begin with Champollion's *Grammar* and *Dictionary*. The diffuseness of these works is, however, so great that he will do well to follow the example of the writer and abridge both, copying all the words and significations from the latter work, and taking the chief characteristics of the language from the former without attempting at this stage to improve Champollion's arrangement. This method will fix a great number of words in the student's memory, and give him a good idea of the system of writing. He can next acquire some knowledge of the hieratic characters, which may be easily done by transcribing hieratic texts into hieroglyphics, with the aid of the table at the close of Champollion's *Grammar*. Having thus gained an elementary acquaintance with the sacred dialect, he can attempt to read some inscriptions. The easiest of these, and the most interesting, are the historical ones of the Eighteenth and Nineteenth Dynasties, which he will find in Rosellini's great work, which is better arranged than the similar one of Champollion, and more portable than that of Lepsius, which, however, contains many more records, particularly of other periods of Egyptian history. And here we may express a regret that no one has thought it worth while to publish a collection of the most important Egyptian inscriptions in a portable form, and at a moderate price. Having thus become somewhat familiar with the language, the student may read the Chevalier Bunsen's account of it in his *Egypt's Place*, and that contained in the present article, and he will thus gain more distinct general views than he had previously possessed, and be able to examine the Ritual, the historical hieratic papyri, and the various published inscriptions. He will do well to collect Dr Hincks', Mr Birch's, and M. de Rougé's papers, as far as he can, and to compare the various views of the different scholars who have followed Young's and Champollion's method. At the same time he should endeavour to make himself acquainted with the people whose language he is studying, in doing which he will receive the greatest aid from Sir Gardner Wilkinson's *Ancient Egyptians*. If he can visit Egypt and Nubia he will find his studies greatly assisted by the local knowledge he will thus acquire. The reason of much that before appeared obscure will then be seen by him, and his pursuit will acquire a stronger interest. The demotic forms a separate study, more difficult and less interesting than that of the sacred characters. It is, however, not without a high value as supplying a link between the sacred dialect and the Coptic, and therefore it should not be overlooked. Brugsch's *Grammar* will be found an excellent guide to a knowledge of the demotic.[2]

(R. S. P.)

---

[1] This form corresponds in appearance to the future in the sacred dialect when the preposition is omitted, but we have shown that this omission is one of writing, and that the preposition was really pronounced. The fact that the demotic tense is not the same as the hieroglyphic thus corroborates our opinion founded on other evidence.

[2] To the works mentioned above, and many others, we have, as the foot-notes sufficiently tell, been much indebted. We have also to express our personal obligations to Mr Lane, Sir Gardner Wilkinson, the Rev. Dunbar Heath, and others, for the assistance they have rendered us. (R. S. P.)

HIEROMANCY, the art of divination from the appearance of victims offered in sacrifice.

HIERON, or HIERO I., tyrant of Syracuse, succeeded his brother Gelon, B.C. 478. Hieron had already distinguished himself at Himera. A jealousy soon arose between him and his brother Polyzelus, who had the command of the army. A war was on the point of breaking out between Hieron and Theron of Agrigentum, who had espoused the cause of Polyzelus, when a reconciliation took place between the brothers. Hiero now proceeded to extend his dominions. He seized Naxos and Catana, transferring the inhabitants to Leontini. He put Syracusans in Catana, and changed its name to Ætna. Upon the death of Theron war broke out between Hieron and Thrasydæus, son of Theron, but victory declared in favour of Hieron. His tyrannical measures led him to fear attempts against his life, and hence we are told that he kept up a large body of mercenaries, as well as numerous spies. He deserves credit, however, in two important respects. By his vigorous assistance to the Cumæans, the power of the Etruscan pirates was completely destroyed, B.C. 474. Of the spoils consecrated after this victory, a helmet of bronze was discovered about forty years ago. Besides defeating the pirates, Hiero was the patron of poets and philosophers. He has been immortalized in the *Odes* of Pindar as a successful competitor at the Grecian games. Amongst the eminent men patronized by Hiero, are found the names of Pindar, Æschylus, Xenophanes, Simonides, and Epicharmus. Hieron died at Catana, B.C. 467.

HIERON II., king of Syracuse, born at the close of the fourth century B.C., was descended from Gelon. He distinguished himself as a soldier, and in a popular tumult was chosen general by the Syracusan army. He not only got this appointment confirmed by the people themselves, but having married the daughter of Leptines, the most influential man in Syracuse, the way was open to still higher power. Not feeling secure with the fickle mercenaries who had elected him, he took occasion to expose them to be cut to pieces by the Mamertines; then levying an army of Syracusans, he proceeded to chastise the Mamertines. City after city was taken from them, and after the signal defeat which they sustained at the River Longanus, peace was granted them through the friendly interference of the Carthaginians. Returning to Syracuse, the people saluted Hieron as king. Though Hieron had assisted the Romans with provisions in their siege of Rhegium, yet as the Romans opposed his attempt to drive the Mamertines out of Sicily, hostilities were begun between them. Hiero joined the Carthaginians, but getting little or no assistance, the Roman consuls effected a landing, and after some fighting a treaty was concluded. For upwards of forty years Hiero now remained the steady friend of the Romans. He gave them valuable aid during the first Punic War at the sieges of Agrigentum and Lilybæum. As a reward, the tribute which he formerly paid was remitted, and he was included in the treaty of peace at the close of the first Punic War, B.C. 241. After this he visited Rome, where he displayed great liberality, and received signal honours. At the breaking out of the second Punic War he remained equally steady in his friendship with the Romans, whom he assisted with ships and provisions. He is supposed to have died B.C. 216, upwards of ninety years of age.

His government was mild and eminently popular. He laid aside the pomp of royalty, and appeared undistinguishable from a private citizen. The corn laws which he established were so admirable, that in subsequent times when the Romans took possession of Sicily these laws were retained. His liberality extended to other nations besides the Romans. He sent assistance to the Rhodians, whose city had been destroyed by an earthquake, and in the largest ship then ever built he sent presents to Ptolemy king of Egypt.

HIERONYMUS, king of Syracuse, grandson of Hieron II., succeeded to his grandfather at the age of fifteen, B.C. 216. Up to this time a close friendship had subsisted between the Romans and Syracusans. (See HIERON II.) But the battle of Cannæ, in which the Romans were so terribly defeated, disposed many of the Syracusans to join the Carthaginians. Hieron II. had appointed fifteen guardians, including Andranodorus and Zoippus, to guide the young prince, but through the intrigues of Andranodorus, who was favourable to the Carthaginians, the guardians were all induced to resign their office. The young prince was now entirely under the influence of Andranodorus and Zoippus, who were sons-in-law to Hieron II. Communications were at once opened up with Hannibal. The Carthaginian envoys were received with great favour, whereas the Roman envoys were treated with contumely. Hieronymus was preparing to take the field against the Romans with 15,000 men, when he was assassinated in Leontini by conspirators under Deinomenes. His short reign of one year and one month was disgraced by indulgence in luxury, debauchery, and cruelty. He is said to have desecrated the name of queen by raising a prostitute to that dignity.

HIERRO, ISLE OF, one of the Canaries belonging to Spain. See CANARIES.

HIGDEN, RALPH, or RANULPH, author of the *Polychronicon*, was a monk of the monastery of St Werburg in Chester. He spent sixty-four years of his life in the convent where he finally died at a very advanced age. The date of his death is assigned to various years between 1360 and 1373. The *Polychronicon*, bringing down the history of England to 1357, is written in Latin. Of the original only that part has been published which brings down the narrative to 1066; but an English translation of the whole work by John de Trevisa was printed by Caxton at Westminster in 1482, and has been several times reprinted. Trevisa's manuscript is now in the Harleian collection, and seems not to have been very carefully followed by its original publisher.

HIGHAM FERRARS, a borough and market-town of England, Northamptonshire, 15 miles E.N.E. of Northampton, on the Peterborough branch of the London and and North-Western Railway. The parish church is a large and handsome building, richly ornamented with carvings and monuments. The old cross in the market-place, and the ruins of the ancient college, are interesting to the antiquary. There is a neat town-hall and a grammar school in the town, which before the Reform Act used to return one member to parliament. Shoes are the chief industrial product of the inhabitants. Pop. (1851) 1140.

HIGHGATE, a village of Middlesex, 4 miles N. by W. of London, on the great north road. It stands on a hill about 450 feet high, and commands a striking view of London and its suburbs. The church, built in 1833, is a handsome Gothic edifice, with an elegant spire. On the slope of the hill, immediately below the church, is the North London Cemetery. Highgate has a free grammar and other schools, a literary and scientific institute, dispensary, and an asylum for idiots. Pop. (1851) 4502.

HIGHNESS, a title of honour given to princes. The title of "highness" was given to Henry VII.; and, along with "your grace," continued to be used by Henry VIII. till about the close of his reign, when "your majesty" was adopted in preference to both. Along with other titles, that of "highness" was given to the Prince of Orange by Louis XIV. of France in 1644.

HIGHWAYS, or ROADS, are of various kinds; public highways, parish roads, carriage roads, horse roads, footpaths, and loanings of way for cattle. Public highways are vested in the crown for behoof of the public. In like manner the streets of burghs are held for the public by the magistrates. In no case can they be encroached on without the authority of parliament. The highways in Scotland are now under the regulations of the general statutes 4th Geo. IV. c. 49, and 1st and 2d Will. IV. c. 43, together with local statutes for different counties. The highways in England are under the regulations of the statute 5th and 6th Will. IV. c. 50. The local statutes are interpreted as if they formed part of the general ones, and are only effectual in so far as they are consistent with them. There are also the statutes 3d and 4th Will. IV. c. 33, relative to Highland roads; the 1st and 2d Vict. c. 118, relative to the conveyance of the mails by railroads, and powers of the postmaster-general; and 2d and 3d Vict. c. 45, regulating the crossing of highways by railways. The parish roads are still maintained on their old footing by statute labour. The trustees of highways are not entitled to shut up parish roads, or interrupt servitude roads, in order to compel parties to travel on the highways, whereby they may be made liable in tolls. The other roads or ways mentioned above are properly servitudes or burdens on estates for the benefit of conterminous heritors, their families, friends, and tenants, and bear some resemblance to the Roman servitudes,—*iter*, a right of horse or foot passage, *actus*, a carriage way, and *via*, which was broader than the others, and comprehended the rights of both. The usages of Scotland are analogous to these; excepting that a horse road is not included in a foot road. These servitude rights are sometimes constituted by writing, and sometimes by immemorial possession and acquiescence. In whatever way constituted, they cannot be enlarged without the consent of the owner of the land over which they pass; and he is not bound to be at any expense in maintaining the way. A right merely of footpath does not prevent the owner of the land from inclosing it, provided he leave a stile for the passengers at each end of the enclosure; and he may even shift the line a little if no real inconvenience be occasioned. In England, as in Scotland, a right of way may be acquired by prescription, as when the inhabitants of a hamlet, or owners or occupiers of a farm have immemorially crossed ground for particular purposes, such as going to church, or market, or the like; for such immemorial usage supposes that there was originally a grant. The great distinction between a servitude of way and a public road is, that the former belongs only to the parties by whom it has been acquired, while the latter is open to any body who chooses to use it, and who may even *brevi manu* remove any unwarranted obstructions that have been recently erected.

HIGHWORTH, a market-town of England, Wiltshire, on a hill 26 miles N. by E. of Devizes. Its church, which belongs chiefly to the fourteenth century, contains some curious old monuments. Market-day, Wednesday. Pop. of parish (1851), 4026.

HILARIA, a great Roman festival, celebrated in honour of Cybele at the vernal equinox. It was begun on the 22d of March and brought to a close on the 25th. The last day of the feast was the most important, and the inhabitants of the city then abandoned themselves to the most extravagant merry-making. All kinds of amusements were in vogue, especially masquerading, which, from the earliest times, has been popular in Italy. The only religious ceremony was the solemn procession of the priests, who bore round the streets the statue of the great mother of the gods with many solemnities. The only object of the festival was to celebrate the departure of winter with its snows and gloom, and to hail the approach of spring.

HILARY, Bishop of Arles, was born in Gaul at the beginning of the fifth century. Belonging to a family of distinction, he received a good education and gave early proof of ability and perseverance. Through the influence of Honoratus, abbot of Lerins, he became a monk; and after some strong opposition on his part, he consented to become bishop of Arles, at the early age of 29. The part which he took in the deposition of Chelidonius involved him in a quarrel with Leo the Great. Both Hilary and Chelidonius betook themselves to Rome, but Hilary, though willing to consult Leo, was not willing to submit to his authority. This at once provoked the hostility of the Pontiff. The deposition of Chelidonius was cancelled, and Hilary was obliged to make his escape, as best he could, back to Gaul. After being deprived of his authority by Leo, the well-known edict of Valentinian III. decreed, "Ut Episcopis Gallicanis omnibusque pro lege esset quidquid apostolicæ sedis auctoritas sanxisset, &c." This encroachment upon Gallican ecclesiastical liberty is important in the controversy between Romanists and Protestants, as showing, first, that about the middle of the 5th century supreme power was claimed by the Roman Pontiff; and, secondly, that this claim was resisted by the metropolitan of Gaul. Hilary died A.D. 449, 49 years of age. He wrote numerous epistles, of which that addressed to Eucherius is extant. We have also his life of Honoratus his preceptor.

HILARY, the *Deacon*, was born in Sardinia in the middle of the 4th century. He and Lucifer of Cagliari appeared at the Council of Milan before Constantius, to defend the followers of Athanasius. His remarks offended the emperor so much that he was ordered to be scourged and sent into banishment. He held that all heretics, including Arians, should be re-baptized before admission to the Catholic Church. Some writings ascribed to him are probably not his.

HILARY, *St*, Bishop of Poictiers, was born in the same town at the beginning of the 4th century. His parents were pagans of distinction, who afforded him every means of acquiring a good education. He was particularly struck with the writings of Moses, and afterwards with the gospels. He became a Christian, and was baptized along with his wife and daughter. He was greatly respected in his native city, and, although married, he was chosen bishop. This took place at the middle of the 4th century. At this period Arianism was spreading rapidly through the Western Church, and he set himself to oppose it. With this view he obtained the excommunication of Saturninus, bishop of Arles. But by the Council of Beziers, A.D. 356, he was banished to Phrygia. In 359 he made his appearance at the convocation of bishops at Sileucia in Isauria, and energetically resisted the opponents of the consubstantiality of the Word. Thereafter, at Constantinople, he was so persevering against the prevailing Arianism of the court, that he was sent back to his bishopric at Poictiers. Though he was received in triumph, he had enough to do for some time in eradicating the Arianism which had sprung up during his absence. After expelling Saturninus a second time, he accused Auxentius, bishop of Milan, of holding erroneous views. Both were summoned before the emperor Valentinian. Auxentius gave satisfactory answers. Hilary declared him a hypocrite, and was ordered to leave Milan as a disturber of the peace of the church. He died in January 368. His great energy of character, his courage and unwearied perseverance rendered him very influential during his life. His zeal, however, was often injudicious. He was called the hammer of the Arians (*Malleus Arianorum*), from his determined opposition to the Arian heresy. Of his works, his *Commentary on Matthew* is the oldest extant on that evangelist. His most elaborate work consists of twelve books on the Trinitarian controversy. He wrote several books addressed to the Emperor Constantius in favour of the Catholics against the persecutions of the Arians; he wrote also several epistles still extant, and some poems have been ascribed to him. The best edition of his works is that of Constant, reprinted by Scipio Maffei, 1730. 2 vols. folio.

HILARY TERM, a legal term in England, beginning January 11, and ending January 31. The festival of St Hilary, from which this term takes its name, is January 13.

HILDBURGHAUSEN, a town of Central Germany, duchy of Saxe-Meiningen-Hildburghausen, on the Werra, 17 miles S.E. of Meiningen. It was formerly the capital of Saxe-Hildburghausen till the union of that duchy with Saxe-Meiningen, and is now the seat of a consistory and of an upper district court. It has a gymnasium, normal, trade, and Jewish schools, and a lunatic and an orphan asylum. The castle is a fine building. Manufactures chiefly cloth and papier-maché. Pop. 4300.

HILDESHEIM, a province of Hanover, comprising the principality of Hildesheim, which forms the most southern part of Hanover Proper, the principalities of Göttingen and Grubenhagen, the county of Hohnstein and the Lower Eichsfeld. Area 1717 square miles. The principality of Hildesheim originated in a bishopric instituted in 812 by Charlemagne, at Else, but removed in 822 to Hildesheim. In course of time, the bishops acquired a considerable territory, amounting, in the beginning of the present century, to 682 square miles. The last prince bishop of Hildesheim possessed also the bishopric of Paderborn, acquired by his predecessor. Both bishoprics were secularized and ceded to Prussia in 1803. In 1807 they were incorporated with the kingdom of Westphalia, but were restored in 1813 to Prussia, which ceded Hildesheim to Hanover, retaining only Paderborn. The principality of Hildesheim is generally level except towards the S., where it is traversed by branches of the Hartz. Its principal stream is the Innerste, an affluent of the Leine. A considerable portion of the surface is wooded, and the rest yields moderate crops of rye, barley, flax, and potatoes, with some wheat. The chief manufacture is linen. The principality of Göttingen is mostly covered with mountains, offsets of the Hartz, chiefly of basaltic formation. The principal river is the Weser. The soil in the mountain districts is generally stony, but that of the valleys is of great fertility. Sheep are reared in great numbers. Grubenhagen is, like Göttingen, for the most part mountainous, but the peaks are higher, and include some of the loftiest summits of the Hartz. The climate is bleak and variable. Some of the valleys are fertile and well cultivated, but these are exceptions to the general sterile character of the soil. Woods and forests, which cover above half its surface, constitute the chief wealth of the district. The mines are valuable, and yield silver, copper, lead, iron, zinc, vitriol, and sulphur. The remaining portions of the province are too small to require particular notice. Pop. of province (1852), 186,628, of whom 296,734 were Lutherans, 60,302 Roman Catholics, 7627 Reformed, and 3023 Jews.

HILDESHEIM, the capital of the above province, stands on the right bank of the Innerste, 18 miles S.E. of Hanover, with which it is connected by railway. It is a large old town, irregularly built, and surrounded by ramparts now used as public promenades. The cathedral (founded by Louis the Pious, in 818) is remarkable for its fine bronze gates of the 11th century, and paintings on glass; among its antiquities is a marble pillar supposed to have been a Saxon idol, but now surmounted by a cross. Several of the other churches are remarkable for their antiquity and monuments. The educational institutions comprise a Roman Catholic and a Lutheran college and numerous schools. It has also a lunatic, a deaf-mute, and several orphan asylums, and a large workhouse. The chief manufacture is coarse linen cloth. Pop. 14,700, of whom about one-third are Roman Catholics.

HILL, AARON, an English miscellaneous writer of the eighteenth century, was born at London in 1685. His education at Westminster School was broken off in consequence of his father's imprudence, who allowed the family property to go to ruin, and thus, at the early age of fourteen, he began that career of adventure which only ended with his life. Leaving England, he proceeded to Constantinople, where he was kindly received by Lord Paget, a relation of his mother's, who was then British ambassador at the Turkish court. Under the care of a tutor provided by this considerate friend, young Hill travelled through Palestine, Egypt, and a great part of the East; returning to England about the year 1703. A misunderstanding with his patron compelled him to go abroad as travelling companion to a rich Yorkshire baronet; and on reaching home in 1709 he published his *History of the Ottoman Empire*, which, even by his own admission, had far more success than it deserved. About the same time appeared his poem of *Camillus*, in honour of the famous Charles Mordaunt, Earl of Peterborough; and in the same year he was made master of Drury Lane Theatre, and afterwards of the Haymarket. Both of these offices he soon after lost through his indiscretion, and spent the remainder of his life partly in literary pursuits, and partly in commercial speculations, which were all unlucky. One of these schemes called him to the Highlands of Scotland, and while there he wrote *The Progress of Wit, being a Caveat for the use of an eminent Writer*. The "eminent writer" was Pope, who had introduced Hill into the *Dunciad*, though in a way that was in fact complimentary, and the "caveat" is said to have made him feel very uneasy. Hill died in 1749, at the very moment, it is said, of the great earthquake of that year, and was buried in Westminster Abbey. Two only of his seventeen dramas are now remembered, *Zara* and *Merope*, both adaptations from the French of Voltaire. His poetry is stilted and commonplace, and even the *Progress of Wit* never rises above a flippant smartness. Though a poor and tasteless poet, and afflicted with an overwhelming sense of his own importance, Hill was an honourable man, and his letters to Savage show his character in a very amiable light. His letters with the author of *Pamela*, extending from 1730 to 1748, are not quite so creditable to his taste. Some of them were prefixed by Richardson to an edition of his *Pamela*, and described as coming from "a gentleman of the most distinguished taste and abilities." Till it was known that the "gentleman" in question was Aaron Hill, great weight was attached to the testimony of the anonymous correspondent.

HILL, *George*, Principal and Doctor of Divinity of St Andrews, was born at St Andrews in 1750. He gave early indication of good abilities, and of a leaning towards the clerical profession. He gained the first prize in the competition proposed by the Earl of Kinnoul, chancellor of the university, and this was the beginning of a friendship which lasted for life. Through Principal Robertson, Mr Hill was appointed tutor to the eldest son of Pryse Campbell, Esq., M.P., with whom he went to London in 1767. This enabled him to send pecuniary assistance to his mother, whom he tenderly loved, and who had a family of six to rear upon very small means. In London he was not a little indebted to his attendance on a society called the Robin-Hood Society for his proficiency in oratory. In 1771 he removed with his pupil to Edinburgh, and in the following year was appointed joint-professor of Greek in St Andrews. In 1775 he was licensed by the Presbytery of Haddington to preach the gospel, and ordained by the same body in 1778. His eloquence and impressiveness procured his appointment to the second charge in St Andrews in 1779. In the following year, by which time he was well known as one of the most popular and efficient ministers in the church, he got the degree of doctor in divinity. In 1808 he was translated to the first charge in St Andrews. He soon afterwards became successor to Principal Robertson as leader of the *Moderate Party* in the controversy with regard to patronage.

Principal Hill deserves honourable mention as the reviver of the study of theology in St Andrews. He had been admitted to a divinity chair in 1788, and, with his energy and ability, theology was treated in a manner very different from what had hitherto prevailed. His *Lectures* were a good antidote to the superficial "refutations" of Calvinism upon which English divines sometimes ventured. In 1791 he was appointed Principal of St Mary's College. In 1816 his health began rapidly to decline, and in 1819 he died in the 70th year of his age.

Hill, *Sir John*, an English botanist and social notability of the eighteenth century, was born in London about 1716. He began life as an apothecary in Westminster, was afterwards keeper of the botanical gardens of various noblemen, next took to the stage, from which he was hissed, and ended by adopting the career of letters. Some little scientific treatises which he published met with great success, and this success completely turned his head. He set up a carriage, affected the airs of a fine gentleman, and tried to force his way into fashionable society. To effect the latter purpose he established a paper, *The Inspector*, in which he chronicled all the gossip and scandal current among "the quality," and which he used as a vehicle for puffing the quack medicines in which he dealt largely. His audacious impudence and insatiable vanity urged him to court notoriety in any form, and neither was he in the least abashed by the personal castigations which he not unfrequently received in public from the victims of his scandalous periodicals. Had he not preferred to be notorious he might have been famous, for he really did possess a very considerable aptitude for science; and to botanical science, in particular, he made some valuable contributions, such as his *Vegetable System*, in 26 vols., 1759-75. The price of this work was 38 guineas plain, and 160 with the plates coloured. His *British Herbal; General Natural History*; and *History of the Materia Medica*, were all far from contemptible works. One of the great objects of his ambition was to be admitted into the Royal Society, but his applications were always rejected with scorn. Enraged at his repeated failures, he published a *Review of the Works of the Royal Society*, in which he exhausted against some of his early friends and benefactors all the resources of his wit and scientific knowledge. His self-love was a little consoled by his receiving from the university of St Andrews, in Scotland, the honorary degree of M.D., and from the king of Sweden, to whom he used to send his works, the title of Chevalier of the Order of Wasa, on the strength of which he called himself Sir John. He died in 1775. (An extremely good account of Sir John's quarrel with the Royal Society, and many interesting details of his life, are given in Disraeli's *Miscellanies of Literature*.)

Hill, *Rev. Rowland*, A.M., the most popular preacher of the Whitefield school that has appeared in England since Whitefield's death, was a cadet of the patrician family of the Hills of Hawkstone, in Salop, and was born in 1745. Like other members of his family, Rowland Hill gave early evidence of piety; and at Eton and Cambridge, where he was educated, he evinced it under circumstances which put its genuineness beyond a doubt. While a student at the university, where he graduated with great distinction, he spent all his leisure time in visiting the sick and poor, and in praying from house to house—conduct so utterly at variance with the received notions of college decorum, that he was only saved from expulsion by the powerful influence of his family. After taking orders, he was appointed in 1773 to the parish of Kingston, Somersetshire, where he began to indulge his favourite taste for open-air preaching, and soon attracted great crowds of the rural population to the sermons which he preached nearly every day of the week. In 1782, having resolved to make the metropolis his headquarters, he had the Surrey Chapel built for him, and soon filled it with an audience such as no other preacher in London could boast. During the summer months he retired to his country-house in Wales, whence he made what he called "gospel tours" into all parts of the country. In 1798, and again in 1824, he visited Edinburgh, where, on the Calton Hill, he preached to audiences of ten, fifteen, and even twenty thousand persons. After these tours he always returned with renewed enthusiasm to his duties at Surrey Chapel, where he continued to officiate almost to the day of his death, 11th April 1833.

Without a tithe of the intellect or literary skill of his great contemporaries, Hall and Chalmers, Rowland Hill had yet a gift of popular oratory nowise inferior to theirs. His power over a mixed audience was scarcely surpassed by that of Whitefield, whom he seems to have had always before his eyes as his model. There was no faculty which he possessed that he did not freely avail himself of in driving home into the hearts of his hearers the great truths of the gospel. Not unfrequently he violated the laws of good taste by eccentricities of manner, but, whether he convulsed his hearers with the broadest humour or the most pungent wit, or melted them to tears with the deepest pathos, he never lost his moral influence over them by condescending to buffoonery on the one hand or melo-dramatic affectation on the other. His earnestness and intensity carried him safely through where a mere actor would infallibly have broken down. The current stories of his pulpit eccentricities require to be received with great caution. His works, which were for the most part on controverted subjects of temporary interest, are already forgotten, but the memory of the man will long be cherished by his country as one of the most truly apostolic and disinterested ministers whose names adorn the annals of the national church. (An ambitious but ill-written life of Rowland Hill, by the Rev. Edwin Sidney, A.M., a protégé of his, was published in London in 1834.)

Hill, *Rowland*, better known under his title of Lord Hill, was one of the most distinguished officers in the British army during the great wars of revolutionary France. He was a cadet of the ancient family of the Hills of Hawkstone, in Shropshire, and was the nephew of his namesake the famous preacher. Born in 1772, and entering the army very young, Hill received, or at least completed, his education at the military school of Strasbourg. He took part in the siege of Toulon, and afterwards in the Egyptian campaign, and, partly by purchase, partly by merit, rose to the rank of major-general. In 1808 he went to Spain with the Duke of Wellington, and from Vimeiro to Vittoria, in advance or retreat he proved himself the most indefatigable coadjutor of the great captain. In 1809 he was appointed to succeed Lord Paget; two years later he defeated the French under Girard at Cavarez with great slaughter; for his conduct at Talavera he was publicly thanked by parliament; and for his capture of the forts of Almarez, which cut off the communication between the French armies on the N. and S. sides of the Tagus, he was rewarded with the title of Baron of Almarez. In 1813 he held temporarily the chief command of the English and Hanoverian troops in Belgium; and two years later crowned the glories of his noble career by his conduct at Waterloo. In 1828 he was made commander-in-chief, and exercised all the influence of his fame and position to improve the condition and promote the interests of the British army, in which he effected many valuable reforms. In the distribution of the extensive patronage which he had to dispose of he was proverbially impartial, and always made a point of advancing professional merit, regardless of the claims of party or family connection. On resigning the command-in-chief in 1842 he was made a viscount, which honour, however, he did not long live to enjoy, as he died on the 10th December of that same year.

Lord Hill was the most popular soldier of his time in the British service, and was so much beloved by the troops, especially those under his immediate command, that he gained from them the honourable title of "the soldier's friend." "With Hill," they used to say, "both victory and life may be ours." On the other hand, the strategic skill and military capacity he displayed in the Peninsula secured for him the not less honourable title of "the right arm of the Duke of Wellington." From the first day he entered the army he displayed the germs of those qualities that afterwards led him on to fame, rank, and power—boldness that amounted to daring, and was yet always under the control of the judgment, skill equal to independent commands of the most difficult kind, and a regard for the moral and physical welfare of the army such as had never before been shown by any commander-in-chief.

HILLAH. See Babylon.

HILLEL, Rabbi, born at Babylon, 112 B.C. He went to Jerusalem to study law at the age of 40. When 80 years of age he became chief of the Sanhedrim. He was one of the compilers of the Talmud, and is regarded by the Jews as the most learned of their doctors. He gave instruction in the laws and traditions to more than a thousand pupils. His master was Shammai, with whom he did not agree on some points. The difference became a quarrel, warmly taken up by the disciples of each, and ending in some bloodshed.

HIMALAYA, a Sanscrit word, compounded of "hima," *cold* or *snow*, and "alaya," *place of* (Wilson's *Sanscrit Dictionary*), is the name given to the ranges of mountains which bound India on the N., from the bend of the Indus on the W. to that of the Brahmaputra on the E. On the S. they are bounded by the plains of India, and on the N. by the Tibetan courses of the above-named rivers. A transverse section of the Himalaya nowhere presents the appearance of a simple range, but of several more or less parallel chains, separated by valleys of very great depth and steepness; this is because the secondary ranges that ramify N. and S. from it are of great length, breadth, and complexity, and from bending to the E. or to the W., often run for many miles parallel to one another and to the main range, besides rising into eminences loftier than any on the latter, for which they are sometimes mistaken. The axis of the Himalaya is, moreover, not marked out by any continuous ridge or succession of peaks, but is often broad, open, and low, compared with the neighbouring isolated eminences. Hence the line of watershed becomes the only geographically determinable axis; and this, as in all mountain chains of any extent, follows an extremely sinuous course. No doubt this line, which throws the waters in two opposite directions throughout the whole extent of the range (1440 miles), is also that of greatest elevation, or that along which the land is uninterruptedly the most lofty.

Before, however, the real nature and geographical limits of the Himalaya, as above defined, can be rightly understood, it is necessary to consider this range in its relation to the little known mountain systems of Central Asia, of which it perhaps forms a less important part than is usually supposed. On reference to the map of Asia, the watershed of that continent will be found to follow a tortuous line, running diagonally from the peninsula of Gujerat to Behring's Strait. Across the plains of India this line is for the most part indicated by the Arawali chain, N. of which it crosses the Himalaya obliquely in a N.E. direction to the sources of the Indus and Brahmaputra, whence it trends westerly to the source of the Oxus, and then again north-easterly along the Altai to the S. of Lake Baikal, till it becomes the Iablonoi Mountains, and finally terminates in the prolongation of that range which traverses the country of the Tchuktchi.

All the great rivers of Asia rise in this watershed; those from its western slope flow N. into the Polar Sea, W. into the Caspian or Aral, and S.W. into the Arabian Sea; those from its eastern slope flow E. and S.E. into the Pacific, and S. into the Indian Ocean. Enormous mountain chains branch off to the E. and W. of this main axis, inclosing the valleys of the rivers; and of these chains the southernmost is the Himalaya.

Limits of the chain.

In their Tibetan courses the Indus and Brahmaputra occupy valleys of great elevation, and the opposite directions taken by them indicates the division of the Himalaya into two portions, the eastern of which stretches from their sources at the Peak of Kailas to the bend of the Brahmaputra, and the western terminates at the bend of the Indus. These limits are more natural than is usually supposed, since the prevalent idea that the Brahmaputra enters Assam through a defile caused by a break in the chain is erroneous; on the contrary, the Himalaya gradually declines in elevation in East Bhotan; and the upper valley of the Dihong (as the Brahmaputra at its bend is called), is, according to the best information hitherto procured, broad, open, and hot—rice being cultivated there on the very confines of Eastern Tibet. So also the Indus at the western extremity of the chain is usually described as flowing through a defile; but though its valley to the W. of Kashmir is contracted and rugged, and overhung by stupendous mountains, it does not in this respect differ materially, if at all, from the remainder of its Tibetan course; nor is the fall of its bed between Iskardo and the plains of the Punjab greater in proportion to the length of its course than it is above that town.

The branches or secondary ranges of the Western Himalaya are so long and lofty, that some difference of opinion exists as to which of them should be most appropriately considered as the continuation of the chain between the peak of Kailas and Kashmir; and we have considered the line of watershed between the tributaries of the Indus to the N., and the rivers that flow to the plains of India to the S., to be the axis of the chain, since it both indicates the line of mean greatest elevation, and is the only definable axis in a geographical point of view.

Of the secondary chains we shall speak at length in connection with the rivers they inclose. Their direction is often perpendicular to the main chain, but they are so often oblique, and even parallel to the main chain, especially at their upper parts, that where very lofty and heavily snowed, they are frequently taken by local observers for the axis of the Himalaya itself; an error to which may be traced that misconception regarding the relative amount and duration of the snow on the northern and southern slopes of the Himalaya, which has led to so much fruitless controversy in India and Europe.

The general direction of the Himalaya throughout its length of 1440 miles, is E. and W., but it trends northwards from the centre towards its western extremity, its extremes being respectively in N. Lat. 28., E. Long. 95., and N. Lat. 35., E. Long. 73. Its breadth varies in different parts, but has been accurately ascertained in the western portion only, where it deviates but little from 190 miles.

It has been stated[1] that the mountain ranges of the Himalaya and the Kouenlun[2] have no special existence as chains apart from the general elevated mass of Tibet, and that that rugged country forms the summit of a great protuberance above the level of the earth's surface, of which the two chains form the N. and S. faces. This view is derived, no doubt, from the appearance of extreme confusion that prevails in this, as in every mountainous country. In the Himalaya, as in Switzerland, the traveller, in crossing ranges and valleys at all angles, perceives no order, and finds it impossible to trace rivers or chains from elevated positions; whilst in following the courses of the valleys, their bounding mountains shut out all beyond; and it is only after a map has been constructed that the relations between the several parts of a mountainous country can be traced with accuracy. The mountain system of Central Asia differs in a physico-geographical point of view from that of Europe only in bulk. The relation of the Kouenlun to the Himalaya is similar to that of the Bernese to the Monte Rosa Alps. These have not, it is true, a separate existence apart from the general mass of the Alps, but that they have a special existence also is proved by the positions of the sources of the rivers that flow to the northward and southward from each. Taking as an example the western half of the Himalaya and the parallel range of the Kouenlun, the facts that the average elevation of the watersheds of both is continuously above 18,000 feet the whole way from the Kailas to the meridian of Kashmir, whilst innumerable peaks on each rise above 20,000 feet, and that the inclosed river-bed of the Indus falls from 15,000 to 7000 feet in the same distance, appear sufficient evidence that the ranges in question have a definable existence in a geographical point of view. The elevation of the Kouenlun and Himalaya above the bed of the Indus is continuously higher in proportion than that of the Bernese and Monte Rosa Alps above the bed of the intervening Rhone.

---

[1] Captain R. Strachey, *Journ. Geog. Soc.*, May 1851; *Quart. Journ. Geol. Soc.* 1852 (249).

[2] By this general name we shall (following Humboldt) designate the two chains parallel to the Eastern and Western Himalaya respectively, and north of them, and which together stretch from the sources of the Oxus to Eastern Assam. Its western branch, from the Peak of Kailas to Balti (in W. Tibet), has been called the Kailas and Karakoram range: of its eastern branch nothing is known.

General features of the Himalaya.

Before detailing the physical features of the Himalaya, it appears advisable to give some general idea of its scenery and aspect; this is derived from the impressions produced on experienced travellers who have described it. Of these there have lately been many, and although few of them have had that previous familiarity with mountain regions which would enable them to judge of the Himalaya by comparison, the narratives of Moorcroft, Thomson, the Stracheys, Cunninghams, and others, all abound in accurate and often graphic details.

Viewed from a distance, on the plains of India, the Himalaya presents the appearance—common to all mountainous countries—of consecutive parallel ridges, running E. and W.; backed by a beautiful crest of snowy peaks, with occasional breaks in the foremost ranges, through which the rivers debouche. This appearance of parallel ranges is owing to a very simple and often overlooked law of perspective; in consequence of which masses of mountains, of whatever configuration, resolve themselves into ranges perpendicular to the line of sight.[1] Any view of the Himalaya, especially at a sufficient distance for the remote snowy peaks to be seen overtopping the outer ridges, is, throughout a great extent of the range, rare, from the constant deposition of vapours over the forest-clad ranges during the greater part of the year, and the haziness of the dry atmosphere of the plains in the winter months. At the end of the rains, when the S.E. monsoon has ceased to blow with constancy, views are sometimes obtained from a distance of nearly 200 miles. From the plains the highest peaks subtend so small an angle that they appear like white specks very low on the horizon, tipping the black lower and outer wooded ranges, which always rise out of a belt of haze; and from the density, probably, of the lower strata of atmosphere, they are never seen to rest on the visible horizon. The remarkable lowness on the horizon of the whole stupendous mass is always a disappointing feature to the new comer, who expects to see dazzling peaks towering in the air. Approaching nearer, the snowy mountains sink behind the wooded ones long before the latter have assumed gigantic proportions; and when they do so, they too often appear a sombre, lurid, grey-green mass of vegetation, or rock, with no brightness or variation of colour.

The mountains once entered, the appearance of parallel ridges is found to be deceptive, and due to the inosculating spurs of long tortuous secondary ranges that run N. and S. from the axis, dividing deep wooded valleys, which flank the beds of large rivers. The snowy peaks now look like a long E. and W. range of mountains, at an average distance of 30 or 40 miles. Advancing farther into the country, this appearance proves equally deceptive, and from the same cause. The snowy range is finally resolved into isolated peaks, or masses, situated on the secondary ranges; and the source of the deception is found to be that these snow-clad spurs, projecting E. and W., cross one another, and, being uniformly white, appear to connect the peaks into one grand unbroken range. The rivers, instead of having their origin in the snowy mountains, rise far beyond them: many of their sources are upwards of 100 miles in a straight line from the base of the mountains, in a very curious country, loftier by far in mean elevation than the secondary ridges which run S. from it, yet comparatively bare of snow. This rearward part of the mountain region lies in Tibet, and it is here that most of the rivers rise as small streams, which increase rapidly in size as they receive the drainage from the snowed part of the secondary ranges that bound them in their courses.

Terai.

A belt of tropical forest, 10 to 20 miles in breadth, skirts the southern foot of the Himalaya throughout the greater part of its length. Its presence is due to the humidity of the climate, and to copious springs, which often give rise to marshes which cover the ground at the base of the mountains. This tract is called the Terai, and is notorious for its malarious atmosphere, which renders it almost certain death to spend any time in it during the spring and autumn (before and after the rains). The Terai belt is broadest, most luxuriant and humid in the Assam valley at the eastern extremity of the chain, narrowing with the diminished humidity and colder winters of the western part. It decreases in breadth, and partially loses its tropical character towards the central districts; whilst to the westward of the Sutlej it disappears, or is represented by a low jungle of bushes, containing but few tropical plants.

Outer hills.

Beyond the Terai the mountains rise more or less suddenly, though seldom in precipices. Throughout the eastern parts of the chain they are luxuriantly wooded, while to the westward they are covered with a looser, drier forest, or with brushwood. The mountain region may be entered by following the course of one of the main rivers, or by ascending the outlying spurs which bound them, and which run more or less parallel to the general direction of the chain. The roads almost invariably ascend these spurs, because the malarious region extends far up the valleys, and the banks of the rivers are usually impracticable for paths. The Himalaya once entered, the traveller's route is thenceforth an uninterrupted series of ascents and descents. There are no level tracts, plains, nor flats by the streams, of any breadth or continuity; an endless succession of ridges, several thousand feet high, and as many streams, are crossed on almost every day's march towards the axis of the chain; and during the warmer part of the year the amount of forest, fog, and cloud is so great, that until the alpine regions are reached, the traveller seldom enjoys any of those magnificent panoramic views for which the Cordillera and the European Alps are so celebrated.

Throughout the temperate and wooded regions it is scarcely possible for the traveller, let his powers of observation be ever so good, to understand the relations of the innumerable rivers and ridges he traverses. The country resembles a troubled ocean; and there being no apparent order, it is only by taking the main river that flows from the watershed as the starting-point, and laying down its course on paper with some accuracy, that a correct idea can be obtained of the structure of the valley which the traveller is ascending, and its relation to the secondary Himalayan chains that bound it.

---

[1] Thomson's *Tibet*, p. 2.

The roads from India to Tibet are always carried along the flanks of these broad valleys, for the ridges of the secondary chains are too lofty, rugged, and tortuous to admit of roads being constructed along their crests, while the river banks are hot, and excessively tortuous and rocky. It is the necessity for crossing the spurs from these secondary chains, with their innumerable subdivisions and contained streams, which doubles the length of the route from the plains of India to the axis of the chain; the average distance, which is only about 100 miles, usually occupying from twelve days to a fortnight to traverse; and the total ascent, which is on the average 16,000 to 18,000 feet, being performed many times over, besides involving descents which are so steep as to be hardly less fatiguing than the ascents.

Outer valleys, dhuns, &c.

Immediately within the mountains the outermost lateral valleys (containing the feeders to the main rivers) are often broad, and bounded (especially those in the western parts of the chain) on one or both flanks by low sandstone hills. The breadth and extent of these, together with the peculiarity of the rock, has given them an undue importance in some respects. Such broad open valleys are called dhuns, and the sandstone hills (sometimes called the Sewaliks) have been supposed to constitute a system distinct from the Himalaya, but skirting its base. This theory has, however, been rejected by Dr Thomson,[1] who shows that the dhuns are valleys of precisely the same nature as the other lateral valleys; and that the sandstone ranges, however different in a geological point of view, are, in a geographical one, the terminal spurs of the ranges bounding the river valleys. Where the dhuns are very open, flat-floored, and with gradually sloping beds, their true relation to the surrounding mountain-chains is not at once apparent. Sometimes they appear to be indefinitely extended E. and W., in a direction parallel to the Himalayan chain; and, running from one great river to another, they appear to belong to a different order of valleys from those which occur further within the mountains. This arises in some cases from the slope of their beds being so extremely gradual that the watershed between the valley that ascends from the one river, and the corresponding valley that descends to the other river, can only be detected by observation of the drainage; whence the two valleys appear to form one. Such is the case with the celebrated Dehra Dhun in Kumaon, which appears to form one continuous transverse valley between the Jumna and the Ganges, but which really consists of two valleys; one descending from the village of Dehra (which occupies the *col*) westerly to the Jumna, and the other descending from the same spot easterly to the Ganges. Other dhuns, again, are simply very broad, open valleys, differing in no physical features from those that occur in other parts of the mountains. In the Punjab-Himalaya, where the tertiary sandstones acquire a great development, two or three such valleys occur in succession before the higher mountains begin. These dhuns are not, as is very generally supposed, continuous along the whole extent of the Himalaya, and interposed between the tertiary and secondary mountains. They are merely the outer series of lateral valleys, and are always of limited extent.

Temperate and alpine regions.

It is in the alpine and upper temperate regions of the Himalaya that the most interesting phenomena of the range are concentrated, where the climate resembles that of Great Britain and the alpine districts of Europe; and the scenery, if not so picturesque, exceeds in grandeur that of Switzerland and the Tyrol. Throughout the Indian watershed of the chain, the main features, between 8000 and 14,000 feet, are more or less conspicuously European; whether or not they equal those of the Alps may be doubted. In absolute height and mass the Alps of course cannot be compared with the Himalaya; and such a view as the following extract describes (whose main features are characteristic of all parts of the range) is doubtless unrivalled on the globe. The author was at the time in Sikkim, not far from the centre of the chain, and his description embraces the snowed mountains, including the loftiest in the world, as seen from the N. flanks of the outer ranges. "The actual extent of the snowy range seen from Darjiling is comprised within an arc of 80° (from north 30° W. to north 50° E.), or nearly a quarter of the horizon, along which the perpetual snow forms an unbroken girdle or crest of frosted silver; and in winter, when the mountains are snowed down to 8000 feet, this white ridge stretches uninterruptedly for more than 160°. No known view is to be compared with this in extent, when the proximity and height of the mountains are considered; for within the 80° above-mentioned more than twelve peaks rise above 20,000 feet, and there are none below 15,000 feet, while Kinchin is 28,178, and seven others above 22,000. Kinchin-junga (45 miles distant) is the prominent object, rising 21,000 feet above the level of the observer (28,178 above the sea) out of a wilderness of intervening wooded ranges; whilst, on a line with its snows, the eye descends below the horizon to a narrow gulf 7000 feet deep in the mountains, where the great Rungeet, white with foam, threads a tropical forest with a silver line." From another point of view in the same country, and also at 7000 feet elevation, the eye surveys at one glance the vegetation of the tropics and the poles. "Deep in the valleys the river beds are but 3000 feet above the sea, and are choked with fig-trees, plantains, and palms; to these succeed laurels and magnolias; and higher up still, oaks, chestnuts, birches, &c. Pine forests succeed for 2000 feet higher, when they give place to a skirting of rhododendron and berberry. Among these appear black naked rocks, rising up in cliffs, between which are gulleys, down which the snow in January descends to 12,000 feet, ascending in one unbroken sweep to peaks of 18,000 to 25,000 feet. (*Himalayan Journals*, vol. i., p. 123 and 327).

The Alps nowhere present panoramas so remarkable as these; but when once amongst the snowy mountains, the traveller's position, in respect of proximity to the snowy masses, as well as in elevation, is analogous in both ranges; the absolute heights of the principal objects being nearly the same, and strictly comparable. The apparent elevation of a mountain range is merely relative; and throughout the enormous arc of horizon embraced in a Himalayan view, its apparent vertical height is much diminished by the great distance of the nearest objects. To view Kinchin-junga as Mont Blanc is viewed from Chamonix, the traveller must ascend to 12,000 feet, for it is at that elevation that the vegetation and physical features of the valleys, caused by the moraines, &c., are analogous to those of 3000 feet in the Alps; and from such positions Kinchin-junga being but 3000 or 4000 feet higher above the observer than Mont Blanc (a difference not appreciable by the eye amid such scenes), and being further from the spectator, is not a more strikingly grand mountain than Mont Blanc. In the long extent of the Himalaya there are alpine scenes of unrivalled grandeur; but owing to the rarefaction of the atmosphere, and other causes, these regions will always remain inaccessible to any but the most hardy seekers of the picturesque, for they can only be viewed under circumstances of extreme physical discomfort. In certain respects, again, the Himalayan valleys are greatly inferior to the Alpine, for they want both lakes and cascades; and though Himalayan travellers may find scenes more awful, and solitudes immeasurably more impressive than any the Alps present, there are none known which, in grandeur, beauty, and picturesqueness combined, are to be compared with Lauterbrunnen or the valley of Chamonix. Nowhere in the Himalaya do blue glaciers, descending from mountains towering 10,000 feet above, pour their icy streams on to the flat floors of green valleys covered with corn, flocks, and villages; whilst lakes reflecting both the forest-clad base and snow-clad summits of one and the same mountain are, we believe, wholly unknown in Northern India.

---

Tibetan regions and axis of the range.

Immediately beyond the most heavily snowed ranges of the chain the still ascending traveller enters on the loftiest, coldest, and windiest desert to be found in the temperate zone of either hemisphere, a country contrasting quite as much with the alpine country he has just left, as with the tropical regions at the base of the mountains. This is the axis of the Himalaya, where all its rivers have their rise, and which owes its freedom from snow in part to its distance from the sources of humidity and the mass of intervening ranges, but in part also to its great elevation; for it is in the lower part of the atmospheric column that most vapour is suspended; and as the humid wind only blows from the S., the bulk of its moisture is deposited in the form of rain on the southernmost parts of the mountain range, and of snow on the secondary ranges, 15,000 to 20,000 feet high, which extend many miles S. from the axis. Hence the clouds get absolutely dispersed before they can reach the latter point, and the traveller who has crossed that part of the range where enormous snow-beds and glaciers descend to 15,000 or 16,000 feet, and thence ascends to 18,000 or 19,000, finds no snow at that level; whilst the surrounding mountains also are so bare of snow that it is difficult to conceive that he has not descended an opposite slope.

The features of the main axis of the Himalaya differ greatly at different points of the chain; it is usually broad, and is always characterized by extreme vicissitudes of temperature. As with the Cordillera, the Norwegian Alps, and many other mountain ranges, the line of the watershed is not marked by any continuous ridge or succession of ridges; loftier eminences oftener rise in its proximity, from the spurs that branch off from it than from itself; and as the southernmost of these are (as has been already shown) always very heavily snowed, it has been usual to consider the belt of the most snowed peaks (which, as seen from the southward, shuts out the view of the loftier rearward axis), as the crest of the Himalaya. Dr Thomson has, however, pointed out that the deceptive effects of false perspective, the rarity of snow, the absence of a defined ridge on the axis, and the occasionally greater elevation of isolated peaks on the subsidiary ranges, have led to the transference of the true axis from the watershed to an imaginary line cutting across the valleys of all the rivers. As even the most recent maps of India represent the Himalayan rivers as cutting through the axis of the chain, it is necessary to bear in mind upon what slender authority this is done, and that throughout two-thirds of the extent of the Himalaya, there is no foundation whatever for the position either of the rivers or of the axis, as laid down on our maps. From Kumaōn the whole way to the eastern termination of the chain, with the exception of the small province of Sikkim, nothing whatever is even approximately known of the relation of the rivers to the snowy mountains, or of these to the axis. Many lofty peaks are seen from the plains of India, and the positions of a few of these have been determined by triangulation; and in the earlier maps these were fictitiously represented as forming eminences on a continuously snowy ridge. The information was afterwards supplied by the natives that the sources of the rivers were far beyond these snows; and to reconcile these phenomena the streams were invariably made to intersect the ridge.

The fact, that in that portion of the Western Himalaya which lies between Nepal and the Sutlej, the loftiest eminences are situated on the subsidiary ranges, was first stated by Col. Herbert; but his observation, that the line of the great peaks intersects the river basins, and therefore is not the true axis of the Himalaya, has never yet been fully appreciated. More recent geographers have, however, so multiplied the number of these peaks in that portion of the Himalaya to which Col. Herbert's observation extended, that no single line of great peaks can now be traced in reality; and with regard to the explored portions of the Himalaya W. of it, and to the Sikkim portion E. of it, it is certain that the great peaks do not follow any definite line; added to which, the number of peaks on the axis itself, attaining elevations of 20,000 to 25,000 feet, is very great.

Reverting to the physical features of the loftiest regions, the suddenness with which the dry Tibetan climate and its concomitant features are often encountered, by crossing a lofty pass over a lateral heavily-snowed spur of a secondary range, is very remarkable, and contrasts with the slowness of the same change when a river is followed to its source; and as the short cuts over these spurs are generally preferred to the winding courses of the rivers, a false impression has been conveyed of the definition of the boundary between the dry and humid regions. This erroneous impression is strengthened by another fact, that the political boundary between the Tibetan and Indian states is often determined by the position of the greatest quantity of snow—a physical obstacle to intercourse of far more importance than the greater elevation of the comparatively snowless watershed N. of it. Recent discoveries have, however, shown that this boundary is neither so straight nor so natural as has been supposed, or as is represented in maps. In the small state of Sikkim, for instance, it zigzags so much that it is 50 miles further S. in one meridian than in another. Again, in the western part of Nepal, it is said to follow the true axis, or watershed; whilst in the more snowy eastern half of the same kingdom, it is traced along the most snowed regions; and it has in many places been repeatedly altered in the course of the last century by the Tibetans and Chinese.

A few other points in the physical geography of the axis of the Himalaya and of its loftier valleys are worthy of note. Such are the prevalence of lakes, never of any great depth, and of tertiary deposits, often extending for many miles, and forming undulating expanses, through which the rivers cut deep gorges, and which also form flats and terraces along the banks of the streams. These have given rise to the supposition that Tibet is a vast plain or plateau—an error which the fact that the roads in that usually difficult country make long detours to take advantage of these flats, has tended to confirm. That Tibet is however the most rugged and mountainous country in the world, the united testimony of all travellers assures us; and that no such level expanses, or lakes (with the solitary exception of Kashmir), or flat-bottomed valleys, occur in the equally mountainous, though perhaps less rugged and precipitous temperate and tropical valleys of the Indian watershed, is a very remarkable fact.

Divisions of the Himalaya.

In classifying the geographical features of the Himalaya, as they occur, in belts parallel to the axis, we recognize four distinct latitudinal zones. 1. That which extends from the plains of India to those parts of the chain where the elevation is sufficient for snow to lie upon the ground during the winter months; within this the bases of the hills and all the valleys are tropical, and the upper portions temperate. The surface, though steep, and cut up into innumerable ravines, is seldom absolutely precipitous, or continuously rugged. This belt is from 40 to 60 miles broad, and presents eminences of all heights below 13,000 to 14,000 feet —the mean being perhaps from 5000 to 8000 feet. 2. In the snowy belt, which is from 30 to 40 miles broad, the climate is temperate in the valleys, and tropical where these are very deep and damp; alpine on the heights. The mean elevation is probably under 13,000 feet, though innumerable peaks rise to 20,000, a few to 25,000, and some to 28,000 feet; while the river beds are often only 3000 feet above the level of the sea. The surface of this belt is very rugged and often precipitous. 3. The axis of the chain is from 10 to 20 miles broad, probably 15,000 feet in mean elevation; and the line of watershed itself seldom sinks below 17,000 feet, except at the two extremities of the chain. The surface is very rocky and often precipitous, but varied with occasional undulating expanses; the climate is alpine throughout. 4. The northern slope consists of rugged rocky valleys, with occasionally flat floors: a temperate climate, but one of excessive vicissitudes, prevails below 13,000 feet elevation; and great drought and a total absence of forest vegetation distinguish it from the analogous elevations of the southern side.

These general remarks indicate three principal series of divisions of the Himalaya, viz., according to length, breadth, and height; these are:—

1. *Longitudinally;* an eastern and western Himalaya.
2. *Latitudinally;* an exterior or damp, an interior or snowy, and a Tibetan or dry Himalaya.
3. *Altitudinally;* a tropical, temperate, and alpine Himalaya.

Rivers.

The secondary ranges, which originate in the axis, and descend on the S. slope to the plains of India, and on the N. to the Tibetan Indus and Brahmaputra, separate great rivers, and may consequently be conveniently used to divide the whole chain into a succession of river basins.[1]

The great rivers flowing to the S. are thirteen in number; advancing from W. to E., they are,—the Jelam, Chenab, Ravee, Byas, Sutlej, Jumna, Ganges, Gogra, Gandak, Kósi, Tista, Monas, and Subansiri.[2] The directions of these rivers vary a good deal, being often extremely oblique, especially in the upper part of their courses, to the axis of the chain. As a general rule, those that rise nearest to the centre of the chain (as, for instance, the Tista) have the straightest courses; those that are situated to the eastward flow first S.E., and then turning S., follow a western course, to the Assam Brahmaputra; those in the W. of the chain, flow first S.W., and then turning S., flow easterly. Of these rivers, the two eastern, the Monas and Subansiri, flow through Bhotan; the Tista drains Sikkim; and the three next, the Kósi, Gandak and Gogra, which are Nepalese, all flow into the Ganges; the two following, the Jumna and Ganges, water the British hill states of Kumaōn, Garhwal, and Sirmore, W. of Nepal; the remaining five water the Punjab, and flow into the Indus, draining amongst others the hill states of Mandi, Chamba, Jamu, and Kashmir, respectively.

The fall of the rivers varies with the length of their course; that of the Tista is perhaps the most rapid, the river descending from 17,000 feet to 300 (at its exit on the plains), with a fall of 85 feet per mile; this, however, varies in different parts of its course; thus, between 17,000 and, 15,000 feet, it is 60 feet per mile; between 15,000 and 12,000 feet, 140 feet per mile; between 12,000 and 5000 feet, 160 feet per mile; and between 5000 and 300 feet, 50 feet per mile. Analogous differences have been observed in other Himalayan rivers, as in the Tambur, a tributary of the Nepalese Kósi, and in some of the western rivers;[3] as the Sutlej, which, for the first 60 miles of its course, falls 35 feet per mile; in the following 50 miles, 82 feet per mile; and in the succeeding 68 miles, 25 feet per mile. The Indus again, for the first 90 miles, falls about 3 feet per mile; in the next 115 miles, 28 feet per mile, and in the remaining 345 miles, falls 18 feet per mile. The prevalence of this gradual fall at the upper part of the rivers has been attributed mainly to the fact, that in the dry climate of the axis, the floors of the valleys are raised and levelled by glacial and other accumulations, which have been removed by denudation from the lower parts of the same valleys.

All the Himalayan rivers increase enormously in volume during the summer months; in the eastern portions, where the rains are very heavy, the increase is more due to this cause than to the melting of the snow. The individual feeders of the main streams also differ much; those that rise from glaciers being in summer opaline and full, in winter clear and less in volume. Again, the main body of the streams is in summer swollen and muddy, owing to the excessive rains, but in winter clear and diminished to a fraction of its summer volume. In summer the glacier-fed feeders are always much the coldest; in winter all approximate more in temperature. In summer the volume of all the snow-fed feeders of the rivers is much diminished at night, owing to the less rapid melting of the snow, and the frequent freezing of their head waters; but this is scarcely appreciable in the central and eastern parts of the chain, where most rain falls at night, and where the effect of the sun's rays in melting the snow is less than that of the rain and corroding fog.

The rivers flowing northward from the axis have much shorter courses; and, owing to the dryness of the climate, they carry comparatively little water. The principal of those that flow into the Indus are the rivers of Dras and Zanskar: of those that flow into the Tibetan Brahmaputra none are known to geographers except the Painom, which flows from the N. of the province of Bhotan, and falls into the Brahmaputra near the holy city of Teshoo Loombo.

The rarity of cascades, on a scale at all commensurate with the grandeur of the mountains and the volume of the rivers, is a peculiarity worthy of observation. Tibet, where absolute precipices are more numerous, is better adapted for waterfalls, but the dryness of its climate sufficiently accounts for their paucity.

Lakes.

The Himalayan lakes are almost confined to Tibet, where many of the rivers have their apparent sources in lakes fed by innumerable very small glacier streams. Some of these lakes are very extensive, as that of Yeumtso in Eastern Tibet, whose drainage is unknown; the Ramchoo lakes, which are said to give rise to the Painom; and the Mansarowar or Tso Mapham, and Rakas Tal or Tso Langak lakes; which are sheets of water 20 to 30 miles long, and of considerable breadth, elevated 15,200 feet above the sea; they give rise to the Sutlej. In the Western Himalaya the principal lake is the Tso Moriri, also of 15,200 feet elevation, 30 miles long, and placed on the axis of the chain; it has now no exit, but was once of greater dimensions, when its superfluous waters (which, no doubt, were then fresh) formed a tributary of the Sutlej. The waters of the Tso Moriri, and of many other Tibetan lakes, are very salt; a fact attributed to the evaporation and drainage exceeding the influx in the case of those which have outlets, and by the further concentration of the salts in the instances of lakes without drainage, which are hence always the saltest. The *rationale* of the formation of the Tibetan lakes has never been investigated; many of the smaller ones are no doubt due to dams thrown across the valleys they occupy by the moraines of glaciers; others may be due to the unequal elevations of the surface; and the majority no doubt owe their existence to the deposits thrown across river beds by lateral feeders of the rivers themselves.

---

[1] The geographical importance of these divisions was first indicated by Mr Hodgson in a valuable paper printed in the *Journal of the Asiatic Society of Bengal.*

[2] The Indian source of the Brahmaputra is amongst the Mishmi Mountains of Upper Assam. These mountains form part of a system quite unconnected with the Himalaya, and which divide the waters of the Brahmaputra from those of the Irrawaddi and other rivers of Birma, China, &c.

[3] H. Strachey, *Phys. Geog.* of W. Tibet, p. 45.

The Himalayan lakes, not situated on or near the axis, are extremely few and unimportant; the Walur Lake in Kashmir (elevation 5000 feet) is the only large one; and the small tarns of Bheem-tal and Nynee-tal, a few miles long, and 4000 to 6000 feet above the sea, are both in Kumaōn. It is a singular fact, that throughout the whole extent of the Himalaya, the Walur Lake (formed by the Jelam) is the only instance of any of the great rivers or their feeders forming any considerable expanse of still water.

Plains, &c.

Peat bogs, and moors analogous to those of Northern Europe, are wholly unknown in the Himalaya; their absence in the southern valleys is partly owing to the configuration of the latter, and more perhaps to the great rainfall. Of absolute plains there are perhaps none in the Himalaya; the comparatively level upper valley of the Sutlej being the only approach to an exception, and certainly a remarkable feature. Its extreme length is 120 miles, and its breadth varies from 15 to 60; its elevation is from 14,000 to 16,000 feet. It appears to be formed by a tertiary deposit of gravel and boulders; its surface is undulating, and broken by mountains in the eastern part. Such a feature as this, suddenly expanding before the traveller, weary of the endless ascents and descents of the southern slope of the Himalaya, must be very striking; and we accordingly often find it designated as an absolute plain. There is, however, a fall of 1000 feet from its southern edge to its centre; many mountain spurs intrude upon it; the Sutlej cuts a gorge 3000 feet deep through its longer axis; and the lateral ravines of the feeders of that river are so numerous, deep, and steep, that Moorcroft, one of the most accurate of observers, who first traversed it, calls these slopes mountains, and does not allude to the existence of a plain. Like many other mountainous valleys, it appears much flatter than it really is, from being generally viewed from a great elevation.

Elevation of the Himalaya.

It is now undisputed that for its length the Himalaya exhibits the loftiest eminences in the world by very far, but it is yet to be determined whether it is the greatest mountain mass. The great range of Kailas or Karakoram (the western branch of the Kouenlun, see p. 439 in note), running parallel to the Western Himalaya, on the N. of the Indus, is undoubtedly more continuously lofty, and presents a greater breadth of elevated country than the Himalaya to the S. of it; and if, as is very probable, the eastern continuation of the Karakoram (to the N. of the Yaru or Tibetan Brahmaputra) is as lofty as the western, this will undoubtedly prove to be by very far a more lofty mountain chain than the Himalaya.

The mean slope of the Himalaya, from the plains of India to the average greatest elevation of the axis, is only 1 foot in 25; that from the loftiest peak (which is not on the axis) to the plains is 1 in 12. The elevation of the southern base of the Himalaya, that is, of the plains of India at the foot of the range, gradually rises from 350 feet in the meridian of Calcutta to 1000 feet in the Punjab; whilst to the eastward, up the Assam valley, the rise is scarcely appreciable. The elevation of the northern base in the western portion, that is, of the bed of the Indus, falls from 16,000 to 17,000 feet at the source of that river, to 11,000 at Ladak, and to 4000 or 5000 at its great bend. The elevation of the northern base of the eastern portion (that is, of the valley of the Tibetan Brahmaputra) is wholly unknown. At the source of that river it is no doubt from 16,000 to 17,000 feet, and it has been assumed to be 13,000 at Shigatzi;[1] while, according to the accounts of the climate of that part of Tibet where the Brahmaputra turns S., the elevation is probably under 6000 feet.

In estimating the mean elevation of the known parts of the Himalaya, it has been usual to take the elevation of the passes as data; but in so doing a distinction must be made between the passes over the axis and those over its subsidiary ranges. There is every reason to believe that from the W. of the meridian of Kashmir to the Peak of Kailas, no part of the watershed axis is much below 18,000 feet; the four known passes being all above that elevation. Further to the W., and N. of Kashmir, a remarkable depression occurs at Zoji-la Pass, which, being broad and only 11,000 feet elevation, recals some of the low *cols* over the main Alps. The elevation of the eastern part of the axis is entirely unknown. It has been but twice crossed; once by Captain Bogle in 1784, in his route to Tibet by Western Bhotan, but who left no record of his journey; and again by Turner in 1789. From the narrative of the latter we gather that the watershed itself is broad, open, and undefined to a common observer, though, from observations since made in the neighbourhood, it must be fully 17,000 feet elevation;[2] while the elevation of the axis N. of Sikkim may be assumed to be nowhere below 18,000 feet.

The principal peaks of the Himalaya are in many cases concentrated in groups, which have a definite relation to the chief rivers, being placed on the secondary ranges: thus, there are clusters or *nœuds* of snowy mountains between the sources of the Monas and Subansiri, with peaks of from 23,000 to 25,000 feet in height; between the Monas and the Pachu is another probably higher; westward of the Pachu is the enormous nœud, to the N. of Sikkim, with its many spurs, from which rise Chumulari (23,929 feet), Donkiah (23,176 feet), and Kinchin-junga (28,178 feet), with its supporters, Junnoo (25,312), Kubra (24,005 feet), Pundim (21,300 feet), and others; which clusters separate the head waters of the Pachu, Machu, Tista, and Arun. Between the Arun and Kósi is another great group, probably not lower than the last; between the Kósi and Gandak is the nœud from which rises Gosain-than (24,740 feet); between the Gandak and Gogra is another, with Dhawalagiri (28,000 feet). Of the peaks on the axis N. of the Sutlej, the Kailas alone has been measured, and exceeds 22,000 feet. On the subsidiary chain S. of that river are very many peaks of above 20,000 feet; of which Nanda Devi (25,700 feet), and Kamet (25,000 feet) are the two loftiest. W. of the Sutlej many peaks on and off the axis rise above 20,000 feet; and the last of the great snowed ones, Dhiarmal (18,000 feet), occurs W. of Kashmir, close to the bend of the Indus, and termination of the chain. These peaks are for the most part situated at some distance from the axis; and their accessibility, conspicuous position, and great quantity of snow, has fixed the attention of surveyors upon them: whether any eminences on the axis attain the elevation of 28,000 feet may be reasonably doubted. Of those to the eastward absolutely nothing is known; but from the views of the axis obtained from the N. of Sikkim, Nepal and Bhotan, it would appear that many there also exceed 20,000 feet.

The mineral character of the great peaks varies extremely; the loftiest known, Kinchin-junga, is apparently a stratified granite, whilst some of the first class are of gneiss, and others of limestone, of mica-schist, and of slate.

Climate.

In the Himalaya every variety of temperature may be met with, from a tropical heat to the cold of the poles; and every degree of humidity, from the perpetual moisture of the eastern valleys to the utter aridity of Western Tibet; nevertheless the greater part of the chain is so subject to the influence of the monsoons, which sweep along its flanks from the Brahmaputra to beyond the Sutlej, that the seasons in general correspond with those of the great Gangetic valley; and the two main divisions into hot and cold months, which further correspond with the wet and dry ones, may be traced in all parts of the range except in the driest Tibetan regions. After the commencement of the vernal equinox, brilliant weather prevails more or less in all parts of the chain, except in the eastern, where any continuance of cloudless weather is rare. The rains are ushered in by gales and thunderstorms; and when they have fairly set in, a cloudless week seldom occurs in the westward, and to the eastward is quite unknown.

---

[1] Hooker's *Himalayan Journals*, vol. ii., p. 171.

[2] The pass by which Turner left Bhotan, and entered the valley of the Machu in Tibet, is over a subsidiary range, and does not appear to have been of very great elevation.

Rain. In the Eastern Himalaya the rainy season commences in April or May, with the accession of the south-easterly monsoon, laden with humidity from the Bay of Bengal; by the end of May it becomes general in Nepal, and by midsummer in the extreme W. In the N.W. the rain begins to decrease about September, but in the eastern provinces can hardly be said to be over before October or November. The amount of rain deposited during this period varies extremely, but as a general rule, diminishes from E. to W. Owing to a local cause, Sikkim is the wettest province in the whole range—the Rajmahal Hills (in Bengal) partially dispersing the clouds which would otherwise descend on Nepal to the W. of it, and the Khasia range similarly sheltering Bhotan to the E. The heaviest rains fall on the outer hills, elevated from 6000 to 10,000 feet, especially where these advance in considerable masses towards the plains, whilst isolated peaks and ranges of less elevation, as well as the valleys of the great rivers, are drier. As a consequence of this, all the valleys of the interior which are separated from the plains by continuous chains, attaining an elevation of from 10,000 to 12,000 feet, are to a great extent sheltered by these from the rains, which fall only as occasional showers; while those still further back, and which are bounded on the south by mountains rising everywhere to the level of perpetual snow, are absolutely without rain during the monsoon. In Sikkim and Bhotan, where the wide valleys are perpendicular to the axis of the chain, and correspond to the direction of the winds, the rains are heavy till we penetrate far into the interior; but great irregularities everywhere occur, and this even in adjacent valleys.

The maximum rain-fall probably occurs on the outer ranges of Sikkim, and exceeds 120 inches in the year at 7000 feet elevation. The amount of rain is, however, little indication of the humidity of the climate; for, though in the interior valleys very little falls at elevations corresponding with those which are deluged on the outer ranges, the fogs and drizzle which prevail, and which are not measured by the rain-guage, sometimes obscure the sun's rays for many days in succession.

Winds. Towards the autumnal equinox, as the decreasing declination of the sun gradually changes the direction of the wind, the atmosphere becomes drier, and the cessation of the rains is marked by violent tempests.

During the winter the weather is unsettled; for whilst the N.E. monsoon is blowing over the lower parts of India, an upper current of south-westerly wind carries its moisture to the higher mountains, where it is condensed in the form of snow; and there is also a short rainy season towards the end of December, in the more humid provinces. In spring, as the sun's declination increases, and the Gangetic plain and Punjab again become heated, low currents of dry south-westerly winds often rush in the afternoons with violence up the Himalayan valleys, and obscure the distant prospect with a strong haze.

The local Himalayan winds are confined to a diurnal current of heated air which rushes up the valleys during the day, and is always experienced on the axis of the chain as a violent southerly wind; and a return cold current at night, blowing with much less violence and regularity down the valleys. These winds increase in regularity and intensity as the valleys are ascended, and as the difference increases between the temperatures of day and night; the diurnal current being least marked in winter, and the nocturnal one in summer. The other phenomena of cloud, rain, and fog, which prevail in the Himalaya, are common to all mountain countries, and require no detailed account.

Temperature. The mean temperature of the base of the Himalaya diminishes from 74° in the meridian of Calcutta, to about 70° in the western extremity of the range. At that end it is not so low as the increase of latitude would indicate, owing to the increase of the mass of land in that direction, which becomes excessively heated in summer; hence the isothermals are curved, with their convexity to the N.W. during all seasons of the year, but most so in summer, as the equator of heat trends so far to the northward of the terrestrial equator in summer as to impinge upon the base of the Himalaya in July, when its mean temperature rises almost to 86°. In midwinter again the mean temperature falls to about 60°.

The diminution of temperature in ascending is about 1° for every 350 or 400 feet of elevation in the more humid parts of the chain, and 1° for every 400 feet in the drier parts; the ratio of diminution is most rapid in the loftiest elevations, and more rapid in winter than in summer, owing to the effect of the warm S. wind. In these respects the Himalaya differs from other mountain ranges, as the Alps for instance, as it does also both in the annual and diurnal range of temperature increasing with the elevation, and in the effect of radiation being greatest in winter, all of which are due to the interference of the heavy rains and clouds of summer.

The following is an attempt to approximate (within a few degrees), to the mean temperature, and range of the thermometer, in the province of Sikkim:—

Altitude.	Mean temp. in Shade.	Mean warmest month.	Mean coldest month.	Mean daily range of temperature.	Rain-fall in inches.	Ratio of diminution of temperature.
7,500 feet	50·	62·7	40·0	13·0	120·0	1°=300 feet.
11,000 ...	40·9	50·0	24·0	20·0	40 0	1°=320 ...
15,000 ...	29·8	40·0	11·0	27·0	20·0	1°=350 ...
19,000 ...	19·8	32·0	0·0	35·0	10·0	1°=400 ...

Snow-line. The elevation of the snow-line is about 16,000 feet on the southern or outer snowed ranges throughout the whole length of the chain; the depression at the eastern extremity, which is in a lower latitude, being attributable to the convexity of the isothermals and the greater fall of snow. It rises to 20,000 feet on the loftier eminences towards and behind the axis. In winter the snow descends to 10,000 feet, and lies there for about a month, probably throughout the range; and sporadic falls have been experienced as low as 5000 feet in the central provinces, and 1000 in the western.

The glacial phenomena are everywhere the same as in the Alps of Europe and elsewhere, the descent of the glaciers being modified by the breadth, form, and slope of the valleys they occupy, and the extent, &c., of their feeders: in the Western Himalaya they descend to 11,000 feet, though rarely; while in the eastern and central parts they have not been met with below 14,000.

That the climate of the whole Himalaya has been greatly altered within a comparatively recent period, is proved by the ancient moraines of great size, and other glacial evidences, which are found as low down as 8000 or 9000 feet in the valleys of all the great rivers.

The barometric tides in the Himalaya are greatly modified by the rains; but the times of maximum pressure (9·50 A.M. and P.M.) and minimum (4 A.M. and P.M.), and the horary oscillations, are much the same at all elevations. The amplitude of the oscillations decreases from 0·100 inch at the base of the range to 0·074 at 7500 feet, and 0·050 at 14,000 or 15,000 feet. The amplitude is greatest in the spring months, least in June and July, and rises again in autumn. The pressure of dry air shows but one annual maximum (in December) and one minimum (in July), and one diurnal maximum at the coldest hour of the twenty-four, and one diurnal minimum in the afternoon.

Atmospheric pressure.

The effects of diminished pressure on the human frame are the same in the Himalaya as in other mountain regions; the uninured traveller first experiences slight giddiness at 13,000 or 14,000 feet, with nausea, headache, and lassitude at 14,000 or 15,000, while the pulse often rises to 120 per minute—symptoms which increase with the elevation, and violently so upon any exertion, but wear off with practice. Upon horseback, if the pace is gentle, 19,000 feet may be attained without inconvenience; and after living for a day or two at 16,000 feet, ascents to 20,000 feet may be made slowly and cautiously on foot, without other inconvenience than lassitude. Some individuals suffer more than others, but even the Tibetan inhabitants of 15,000 feet always have headache in walking over passes of 18,000. Bleeding at the nose and ears has never been experienced by any practised traveller in health, and is unknown amongst the natives.

Geology of the Himalaya.

Of the *Geology* of the Himalaya little can be said; for though some of the provinces have been well studied, of the majority nothing whatever is known. The strike of the rocks throughout appears to be N.W., and the dip N.E.; but this is liable to many local exceptions, the dip especially being extremely variable. At the south base of the range, spurs of sandstones and conglomerates occur, rising immediately out of the gravelly deposits which are intercalated with the alluvium of the plains of India. These sandstones have been represented as occurring along a great portion of the range, though there is no evidence to show that those of the eastern and western parts of the chain are of the same age. Some of those of Kumaōn (Sewaliks) are referable to the miocene age, and contain the remains of species of bos, camel, giraffe, hippopotamus, dinotherium, mastodon, sivatherium, many antelopes and other ruminants, various carnivora, anoptotherium, several monkeys, seven species of elephants, crocodiles, and the gigantic tortoise, whose shell measures 20 feet across. The sandstones at the foot of the Sikkim hills in the meridian of Calcutta are probably referable to the same age as the coal formations of Behar and Central India, indications of similar fossils having been found in both. The dip of these rocks is almost always to the mountains, as is often that of the succeeding metamorphic rocks, and which, though probably of far older formation, appear to overlie them.

Metamorphic rocks, consisting of beds of mica-schist with garnets, clay-slate, quartz, gneiss, and occasional veins of granite, acquire an enormous development, often rising into the loftiest peaks of the central region, and forming the mass of the mountains in those parts of the range which have been best explored. These are overlaid again by slates, and in Kumaōn by Silurian beds succeeded by rocks which are referable to the oolite series, abounding in some places in ammonites and belemnites.

In the larger river valleys towards the axis of the chain, tertiary beds are again met with, overlying the oolitic and metamorphic ones, and containing, to the north of Kumaōn, at 15,000 feet elevation, fossils analogous to those of the Sewaliks, at the south base of the mountains. Specimens of these, brought to England by Captain R. Strachey, have been referred to extinct species of horse, rhinoceros, elephant, hippopotamus, &c.

Of eruptive rocks granite is abundant throughout the chain, and dykes of greenstone and basalt occur to the westward. In the extreme Western Himalaya of Tibet, fossil shells of the pleistocene or post-pleistocene age, have been found in lacustrine clays by Dr Thomson, on the flanks of mountains bordering both lakes and rivers, high above the level of the waters; some of these, chiefly species of *Lymnæa* and *Planorbis*, are closely allied to existing Himalayan species, if not identical with them, and indicate the retirement of extensive bodies of fresh water from those regions at a comparatively recent period. Glacial deposits are found in all the Himalayan valleys above 8000 or 9000 feet elevation, in the form of transported boulders and enormous moraines, attesting the former extension of glaciers fully 6000 feet below their present limits. These phenomena so entirely resemble those of the Alps, that they require no detailed account.

Attempts have been made to draw conclusions in physical geography and geology from the relations of the river-beds (regarding them as fissures) to the strike of the rocks in the chain, and to the lines of upheaval of the main and subsidiary ranges, but hitherto without success. One fact alone is obvious, that the direction of the strike, which appears to be tolerably uniform throughout about 1000 miles of the chain, cuts both the main range and its secondary ones obliquely at an acute angle, and is not modified by the varying direction of the range; whence it follows that it cuts the river basins obliquely also. Until, however, more is known of the relative ages of the rocks composing the range, and their exact relations to one another, no conclusions can be arrived at. The order of superposition has been traced in Kumaōn alone, by Captain R. Strachey; and though the geology of this province will no doubt soon be connected with that of the countries to the westward of it, there is at present no prospect of any addition being made to our knowledge of either the geography or geology of by far the more extensive portion of the Himalaya, which stretches for 1000 miles E. of that province.

Minerals.

In mineral products the Himalaya is remarkably poor, so far as is at present known. There is nothing which can compare in abundance or value with the mines of the Ural, Andes, or European Alps. Red hæmatite is worked with profit in Kumaōn, and copper exists in Nepal and the Sikkim hills. Iron (disseminated) occurs in various places, and graphite is common. Salt, borax, and soda are procured in abundance in the dry climate of Tibet, where they are articles of commerce; there also gold-washing is carried on upon a most limited scale. Gold is known to be extremely abundant in many parts of Eastern Tibet, where, however, the jealousy of the Chinese government prevents its being worked. Slates, lime, gypsum, lead, sulphur, and magnesia, are also Himalayan products.

There is a surprising and almost total absence of gems, or minerals of rarity or beauty in the Himalaya; garnets, actinolites, and tourmalines, are perhaps the only exceptions of frequent occurrence, and these are of the coarsest description.

Hot springs abound, chiefly at elevations of 10,000 to 18,000 feet; they usually emit sulphuretted hydrogen gas, and maintain temperatures of 100° to 130°. There is no active volcano anywhere in the range, nor any traces of extinct ones. Some of the districts, especially towards the N.W., have been visited by violent earthquakes, but these do not appear to be connected with any endemic phenomena; they have generally commenced far S. of the Himalaya, and have been propagated across the range. Remarkable local subsidences and elevations have occurred in the valley of the Jhelam in Kashmir, which have been described by Dr Thomson (*Tibet*, p. 291).

Vegetation.

Vegetation.—This may be altitudinally divided into tropical, temperate, and alpine; and latitudinally into exterior or rainy, interior or intermediate, and Tibetan or arid Himalaya.

The tropical belt extends from the Terai to 6000, and even 7000 feet in the humid central provinces; and to 3000 to 4000 in the extreme western. It consists of a luxuriant forest of Malayan and insular types of trees in the eastern provinces, which to a great extent disappear to the westward, where they are partially replaced by Persian, Egyptian and Afghanistan types—amongst these trees the palms, plantains, tree-ferns, sal (*Shorea robusta*), sissoo (*Dalbergia sissoo*), toon (*Cedrela Toona*), and some oaks, are the most conspicuous, and commercially the most important, especially to the eastward.

The temperate belt extends from 5000 feet to the upper limit of forest, which varies from 12,000 to 13,000 feet, according to the dryness of the climate. It abounds in European, Levantine, and Chinese genera and even species, with but few Malayan mountain ones; of these the European are most abundant in the western provinces, and the Chinese and Japanese in the eastern, where are also a few American genera, and some belonging to the Malayan and insular mountain flora. Amongst the most conspicuous plants of this region are oaks, birch, maple, apple, hornbeam, poplar, ash, cherry, alder, celtis, pine, juniper, yew, willow, and pines (*Abies Webbiana* and *Brunoniana*), which abound throughout the range; besides which, there are to the westward of Nepal, deodar, *Pinus Gerardiana*, hawthorn, cypress, horse-chestnut, olive, myrtle, evergreen oak, sloe, black poplar, and many other European genera and even species; whilst to the eastward, laurel, magnolia, rhododendron, larch, *Abies Brunoniana*, and chestnut, more especially prevail.

The alpine belt, which commences above the forest region, ascends in extreme cases to 19,000 feet; it abounds in Siberian, Polar, and European alpine plants throughout the whole extent of the chain, the European species and genera being most prevalent to the W.

Several hundred common English plants are also natives of the Himalaya, and especially of the temperate and alpine zones; and the total number of flowering plants inhabiting the whole range probably amounts to 5000 or 7000 species.

Cultivation in the Himalaya is carried on as high as 14,000, and even 15,000 feet, where summer crops of wheat and barley exist in Tibet, but quite exceptionally; also buckwheat, turnips, radishes, mustard, potatoes, and various pulses, are grown abundantly between 8000 and 12,000 feet, as summer crops. Rice, maize, millet, and other tropical cereals, are grown below 6000 feet, with buck-wheat, and various species of chenopodium, yams, capsicum, egg-apple, legumes, and sugar-cane.

The Himalayan fruits cultivated by the natives in the eastern and central provinces are plantains, oranges, pineapples, walnuts, indifferent peaches and apples; in the western, excellent apples, pears, apricots, peaches, cherries, mulberries, grapes, and walnuts.

The cultivation of tea is now successfully carried on on a large scale in the Western Himalaya, at elevations of 2000 to 5000 feet, and might probably be pursued with more or less success in all parts of the chain.

The timber trees of the Himalaya are extremely numerous, but few of them are of great value, and some of the best inhabit inaccessible regions. The sal (*Shorea robusta*) is decidedly the most valuable; and, from growing at the foot of the hills, close to water-carriage, is the only one much felled for export. The toon (*Cedrela Toona*) and sissoo (*Dalbergia Sissoo*) are also exported from the same regions; and the deodar and other conifers from the north-western provinces. The other pines, the walnut, oaks, and the chestnuts, mostly produce indifferent timber; but, though there are exceptions, the use of these is principally confined to the neighbourhood where they grow. Of ornamental woods, few are known, and none are in general use. Bamboos prevail everywhere, and rattan-canes to the eastward. Owing, probably, to the humid climate, the woods of European genera are, almost without exception, inferior to those of their western allies. Teak is unknown in the Himalaya; and the other woods of Eastern Bengal and of both the Indian peninsulas are either confined to the malarious forests of Assam, or are altogether absent. The vegetable economic products are also very few and unimportant—such as spices, gums, resins, oils, waxes, fibres, and other textile materials. Of drugs, the baneful aconite and hemp are the best known; inferior rhubarb, and a few bitters of secondary importance in the pharmacopœia, are also collected for export. Attempts have been made to cultivate drugs for the use of the Indian medical establishments, but hitherto with very limited success. Wild madder is extensively collected and exported, as are bamboos, canes, and a few other products; and latterly potatoes in Sikkim. There is no doubt that the vegetable riches of these extensive regions are but very little known, and are capable of immense extension; but hitherto the efforts have been limited. On the northern or Tibetan parts of the range the trees are extremely few and small, and confined to willows, poplars, junipers, elæagnus, and tamarisk; and of bushes, the well-known dama or furze, that supplies fuel, is the most familiar to travellers.

Zoology.

The *Zoology* of the Himalaya is very extensive, and the laws of distribution are the same as those of the vegetable kingdom; thus Malayan genera of quadrupeds, birds, and insects, inhabit the tropical belt, diminishing in variety and number towards the west. In the temperate zone European types predominate, with a large admixture of Chinese and Japanese forms to the eastward. Siberian forms prevail in the alpine zone, and throughout both eastern and western Tibet. The most remarkable animals are in the tropical zone; the tiger, leopard, elephant, rhinoceros, buffalo, and many species of deer, monkey, wild boar, and bovine animals. In the temperate zone are other species of deer and monkey, bears, wild cats, squirrels, &c. In the alpine zone, and chiefly in the Tibetan climate, the wild ass or kiang, musk-deer, ibex, antelopes, hare, several wild sheep and goats, marmot, lemming, fox, wolf, ounce, lynx, weasel, polecat, and many smaller animals, abound. The domestic animals are the yak and its hybrids with other bovines, ponies, cows, sheep, pigs, dogs of a mastiff breed, goats, and fowls, and occasionally bees; of these the yak is the most remarkable, and is the domestic form of a wild animal of greater dimensions found in various parts of Tibet; it is used as a beast of burden for all purposes, for milk, and for beef.

Shells are rare in the Himalaya, but do exist, and even at 16,000 to 17,000 feet elevation, in fresh water.

Insects are extremely abundant at all elevations, and leeches abound up to 10,000 feet in the eastern provinces.

The rivers are generally too rapid for much fishing; but many species of *Cyprinidæ* especially abound from the level of the plains to 15,000 feet elevation; with a remarkable break, however, between 5000 to 10,000 feet, between which levels fish are said to be rare, or almost unknown, in most of the rivers. *Salmonideæ* are unknown in any Himalayan river; the so-called trouts being all species of carp. The eastern Tibetan lakes swarm with fish at 10,000 to 14,000 feet elevation.

The economic animal products are coarse silk, called tusser, from a native moth bred at the foot of the hills; shawl wool from Tibet, and musk from the alpine regions.

Inhabitants.

It is impossible to make more than a brief allusion to the numerous Himalayan races, whose very numbers are as yet unknown, and the origin of most of which is involved in obscurity. The majority, however, may be safely referred to the Mongolian race, with, in some cases, more or less of admixture with the Indo-Germanic. Of these the Tibetans are perhaps numerically the greatest; and they occupy the largest area—namely, Eastern Tibet, which is exclusively peopled by them, Western Tibet to a great extent, and all the loftier Himalayan valleys above 8000 feet elevation. They are generally an honest, hardy, hospitable, cheerful people, but indolent, unwarlike, and filthy in the extreme, both in their persons and houses. All are Lama Buddhists. The Bhotanese are perhaps more closely allied to these than any other Himalayan race, and are also all Lama Buddhists. They are more industrious than the Tibetans, but are turbulent, treacherous, dishonest, and sullen in disposition. The Nepalese are chiefly Hindus, as are many of the dominant races of the lower outer Western Himalaya, and are divided into many castes or classes, military, agricultural, pastoral, &c. Throughout the Western Himalaya are many Mussulmen. Numberless uncivilized tribes inhabit the eastern and central provinces; but, with the exception of the Abus of Eastern Bhotan, none are in an absolutely savage state. The others are the Lepchas, a timid Mongolian race inhabiting Sikkim, and the Limboos, Murmis, Haioos, Cooches, Bodos, Dhimals, and a host of other tribes, presenting various combinations of the Indo-Chinese, Mongolian, and Tamul, or aboriginal race of India. These chiefly inhabit the eastern provinces, and, with the exception of the Lepchas, none form a distinct nation; the rest are mixed off with the Nepalese, Lepchas, and Bhotanese, and are subject to the sovereigns of these tribes. Some of these are the remnants of the aborigines of the Himalaya, and claim a very early origin. For detailed information on these subjects, and on the zoology in general, we must refer to Mr Hodgson, whose works on these subjects have a European reputation.

ritish sta-
ons.

The principal British stations in the Himalaya are situated at elevations of 6000 or 8000 feet above the sea level, where the climate approximates to that of England. These are all healthy, and well adapted to the European constitution; and though neither objects of particular solicitude nor of sufficiently systematic resort by the British residents in India, they are of the highest value, and the conviction of this is gradually forcing itself upon the public mind. Whether as a means of civilizing the neighbouring hill-states, or of extending our commercial relations with Tibet and Central Asia, or as affording healthy sites for schools, hospitals, and depôts for invalid or unseasoned troops, they are worthy of the especial care of the government. It cannot be doubted that the Himalaya will one day become peopled by colonies of the English race, sprung in part from officers of the East India Company's service, and others who, long accustomed to the habits of the East, and with all their friends and associations in India, prefer a retirement in the immediate neighbourhood of the scenes and friends of their later life, to seeking new friends, and remodelling their habits in England. Of these hill Sanataria, the most important, proceeding westerly, are—Darjiling, elev. 7000 to 8000 feet, in Sikkim; Naini-tal, 6000 to 7000 feet, and Almora, 5000 to 6000 feet, in Kumaōn; Masuri, 6000 to 7000 feet, in Garhwal; Simla, 7000 to 8000 feet, in Sirmore; Kangra, 7000 to 8000 feet, in the Byas Valley; and Murree, 7000 to 8000 feet, between the Indus and Jhelum. (J. D. H.)

HIMERA, *in Ancient Geography*, a great Greek city on the northern coast of Sicily, at the mouth of a small stream about halfway between Panormus and Cephalædium. It was founded by a colony from Zancle, and its institutions were consequently at first Chalcidic; but there seems to have been also a considerable infusion of Syracusan blood. The date of its foundation, which is not accurately known, is generally assigned to the year 648 B.C. In its early history the only recorded event is its temporary subjugation by the tyrant Phalaris. It next fell under the power of a tyrant of its own, Terillus by name, who was expelled by Theron of Agrigentum. In his distress Terillus applied for aid to the Carthaginians. That people having probably in view the conquest of the whole of Sicily, sent him an immense army, who, in the same year, and it is said on the same day which witnessed the route of Marathon, were utterly annihilated by Theron with the assistance of the Syracusan Gelon. The successful tyrant now entrusted the government of the city to his son Thrasydæus, and augmented its diminished population by a colony of Dorian settlers. From this time Himera became Doric both in its constitution, dialect, and policy. After the death of Theron in 472, Thrasydæus was expelled from Himera, which continued to grow in power and wealth till its final destruction by the Carthaginians in B.C. 408. Near the site of the old town the conquerors founded a new one, to which, from the hot wells in the neighbourhood, they gave the name of Thermæ or Thermæ Himerenses, which from its favourable situation soon attained considerable importance as a commercial mart. Even so late as the days of Cicero it was a place of some importance, as is attested by the extensive Roman remains of that period still extant. The name of the town is preserved in that of the modern Termini which occupies its site. Himera was the birthplace of the poet Stesichorus, whose statue, preserved in Thermæ, is mentioned by Cicero as being held in the highest veneration by the natives.

Himera, *in Ancient Geography*, the name of two important rivers of Sicily. The less important of the two was the Northern Himera, falling into the sea near the city of that name. It rose about the centre of the island not very far from the sources of the Southern Himera, and is by some identified with the modern *Fiume di Termini*. Others, however, are of opinion that the Northern Himera is now represented by the *Fiume Grande*, which falls into the sea about 8 miles E. of Termini. The Southern Himera rose in the Mons Nebrodes (*Monte di Madonia*), and flowing nearly due S., fell into the sea at Phintias (*Alicata*). It is now called the *Fiume Salso*, or Salt River. On its banks Agathocles was defeated by the Carthaginians, B.C. 311, and they by Marcellus, B.C. 212.

HIMILCO, the name of several persons distinguished in the history of Carthage. The first of whom mention is made was the leader of the expedition which set out to explore the northern seas at the same time that Hanno undertook his famous voyage in the opposite direction. Nothing remains to fix the period at which it was undertaken.

Himilco, the opponent of Dionysius the Elder, of Syracuse (406–368); and Himilco, the opponent of Marcellus in Sicily, are deserving of notice. See Carthage.

HINCKLEY, a market-town of England, county of Leicester, and 13 miles S.W. of the town of that name. The parish church is a spacious old building, surmounted by a lofty spire, and having a finely carved oak roof. Cotton and woollen hosiery constitutes the staple manufacture of the town. Market-day, Monday. Pop. (1851) 6111.

HINDIA, a town of Hindustan, in the territory of Gwalior. The district of which it is the capital has been placed under British management by the provisions of the treaty of Gwalior concluded in 1844; its revenues being appropriated to the maintenance of the Gwalior contingent, a native force commanded by British officers. The town is fortified, and stands on the left or S. bank of the Nerbudda.

HINDU COOSH, or Koh, a range of mountains, physically discriminated from the Himalayas by the vast depression which forms the upper part of the valley of the Indus. They form the N.W. boundary of the province of Caubul, separating it from Balk and Buduckshan. The range of mountains so denominated extends in a westerly direction from Long. 78° as far as the snowy peak of Hindu Coosh, nearly N. of Caubul. These mountains are covered with snow the greater part of the year, and void of verdure at the summit, but are well wooded at the base. They form the Indian Caucasus range of the ancients.

HINDUSTAN.

HINDUSTAN has from the earliest ages been celebrated as one of the most highly favoured countries on the globe, and as abounding in the choicest productions both of nature and art. In ancient times, this distant region was very imperfectly known to the Greeks and other nations of the West; but they imported its most valuable produce, its diamonds, its aromatics, its silks, and its costly manufactures. The country which abounded in those expensive luxuries was naturally reputed to be the seat of immense riches, and every romantic tale of its felicity and glory was readily believed. In the middle ages, an extensive commerce with India was still maintained through the ports of Egypt and the Red Sea; and its precious produce, imported into Europe by the merchants of Venice, confirmed the popular opinion of its high refinement and its vast wealth. After the discovery of a passage to India by the Cape of Good Hope, the same ideas still prevailed; and the maritime states of Europe contended with their fleets and armies for the dominion of the Asiatic seas, and for the commerce of the country. The Portuguese, and afterwards the Dutch, made important conquests, and carried on an extensive trade. In later times, Great Britain and France appeared on the field as competitors for the prize of Indian commerce and dominion, and were allowed to establish factories on the coasts for the reception and the store of goods. These were gradually converted into military posts, defended by soldiers and cannon; and in due time those two powers were ranged on opposite sides in all the wars and politics of India. This contest terminated in the triumph of the British arms. France lost her pre-eminence on the continent of India; and her great rival, enlarging her power on every side, gradually rose to greatness and dominion, and now rules with undisputed sway from the Himalaya Mountains to Cape Comorin. This vast extension of the British power in the East has opened the way into the interior of India. It has tended greatly to enlarge our knowledge of this distant region; and if more accurate inquiry has reduced the marvellous tales of its glory and greatness within the bounds of sobricty and truth, Hindustan, the seat of industry, of commerce, and of the arts, when Europe was sunk in barbarism, the scene of many eventful revolutions, from the Mohammedan invasion till its conquest by the armies of Britain, and inhabited by a people of peculiar manners, laws, institutions, and religion, still presents a wide field for interesting inquiry and speculation.

In the following account of this interesting country, we propose to describe—I. Its geography and natural features; its produce, its animals, its manufactures and commerce; the numerous races by which it is inhabited, with their manners, religion, and policy; and the wars and political revolutions which have terminated in establishing the sway of Great Britain over nearly the whole continent of India. II. The transactions and internal policy of the East India Company, with the various reforms introduced into the revenue, judicial, and police departments, will afford ample materials for a separate discussion and inquiry. III. A brief account will be given of the constitution, commercial privileges, and pecuniary transactions of the Company, originally merchants, now the sovereigns of a vast empire.

Geography.

I. The ancient geographers had no precise ideas of the extent of Hindustan or India, terms which we mean to use synonymously in the following article; and they accordingly extended its frontier westward as far as Persia, and eastward to China. In after ages its limits often fluctuated with the events of war, and served only to mark out the course of conquest, with little or no attention to geographical accuracy. Yet in no part of the earth has nature pointed out, in the great features of the country, more distinct and magnificent boundaries. On the N. it is separated from the elevated table-land of Thibet by the precipitous wall of the Himalaya Mountains, the highest land of the Asiatic continent; on the W. the Suliman range, a continuation of the Sufeid Koh Mountains, separates it from Afghanistan and Beloochistan; its E. boundary is formed by parallel offshoots from the opposite extremity of the Himalayas and by the continuous ranges of forest-covered hills, which, skirting the Bengal district of Chittagong, stretch southward to the recently acquired province of Pegu, and separate the British dominions from the territory of Burmah. The Indus and the Ganges discharge themselves into the ocean on the western and eastern coasts of Hindustan, in about N. Lat. 24° and 22°; and to the south the country is contracted into an irregular triangle, projecting into the Indian Ocean to within eight degrees of the equator, or about 1000 miles, and on all sides inclosed by the sea. The extensive region situated within these limits is nearly comprehended between the 8th and 35th degrees of north latitude, and between the longitudes of 66° and 99° east; and its length from the northern barrier of the Himalaya Mountains to Cape Comorin is about 1900 miles, whilst in breadth it may be estimated at 1800 miles, though, owing to the irregularity of its figure, it does not exceed 1,484,367 English square miles.

Natural features.

Hindustan is of an extremely diversified aspect, and comprehends within its bounds all the varieties of climate, of soil, and of natural scenery, from the bare and naked rock, and lofty mountain buried under eternal snows, to the low and fertile plain, scorched by the tropical sun, and the seat of luxuriant vegetation. This diversity in the aspect of the country has given rise to the following territorial divisions, namely:—

1. Northern Hindustan, which comprehends the Himalaya Mountains on the N., with their lower ranges of hills stretching southwards to the plains of the Indus and the Ganges, and extending from Peshawur and Cashmere on the W., to Bootan and Assam on the E.

2. Hindustan Proper, which extends southward as far as the Nerbuddah River, where the Deccan commences. and which includes the lower provinces of Bengal, the north-western provinces, together with Oude, Malwa or Central India, the Punjab, Guzerat, Sinde, and Cutch.

3. The Deccan, bounded on the N. by the Nerbuddah River, and on the S. by the rivers Krishna and Toombudra, comprehends the larger portion of the presidency of Bombay, together with Orissa, the Nizam's dominions, and the territory of Nagpore.

4. India south of the Krishna River, comprehending the territories under the administration of the government of Madras, together with the native states of Cochin, Travancore and the Mysore.

The alpine region of Hindustan, which forms its northern barrier, is a narrow strip of land not exceeding 150 miles in breadth. It is here that the land of Asia attains to its height; and the country is composed of a succession of vast mountains rising far above the level of perpetual snow. These frozen deserts consist in many places of rugged and bare rocks, shooting aloft into the sky, and divided by deep ravines, very steep, and often ending in dark chasms, which are sometimes wooded, but as often bare rocks several hundred feet in height, with little more space between them than has been worn by the violence of the torrents. Here is concentrated all that is sublime in the scenery or phenomena of nature. On every side are to be seen snowy summits of stupendous height, and of every form; the conical volcanic peak; the mountain regularly rounded, or broken into rugged and frightful precipices, rising upwards to a tremendous height, or descending with a frightful declivity into deep hollows, and all covered with snow. This mountainous and frozen region is the scene of the destructive avalanche, when the accumulated snows of successive winters are precipitated from the mountains into the plains below, burying everything in their progress; or when the action of the intense cold upon the solid rock rends it from its base, and sends it bounding down the steep, producing the most fearful ruin of everything beneath. Mr Moorcroft, who in the year 1816 penetrated across the Himalaya ridge, mentions the tremendous crash from the fall of a rock, which he heard at a great distance. The slope of a hill he also saw broken from top to bottom. "In its fall," he observes, "it has overwhelmed large trees, of which some have been hurled into the river, others lay across its bed half buried in rubbish, and others, thrown down, were seen hanging by their roots with their heads towards the base of the mountain." The southern face of the Himalaya Mountains is much more steep than the northern descent into the tableland of Thibet, and it is in proportion difficult and dangerous. There is nothing like a road in these mountainous districts. The traveller has to scale the most terrific heights, by a path so narrow as not to admit two abreast, which winds along the mountain, and often along bare and perpendicular precipices by a narrow and irregular flight of steps, or by natural irregularities in the face of the polished marble rock, and sometimes by a projecting ledge not more than a foot broad, whilst a declivity of 600 or 700 feet in depth opens on the outer side. These steps, at certain projecting points, where the rock is perpendicular, wind in lines of zigzag not more than ten or twelve feet in length, at angles so sharp that, in a length of twenty-four feet, the actual height gained is not more than ten feet, and they are often placed at most inconvenient distances, which greatly increases the danger and the difficulty of access, except to those hardy mountaineers who have been trained from their infancy to agility and steadiness in such tremendous paths. Mr Moorcroft himself had on one occasion a narrow escape. "My left foot," he says, "having slipped off one of these irregularities, I lay for a few seconds upon the poise; but a snatch at a clump of grass, which on being seized did not give way, and a sudden spring, brought me to a comparatively safe spot, with the loss of some skin from my knees and elbows, and some rents in my trowsers and sleeves."[1] His Hindu attendants encountered the same perils, and one of them had very nearly fallen down the precipice. On missing his footing, he mentions that "he shrieked violently, and sunk down almost senseless upon a point of stone, with one leg hanging over the abyss, calling out that he was lost." Another of the bearers was so alarmed that he was incapable of proceeding until he was secured by a turban tied round his waist, and held by one of his companions. In some places the rock was found to project to the edge of the river, and it was turned by rude staircases made of wood and stone, or the path lay over immense stones and rocks, piled up in dangerous disorder, where it was very difficult to secure a footing; whilst in other places the party had to aid their ascent by laying hold of shrubs, roots of trees, clumps of grass, and clods of earth, or by creeping on both hands and knees to prevent slipping down. Yet the heavily loaded native carriers, each carrying a weight o 60 pounds, are seen descending these difficult passes with apparent ease and unconcern.[2] Lieutenant Webb, who in 1808, along with Captains Raper and Hearsay, was sent to explore the sources of the Ganges, experienced the same dangers as Mr Moorcroft, and was finally compelled to desist from his hazardous journey when he had reached within six or seven days' journey of Gangoutri. The country here assumes a savage wildness, and, except in the passes or beds of the rivers, is totally impervious; and these rivers, in approaching their sources, from rapid and turbulent streams flowing over a rocky channel, become furious torrents dashing from one huge block of stone to another, along which the traveller, climbing over rocks, or picking his dangerous way along the path of precipices, as already described, is at last met by masses of mighty ruins, which entirely check his further progress. More recently these wild regions have been explored by that enterprising traveller Dr Gerard, who crossed the great Himalaya Pass, and penetrated into the Plateau of Tartary. The abstract of his tour, given in the Asiatic Journal, is replete with valuable information, and confirms all the previous accounts of travellers respecting the nature of the country, rude and inaccessible, and exhibiting, on a scale of grandeur hardly to be conceived, all the great phenomena of nature.

The Himalaya Mountains contain the sources of the great rivers which flow through the burning plains of Hindustan. The deep valleys between the mountains are the channels through which the waters flow from the higher grounds; and, by the melting of the snow, those streams, suddenly swollen into torrents, and rushing down the declivity, work out a deep and narrow channel amongst the rocks, where, imprisoned as it were between steep and perpendicular banks, they roar and foam amidst precipices, or in dark and unfathomable glens, exhibiting, in the conflict of their troubled waters, all the great phenomena which belong to rivers, namely, the cataract, the rapid, the boiling eddy, and the dangerous whirlpool, and only subside into smoothness when they break out and spread over the plains. Huge rocks were seen by Dr Gerard whirled along with frightful velocity; nothing visible but an entire sheet of foam and spray, thrown up and showered upon the surrounding rocks with loud concussion, and re-echoed from bank to bank with the noise of the loudest thunder. Across these streams are thrown rude bridges made of ropes or of wood, the usual expedient by which rivers are crossed in all mountain countries. Where the breadth of the river is small, the passage is effected by one or two fir spars laid across from rock to rock; but where the space is wider, a bridge of ropes is constructed, on the principle of the chain bridge. In attempting the passage by one of these rude bridges, a carrier who accompanied Fraser in his journey to the sources of the Ganges unfortunately lost his footing and fell into the water. He was instantly swept down the stream to its junction with the Bhagiruttee, about fifty yards, "when his head," says the traveller, "appeared for a moment, and his load floating beside him; but the foaming current of the Bhagiruttee, here tumbling over large rocks with a mighty roar, seized him and hurried him along with its tremendous torrent."

The greatest height of the Himalaya range has been fixed by accurate measurements at upwards of 28,000 feet above the level of the sea. According to the accounts of all travellers, these mountains present from the plains below one of the sublimest aspects in nature, and they are at a loss for words to express the admiration and awe with which they are at first beheld. Bishop Heber mentions that the nearest range rises into a dignity and grandeur which he was not prepared for, divided as it is into successive ridges, in all the wildest and most romantic forms of ravine, forest, crag, and precipice. In his further progress he found "one range of mountains after another quite as rugged, and, generally speaking, more bare than those which we had left, till the horizon was terminated by a vast range of ice and snow, extending its battalion of white shining spears from east to west, as far as the eye could follow it; the principal points rising like towers in the glittering rampart, but all connected by a chain of humbler glaciers." Captain Raper, who accompanied Lieutenant Webb in his survey of the Ganges, viewed the Himalaya ridge from a summit about 4000 feet above the lower plain. "From the edge of the scarp," he observes, "the eye extended over seven or eight distinct chains of hills, one rising above the other, till the view was terminated by the Himalaya or Snowy Mountains. It is necessary for a person to place himself in our situation before he can form a just conception of the scene. The depth of the valley below, the progressive elevation of the intermediate hills, and the majestic splendour of the cloud-capt Himalaya, formed so grand a picture, that the mind was impressed with a sensation of dread rather than of pleasure."[1] "The stupendous height of those mountains," says Elphinstone, "the magnificence and variety of their lofty summits; the various nations by whom they are seen, and who seem to be brought together by this common object; and the awful and undisturbed solitude which reigns amidst their eternal snows, fill the mind with admiration and astonishment that no language can express."[2]

[2] Fraser, *Journal of a Tour through part of the Snowy Range of the Himalaya Mountains.*

Northern Hindustan varies in its climate and in its aspect with the height of the ground. The lower ranges of mountains, though they scarcely reach the level of perpetual snow, still retain the sublime features of alpine scenery; namely, the rugged and bare mountain, the craggy rock, white, gray, red, or brown, springing up in fantastic forms above the general mass; and the deep and suddenly descending chasm, with the foul torrent foaming over its rocky bed. The luxuriant foliage is wanting which embellishes the lower hills; the rich and smiling valley is not so often seen; whilst the forests of dark brown fir fringing the mountains and the hollows impart a sombre and unvarying appearance to the scene. At a lower level the country improves; and though it still exhibits the mountain and the precipice, the intervening valley is clothed with verdure, and the lower hills with the most magnificent forests of large and lofty trees, the open country with roses, jasmines, and other lovely or odoriferous shrubs, and with the most luxuriant alpine plants.[3] The valleys through which flow the head waters of the Indus and the Ganges, namely, the Sutlej, the Pabur, the Jumna, the Baghiruttee, the Alkananda, with their tributaries, exhibit all the varied and sublime scenery of this romantic country. The valley of the Sutlej is hemmed in by brown and barren mountains, steep and rocky, without the grandeur of lofty precipices or fringing wood. The hollows through which it receives its tributary streams are dark chasms, without cultivation; the heights crowned with forts, but without any neat villages surrounded with trees to relieve the adjacent desert. The banks of the Jumna, on the other hand, though rocky and wild, are wooded and green, and the sloping faces of the hills fertile and well cultivated; and even at its source, the country, however wild and picturesque, is still not nearly so dreary as the valley of the Bhagiruttee. The features of the landscape are here lofty, rugged, and inaccessible, with less of the beautiful than of the sublime and terrible. A pleasing contrast to this wild scenery is presented by the smiling valley through which the Pabur meanders, chequered as it is with pasture and crops, and the banks and the hills clothed with cultivation, villages, and wood. Such is the usual aspect of the lower valley of Northern Hindustan, the height of which is for the most part from 3000 to 6000 feet above the plains. The difference between the northern and southern exposures of this mountainous country is remarkable, not only in the formation and structure of the hills and rocks, but in the vegetation. The country on its southern face is of a brown and dusky colour; the grass short and parched; the hills rough and lumpy, with rocks standing through the ground; the lower parts bare of wood; and above, the Weymouth pine, with a few stunted larches sprinkled amongst the rocks; whilst the higher parts are spread over with oak, holly, and alder, their leaves of brownish green, harmonizing with the burned appearance of the hills, and giving a sombre hue to the whole scene. On the northern exposure a rich colour of dark green is diffused over the whole landscape; the rocky sides of the glens are bolder and grander; and they are clothed with noble forests of larch, silver, and spruce firs, which shroud from the view the highest and steepest cliffs. "All," says Fraser, "was rich and dark; and here and there a glade opened, or a high slope extended from the base of the rock, or projected between two streams, of a bright beautiful green, shining through the sombre forest." This difference between the northern and southern exposures is strongly marked all over the hills.[4]

That strip of flat country, about twenty miles in breadth, which lies at the base of the great Himalaya range, dividing it from the plain of the Ganges, is called Terrae or Terreeana. It is covered with thick forests and low swamps, and, though fertile, it is so unhealthy that it is little cultivated. Bishop Heber graphically describes it as a long, black, level line, extending at the foot of the lowest hills; "so black and level," he adds, "that it might seem to have been drawn with ink and a ruler." This flat does not extend farther north-west than through a portion of Rohilcund, where the healthy cultivated country reaches to the foot of the hills, which rise abruptly from the sandy flat beneath. These low hills are watered by streams from the higher mountains, that rise to the level of 1500 or 5000 feet, from which this lower range is frequently separated by fine valleys of some length, which are called *doon* by the natives, answering to the Scottish name of *strath*. The hills which rise beyond this lower range, to the height of about 5000 to 7000 feet, are lofty and majestic, and broken into numerous ridges, divided by deep shaggy dells. This appearance Fraser ascribes to the quality of the rock of which they are composed, which consists of a strongly indurated clay, with a mixture of siliceous matter, forming a rock exceedingly hard, though easily destructible by exposure to the air, and splitting into variously-sized fragments, leaving hard marbly masses staring through the scanty soil. It may be finally remarked of this singular and interesting country, that though it appears from the plains to be divided into distinct ranges of terraces, it is really a vast collection of mountains heaped in masses one above another, without any order or plan that can be discovered, until the height of land is reached at the great Himalaya ridge which extends from beyond the sources of the Indus in a continuous chain far into China.

The great plain of Hindustan presents an entirely different scene. The cold and bracing air of the upper country is there exchanged for burning heat; the mountain torrents no longer rage, except when they are in flood, but roll their streams lazily over the plains. That large tract which is contained between the Indus and the Brahmapootra, and which extends E. and W. from 1200 to 1400 miles, and about 300 to 400 miles from N. to S., is, with few exceptions, a level country, consisting chiefly of the great plain of the Ganges, rich and fertile, and clothed with the most luxuriant vegetation, in which the spreading palm, with groves of mango and other trees of the most luxuriant foliage, and gardens, are intermixed with cultivated fields. The noble river which intersects this extensive plain determines the aspect and character of the country. Its swelling stream, as it approaches the sea in the provinces of Bahar and Bengal, is very broad and deep, and waters so completely the whole country, that in the driest season there is scarcely any part more than twenty miles distant from some river; and by means of lakes, rivulets, and water courses, boats may approach the peasant's door. During the annual inundation, a large tract of cultivated country is submerged to a great depth; and the lower part of the Delta, named the Sunderbunds, is chequered by a labyrinth of creeks and rivers, expanding to a breadth of 200 miles; the actual inundation reaching a breadth of 100 miles, in which trees and villages are seen like islands appearing above the water. Higher up the stream the inundation is diminished in extent; and in the province of Bahar the river is not above a mile broad, the country being flat and fertile, though not so abundant in trees as the rich plains of Bengal. Towards the west, the plain watered by the Ganges and its tributary streams yields in abundance all the productions of the tropics; especially the Dooab, or the tract that lies between the Jumna and the Ganges, the provinces of Allahabad and Agra, and in general all the alluvial tracts near the rivers. At a distance from these, irrigation is resorted to by the cultivators, and deep wells are dug. The plain is diversified by ranges of hills, with abrupt peaks occasionally shooting up, and crowned with forts, in which during the decay of the Mogul empire, the rebellious or robber chiefs sought to secure a precarious independence. The plain of Hindustan is generally fertile when water can be obtained; and, as it approaches the mountains, in the northern provinces of Oude and Delhi, and is watered by the numerous streams flowing towards the Ganges, it is flat, fertile, and rich, except towards the western borders of Delhi, on the verge of the great desert, where sterile tracts occur, without cultivation or inhabitants. Towards the south-western portion of the plain, near the Nerbuddah, in the province of Malwah, the country is of greater elevation, but has a regular descent from the Vindhya Mountains, which extend along the north side of the river, as is pointed out by the course of the numerous streams that still flow northward into the Ganges. But the aspect of the country changes as it recedes from this great stream; the overflowing river no longer spreads over the plain, and forms a navigable water-course; it is now merely a mountain torrent, of no depth, to float down the produce of the country. Westward, in approaching the Indian Ocean, wild tracts occur, hilly and rocky, and overgrown with jungles, the haunts of wild beasts and of robbers; and still further west, the province of Cutch is a cold sterile waste, half covered with a salt morass called the Runn. In the interior of Hindustan, large and fertile tracts have been laid waste by misrule, or the devastations of war: these are overrun with a rank vegetation, which quickly springs up under the quickening influence of a tropical sun; and which, consisting of tall trees with spreading branches, interwoven into an impenetrable fence with brushwood, and with innumerable shrubs and creeping plants clinging round the trees, and lacing them firmly together, forms thick jungles, affording abundant cover to the wild animals of the country, and to gangs of banditti, who are even more ferocious than the beasts of the field.

Hindustan, as well as almost all other tropical countries, would soon be changed by the great heat into deserts of sand, like a large portion of Africa, if it were not refreshed by the periodical rains and the overflow of the rivers. In the plain of Hindustan, towards the west, occurs a tract of this description, which, having neither rains nor refreshing streams, still remains an arid sand. This great desert reaches northward to the Ghara, a river formed by the united streams of the Beas and Sutlej, and south as far as the salt lakes of Cutch, which communicate with the Gulf of Cutch in the Indian Ocean. It extends about 500 miles from N. to S., and is about 400 miles in breadth, encroaching eastward on the cultivated parts of the Delhi and Agra provinces, and westward on the country fertilized by the Indus. Mr Elphinstone, in his journey to Afghanistan, travelled across this waste, which he describes as consisting mostly of hillocks of loose and deep sand, from 20 to 100 feet in height, which in summer are blown aloft in clouds by the wind, and threaten to overwhelm the traveller. Here a miserable village is sometimes seen, which is merely a few round straw huts with low walls and conical roofs, like little stacks of corn, surrounded by hedges of dry thorny branches stuck in the sand. A few fields, watered by the dews and the rains, surround these abodes of misery, and yield crops of the poorest kinds of pulse, and coarse grain. Water is scarce, and is only obtained from wells often 300 feet deep, with a diameter of only three feet, and all lined with masonry. One was seen by Mr Elphinstone of the enormous depth of 345 feet, with such a scanty supply of unwholesome brackish water, that the whole was drawn out, by two bullocks turning the water-wheel, in a single night. In this sandy desert springs up in profusion the most juicy of all fruits, the water-melon. From about the western frontier of Ajmeer, at Shekawutty, to Bahawulpoor, the distance is 280 miles, of which the western portion, for 100 miles, is wholly destitute of inhabitants, water, and vegetation. In the Punjab, the abundance of water corrects the sterility of the soil; and in the country watered by the five well-known rivers which flow into the Indus, cultivation, with waving grass and trees, marks the termination of the desert. In the north-western extremity of Hindustan, high up the Indus, and embosomed amongst lofty mountains, is situated the valley of Cashmere, celebrated in oriental tales for its romantic beauty. Here the eastern princes, in the days of their prosperity, were wont to retire, and to seek in those sequestered scenes of natural beauty, a brief oblivion of their daily cares.

The country to the S. of Nerbuddah, namely, the Deccan, extending N.W. and S.E. 800 miles, comprehends the whole breadth of Hindustan, between the Nerbuddah on the N. and the Krishna or Kistnah River on the S. The western range of the Ghaut Mountains, rising up with the steepness of a wall from the shore of the Indian Ocean, runs along the coast southward from the River Taptee, as far as Cape Comorin, and forms the highest land, only about seventy, or in some places forty miles, from the western shore; whilst on the opposite side of the range, the table-land, elevated about 3000 feet above the sea, has a gradual slope to the eastward for a distance varying from 300 to 700 miles, and owing to this conformation of the ground, all the rivers of any size or length of course, such as the Godavery and the Krishna, which water the Deccan, and the Palar and the Cavery, which belong to Southern India, roll down the eastern declivity of the Ghauts. These mountains also diverge in ridges across the country of the Deccan, which on the eastern coast is low, flat, and sandy, with the exception, however, of the tract between the Godavery and Kistna or Krishna rivers, 150 miles in length, along the sea-shore, and forty miles broad, composed of rich vegetable mould, such as is usually found at the mouths of rivers, and remarkably fertile. In the interior, the country, especially towards the N., is wild, woody, mountainous, and overrun with thick jungle; in some parts, as on the S.W. frontier of Bengal, it is a primeval wilderness, inhabited by people but slightly reclaimed from natural wildness. Throughout Hyderabad and Nagpore the country has a gradual slope eastward as indicated by the course of the two principal rivers, the Godavery and the Kistna, both of which, though issuing from the base of the Western Ghauts, find their way into the Bay of Bengal. Towards the S. of Nagpore, large tracts have been desolated by war and robbery; and ruined towns, and wasted fields overgrown with jungle, still remain the sad memorials of those calamities. The western districts of the presidency of Bombay extend towards the Indian Ocean, and include the Western Ghauts, which rise to the height of about 3000 feet above the level of the sea. They abound in all the interesting aspects of mountain scenery, and are studded with fortresses and natural strongholds. The eastern declivity stretches out into a table-land, with plains well watered and productive; whilst the intervening strip of land, from the mountains to the sea, is in general a rugged district, but improves as it approaches the mountains, which are fringed with noble forests of teak and other valuable trees. Numerous mountain streams, but no rivers of magnitude, make their way westward to the sea from the Ghauts; and there are few coasts so much broken into small bays and harbours with so straight a general outline.

To the S. of the Kistna River, the country forms a triangle, of which this river is the base, and the coasts of Coromandel and Malabar the sides. Its extent from the Kistna to Cape Comorin, which is the point of the triangle, is 600 miles; and its breadth in the widest point is about 550. It may be shortly described as a table-land 3000 feet in height, containing the principal districts under the Madras Presidency, and enclosed on each side by the Western and Eastern Ghauts, from which the country descends on both sides to the sea—on the E. to the Bay of Bengal, and on the W. to the Indian Ocean, forming the two provinces of the Carnatic and of Malabar; the latter a narrow strip of low country, extending 200 miles along the coast, much broken and interspersed with back-water runs and extensive ravines, shaded with forest and jungle, and filled with population; the former also a long narrow tract, stretching 570 miles along the shore, and nowhere more than 120 miles in breadth, and commonly not more than 75. The Eastern Ghauts extend along the coast of Coromandel. They are not so high as the western range; and naked, sun-burnt, and rocky peaks are more commonly seen amongst them. The table-land in the centre descends both towards the N. and S.; its elevation in the southern province of Coimbetore not exceeding 900 feet. It is extremely diversified with woods, waste, and jungles; and cultivation is here, as in other parts of India, carried on by means of large tanks containing a supply of water for the irrigation of the land. In descending from the hills into the southern plains of Travancore, which extend to the Indian Ocean, the country presents a varied prospect of hill and dale, and winding streams which clothe the valleys in perennial green; and the grandeur of the scene is heightened by the lofty forests which cover the mountains, producing pepper, cassia, frankincense, and other aromatic gums.

The following are the chief rivers of Hindustan, with the length of their respective courses to the sea:—Indus, 1700 miles; Brahmapootra, 1900; Ganges, 1500; Jumna (to its junction with the Ganges, 780), 1500; Sutlege (to the Indus 900), 1490; Ghylum (to the Indus, 750), 1250; Gunduck (to the Ganges 450), 980. In the Deccan and S. of India, the Godavery, 850; Kistna, 700; Nerbuddah, 700; Mahanuddy, 550; Tuptee, 460; Cavery, 400. There are few coasts of such extent, so destitute of islands and harbours as that of Hindustan. With the exception of emerged sea banks and mere rocks, Ceylon is the only island near its shores; and on the eastern coast, Masulipatam, which admits vessels of 300 tons burden, is the only harbour for large vessels between Trincomalee in the island of Ceylon, and the Ganges, which is free from a raging surf. To this inconvenience, Madras, though an important British settlement, is peculiarly liable. On the western coast, the only harbours capable of admitting large vessels are Bombay and Kurachee in Scinde; Mangalore admits no vessels drawing more than ten feet.

Climate.

Hindustan comprehends within its bounds the opposite extremes of heat and cold. The plains are burnt up with intense heat; whilst winter, with every intermediate variety of temperature, prevails in the mountains. Philosophers have in vain endeavoured to fix the point of perpetual congelation under different degrees of latitude. They have indeed framed a graduated scale of the respective heights at which, according to calculation, this point should begin at corresponding distances from the equator. But theory is here at variance with actual observation. The climate of mountainous tracts depends so much on localities and the particular course of the winds, as to baffle all general speculation. Hence in the Himalaya Mountains harvests of grain are found, where, according to hypothesis, the ground should be buried under deep snow, and trees are seen to flourish in the regions of perpetual winter. Captain Webb, in ascending the Himalaya range, saw around him, at the height of 11,630 feet above the level of Calcutta, rich forests of oak, pine, and rhododendra, the ground covered with vegetation as high as the knee, strawberry beds in full flower, and currant bushes in blossom; and in 1818, at the Niti Pass, 16,814 feet in height, philosophy was again at fault, as the ground was clear of snow, though above the line of perpetual congelation, and many quadrupeds were feeding on the grassy banks of the Sutlege. It was remarked by Dr Gerard that vegetation attained a higher level on the northern than on the southern face of the Himalaya ridge, where the extreme height of cultivation is 10,000 feet; the limit of the forest 11,800 feet, and 12,000 feet that of bushes. On the northern side cultivation rises to the height of 11,400 feet; in other places to 13,600 feet; birch trees to 14,000 feet; and tama bushes, which form excellent fuel, to the height of about 17,000 feet. In Northern Hindustan, great and sudden changes of temperature occur, which is the cause of pulmonary affections. During summer, the thermometer, which is often in the morning at 32° or under it, rises to 70°, 75°, and 80°, or upwards during the day: the winters are, however, uniformly severe. In this also, as in other hilly countries, the traveller may be fainting to-day under a tropical sun, and shivering to-morrow amidst the rigour of perpetual snows. From the banks of the Sutlege, where the thermometer frequently stands at 100° and 108°, three days climbing will carry him into the regions of winter.

Seasons.

In the plains of Hindustan, the heat during the greater part of the year is unintermitting and intense, except where it is modified by the ranges of mountains, or the table-lands towards the W. The seasons here are commonly divided into the hot, cold, and rainy. The spring and the dry season throughout the valley of the Ganges last about four months, the heat gradually increasing with the season, until, in May and June, the thermometer rises to 100°, and frequently in the interior to 108° and 110°, when it is almost intolerable even to the natives, and still more so to Europeans, who resort to various modes of alleviation, such as the *cuscus tatty*, which is a frame of wood, interwoven with twigs, between which is distributed a layer of a particular kind of sweet-scented grass. This being hung before an open window, in the quarter of the prevailing wind, and constantly moistened on the outside by a water-carrier, diffuses a refreshing coolness. Bishop Heber, however, thought it more effectual to shut out the external air, by which, and by agitating the air within by punkahs, a slight frame of wood, covered with silk or with canvas, and suspended from the ceiling, and swung backwards and forwards by servants, he reduced the temperature to 85° within doors, although it was at 100° without. Thus imprisoned, he complains that in going to an open window or door, "it is literally like approaching the mouth of a blast-furnace." This raging heat is modified by occasional thunderstorms from the N.W., termed north-westers, which, however terrific, refresh the air and the ground, and give new freshness and luxuriance to the grass, and to the shrubs and trees. Milder showers also occur, which refresh the atmosphere. In the western provinces of Allahabad, Agra, Delhi, &c., a parching wind very frequently blows from the W. during the hot season, and, during the night, is succeeded by a cool breeze from the opposite quarter, sometimes for days and weeks by easterly gales; and as these parching winds prevail, refreshing breezes and cooling showers of rain and hail are more rare. Those remarkable winds, the monsoons, which blow half the year from the S.W., and and the other half from the N.E., exercise a powerful influence on the climate and seasons of Hindustan. The periodical rains are ushered in by the S.W. monsoon, which commences about the beginning of June in the S. of India, and somewhat later towards the N. Mr Elphinstone, in his account of his journey to Afghanistan, gives a just and forcible description of the phenomena which accompany the change of the seasons in those eastern countries. "The approach of the monsoon," he observes, "is announced by vast masses of clouds that rise from the Indian Ocean, and advance towards the N.E., gathering and thickening as they approach the land. After some days, the sky assumes a threatening appearance in the evening, and the monsoon in general sets in during the night. It is attended by such a thunderstorm as can scarcely be imagined by those who have only seen that phenomenon in a temperate climate. It generally begins with violent blasts of wind, which are succeeded by floods of rain. For some hours lightning is seen almost without intermission; sometimes it only illuminates the sky, and shows the clouds near the horizon; at others it discovers the distant hills, and again leaves all in darkness, when in an instant it re-appears in vivid and successive flashes, and exhibits the nearest objects in all the brightness of day. During all this time the distant thunder never ceases to roll, and is only silenced by some nearer peal, which bursts on the ear with such a sudden and tremendous crash as can hardly fail to strike the most insensible with awe. At length the thunder ceases, and nothing is heard but the continued pouring of the rain and the rushing of the rising streams. The next day presents a gloomy spectacle; the rain still descends in torrents, and scarcely allows a view of the blackened fields; the rivers are swollen and discoloured, and sweep down along with them the hedges, the huts, and the remains of the cultivation, which was carried on, during the dry season, in their beds." After some days the sky clears, and discloses the face of nature changed as if by enchantment. The fields, formerly parched, are now covered with luxuriant verdure; the clear and burning sky is varied and embellished with clouds; the rivers are full and tranquil; the dust which loaded the atmosphere, and which made the sun appear dull and discoloured, has now disappeared; and the parching wind, like the blast from a furnace, and the still more sultry calms, have been succeeded by a pure and delicious air. Intermitting rains now fall for about a month, when they come on again with great violence, and in July are at their height. During the third month they rather diminish, but are still heavy; and in September, and at the end of the month, they depart amidst thunders and tempests as they came.[1] From 50 to 80 inches of rain fall in Bengal during the rainy season.[2]

The dense masses of clouds which arise on the Indian Ocean are carried forward by the S.W. monsoon over the plains of Hindustan, as far as the Himalaya Mountains. On the coasts they descend in deluges of rain, which diminish as they recede from the sea, unless where the vapours are intercepted by high mountains, when they pour down in torrents of rain on the plains beneath. But in Southern India, the S.W. monsoon is intercepted by the double chain of the Western and Eastern Ghauts, by which the mass of clouds being as it were cut in twain, is carried forward on the N. and S. sides of this mountain wall, going clear of a considerable tract to leeward of the Eastern Ghauts, namely, the coast of Coromandel, which is thus free from the periodical rains which fall in all other places of Hindustan. The western range of the Ghauts, though it checks, does not altogether impede the passage of the clouds; and we find accordingly, that in the table-land of Mysore and the neighbouring countries, the S.W. monsoon brings on the rains, though they are not so violent nor of such long continuance as in Bengal, and on the western shores of India. But those light and elevated clouds which pass the Western Ghauts, being stopped in their progress by the eastern chain, or descending in rain on the intermediate table-land, never reach the Coromandel coast; and here, accordingly, on the eastern side of the mountains, the dry season prevails, when it rains on the table-land of Mysore to the W., and still more heavily on the Malabar shore. On the other hand, it is the N.E. monsoon which, in the Bay of Bengal, sets in about the middle of October, with thunder and lightning and violent hurricanes, that ushers in the rains on the Coromandel coast, which continue to the middle of December, and sometimes to the 1st of January, whilst at this period southerly gales and fair weather prevail on the opposite coast of the Indian peninsula. It was formerly supposed that the Ghauts, interrupting the progress of the S.W. monsoon, occasioned a diversity of seasons throughout a great part of India. But it is only that limited tract of country to the leeward of the Eastern Ghauts that is free from the influence of the S.W. monsoon, which accordingly brings on the rainy season at the mouth of the Godavery, immediately to the N. Major Rennell suggests that those clouds may be blown by the S.W. monsoon from Cape Comorin; though he afterwards adds that this is not his opinion, because the cape bears S.S.W. from the mouth of the Godavery, and the reigning winds are much more westerly.[3] But the true reason seems to be, that the eastern chain of the Ghauts does not extend so far N.; hence they afford no shelter to the country at the mouth of the Godavery, which thus lies in the direct course of the S.W. monsoon. To the N. of the Ghaut Mountains, in the parallel of Surat, the S.W. monsoon, meeting with no interruption, carries its supplies of moisture over the whole face of the country. The periodical rains accordingly extend over the great plain of the Ganges. They commence on the coast of Malabar in May, farther N. in June, where they are not so violent; at Delhi they do not come on till the end of June; and a much smaller quantity of rain falls than at Bombay or Calcutta[4]. Near the sea the clouds are still in a deep mass, and descend in deluges of rain; but they are exhausted as they go; the rains become weaker and weaker; and are at last diminished to a few transient showers in the S. of the Punjab. On the sea-shore the S.W. monsoon extends into Beloochistan, and thence into Mekran, the easternmost province of Persia, where the clouds being arrested by mountains, descend in heavy rains. They pass with little obstruction over the countries of Lower Sind; but being intercepted by the mountains of Upper Sind, they occasion the principal rains of the year.

The eastern provinces of Hindustan, including Bengal and the mountainous countries of Bootan, Nepaul, and the other contiguous provinces, are not dependent on the rains that come across the country from the Indian Ocean, which would be very scanty at so great a distance from the sea. Of the mass of clouds driven before the S.W. monsoon, that portion which passes Cape Comorin on the S. is carried north-eastward across the Bay of Bengal, until, meeting with the mountains that join the Himalaya from the S., of which they are indeed a continuation, they follow their direction, and are thus diverted from a north-easterly into a north-westerly course; and it is from this quarter accordingly, that the north-eastern districts of Bengal and the adjoining provinces receive the rains fresh and abundant from the ocean. Part of these clouds make their way over the first hills, and bring on the rains in Nepaul and Thibet; and part passing to the N.W., water the plains of Bengal, the southern face of the Himalaya Mountains, the countries which lie to the N. of the Ganges, the northern parts of the Punjab, and, in their progress to the N.W., the southern declivity of the Cashmere Hills, and the plains beneath, though they scarcely make their way over these hills into the Valley of Cashmere. They continue their progress westward to Afghanistan, where they gradually become weaker, and only produce occasional showers. The cold season, which succeeds the rains, lasts from November to the middle of February; and during all this period the air is clear, and the thermometer is from 65° to 84°. In Southern India the heat is greater than in Bengal. In the Carnatic the thermometer ranges from 100° to 106°, and the cold season is of very short duration. On the table-land above the Ghaut Mountains, as at Coimbetore, among the hills, the temperature in the cold season is from 31° to 59°; in summer 64°, 65°, and 75°, or even higher. On the table-land in which Bangalore is situated, the thermometer seldom rises above 82°, or falls below 56°.

Vegetable produce.

Hindustan comprehends all the known varieties of the vegetable tribes. The mountainous tracts of Northern Hindustan produce all the alpine plants, and the various species of European grain, fruits, and flowers. Deep woods cover those lower ranges of mountains, in which are found the pine tree of various species, " the tallest, straightest, and most magnificent," says Fraser,[1] he ever beheld; the larch, the silver, and the spruce fir, from the bark and twigs of which resin exudes in abundance; the yew tree; several species of oak, holly, alder, sycamore, birch, with mulberry and chestnut trees. Here is also found the mimosa tree, from which is made the catechu or Indian rubber;—the resinous part of this fir, cut into slips, answers the common uses of the lamp. These noble forests extend over immense tracts, and would afford inexhaustible supplies of timber, if they could be transported to the proper market. Fruits in great variety are also produced in this elevated region, such as apricots, peaches, and grapes, apples, pears, currants, raspberries, blackberries, and strawberries; roots, such as turnips, carrots, garlic, onions; flowers and plants, as roses, both red and white, lilies of the valley, jasmines, buttercups, yellow, blue, and white cowslips, sweet briar, with numerous other beautiful and fragrant plants. The valleys exhibit, according to their altitude and temperature, the productions of Europe or of the tropical countries. At the height of 6000 feet appear the oak and the pine; at that of 3000 feet rattans and bamboos of enormous dimensions; in some parts the pine-apple, the orange, the sugar-cane, grow to maturity; in others, barley, millet, and similar grains are produced. The lower part of these hills is the seat of the saul forests. The lower valleys yield rice sown broad-cast, maize, wheat, barley, pulse of various kinds, sugar-cane, cotton, Indian madder, a large species of cardamum, besides other productions. The pastoral tribes of Northern Hindustan feed considerable flocks on the lower hills and valleys; in summer they climb the alpine country, and browse on the herbage adjacent to the region of perpetual frost.

The vegetable produce of the plains in Hindustan, and of the southern provinces, is the same as in all tropical countries. The soil, where it is copiously watered, is fertile; and if the country were one unvaried level, the copious rains would afford a sufficient supply for every spot. But, from the inequalities of the surface, the lower parts are frequently overflowed, whilst, in the higher grounds, vegetation is burnt up. To secure a more equal distribution of water, various contrivances are resorted to. It is retained in extensive plains by means of dams, or in reservoirs constructed of stone, or in ponds and water-courses, whence it is distributed over the land. Some of these works, though erected at great cost, are in a dilapidated state. Their construction conferring a reputation for piety, they have been uselessly multiplied; and not being duly repaired, they are soon filled with aquatic plants, putrid water, bad smells, and pernicious exhalations. One of these tanks, seen by Dr Buchanan, is stated to be 8 miles long and 3 broad. " I never viewed a public work," he observes, " with more satisfaction, a work which supplies a great body of people with every comfort which their moral situation will permit them to enjoy."[2] The Hindu, though he is a most industrious, is not a skilful cultivator; his implements are of a very rude kind; and even if he had the skill, he has not the capital necessary for an improved system of husbandry. The ploughing in Hindustan is quite different from any thing seen in this country. The plough has no contrivance for turning up the earth, nor has the share sufficient depth to stir a new soil. Several ploughs in succession deepen the furrows, or rather scratch the surface. The branch of a tree, or some other equally rude substitute for a harrow, is then employed to pulverise the soil, and prepare it for the seed. The plough is drawn by oxen, and in Southern India by buffaloes. The field, after it is sown, must be protected for several days by a person exalted on a bamboo stage, against the depredations of numerous flocks of birds, and still longer in woody districts, from the havoc of wild elephants, buffaloes, and other animals. The harvest is reaped by the sickle, the scythe being unknown. There is no occasion for stacking rice, which is completely preserved by the husk. The grain, after it is winnowed, is stored in jars of unbaked earth, or in baskets made of large twigs. In Benares and the western provinces, and also in the S. of India, it is stored in subterraneous granaries; but in the damp climate of Bengal it is hoarded above ground. The rotation of crops, so essential to the husbandry of Europe, is not known in Bengal; nor are the articles for cultivation ever selected with any view to restore the exhausted powers of the soil. The land is never properly manured. The Hindus, from their limited use of animal food, are no extensive breeders of stock. The labouring cattle are either pastured on small commons, or fed at home on cut grass;

and those for the dairy graze in numerous herds in the forests or on the downs. The dung is accounted holy by the superstitious Hindus, and is either converted to religious uses, or into fuel, and sold. In Bengal no manure is used; and, in the southern provinces, only a small quantity of ashes and dried vegetables. Oil-cake is sometimes employed as a manure for the sugar-cane. The public revenue is derived chiefly from the land, but the government are no longer the sole landlords; their interest in the soil has been defined by the limitation of the public demand, and new classes of landed proprieters are springing up in all parts of the empire.

Rice is the great staple of agriculture throughout Hindustan, in the plain of the Ganges as well as in Southern India. It is sown at the approach of the rains, and it is gathered during the rainy season, about the end of August; the last crop is sown during the same season, and is gathered in the beginning of December. It is esteemed the best, not being equally liable with the other to decay. The diversity of soil and climate, and the several seasons of cultivation, have given rise to infinite varieties in this species of grain. When the rains fail throughout Hindustan, which occasionally happens, the rice crops are apt to be deficient to a degree altogether unknown in the well-regulated agriculture of Europe, where the severest scarcity hardly ever raises the price of corn more than three times its usual rate. But the famines of Hindustan leave thousands without subsistence, and fill the land with scenes of misery and death. In the great famine of 1769, it was estimated that three millions of the people perished; the air was so infected by the noxious effluvia of dead bodies, that it was scarcely possible to stir abroad without perceiving it, and without hearing also the frantic cries of the victims of famine, who were seen in every stage of suffering and death; whole families expired, and villages were desolated; and when the new crop came forward in August, it had no owners. Bengal has been less liable to famines since this period, but they have frequently occurred in other parts of India. Rice thrives well in the inundated track of the Ganges, and in Southern Hindustan, especially on the low lands of the sea-coast; higher up the Ganges, wheat and barley are more generally cultivated, also in the high grounds and elevated table-lands of Southern India. Other kinds of grain are cultivated, such as Indian corn; and great varieties of pulse and coarse grains, such as peas, beans, chiches, gram, vetches, and raggy, which is the most important crop raised in the dry field, and in some parts of Southern India is the subsistence of all classes, in others of the poorer classes. These are important articles of cultivation, as they have each their particular season, and thrive even on poor soils. Maize is the general produce of poor soils in hilly countries, and is commonly cultivated in the more western provinces. Millet and other grains are also cultivated, and, vegetating rapidly, and in every season, they fill up profitably for the farmer the short intervals between the other modes of cultivation in Lower Hindustan. Sugar is everywhere cultivated, and at little expense, by the Hindu cultivator; and as the sugar of India is no longer subjected in the United Kingdom to an unequal import duty, there is reason to hope that the produce of India may compete not only with the sugars of British colonies, but with those also of Cuba, Brazil, Siam, and Manilla. Though formerly unknown in Europe, sugar has been produced in India from the remotest times, and was thence transplanted into Arabia, whence it has been introduced into Europe, Africa, the West Indies, and America. It grows luxuriantly throughout all the valley of the Ganges and in the plains of Southern India, and could be produced, with the help of European skill and capital, to meet any demand. It thrives more especially in Bahar and Benares, and in particular districts of Bengal. Opium is the peculiar and staple produce of the province of Bahar, and is also extensively cultivated in Malwah, and in other parts of Hindustan. It is a precarious crop, producing alternately high profits and heavy losses. The liquor extracted from the poppy is collected as it exudes, and is then placed in pots, where it is dried and formed into lumps, in which process it loses from one-tenth to one-eighth of its weight. The opium produced in Bahar and Bengal being monopolized by the East India Company, and bought at a fixed price, is a contraband article of trade, and its cultivation is confined to certain districts. Within Bengal no one is allowed to cultivate the poppy except for the government. In Malwah a treaty was entered into with the different rulers and chiefs, by which the monopoly was extended to that country, and all that was produced delivered to the Company, at the rate of three rupees a seer, which is two pounds. But so great was the discontent excited by this extension of the monopoly, that, at the desire of the chiefs, the treaties were rescinded in 1819–1820; and the trade in opium, and its cultivation, is now free in that province, and everywhere throughout India, except in the Company's dominions; but as Malwah is completely surrounded by British territory, a large revenue is derived from the high duty levied on Malwah opium in transit to Bombay for exportation to China. Malwah opium equals that of Bengal, and is brought into competition with the Company's opium in all the foreign markets, and especially in China.[1] The cotton plant has from time immemorial been one of the staple products of Hindustan, and is indigenous from Ceylon in the S., to the Himalaya Mountains. It is cultivated extensively throughout Bengal, and in the interior provinces on the banks of the Jumna; also in the Deccan, and in Southern India, whence it is imported into Bengal, and into Mirzapoor, and the district of Benares, where it is manufactured. Flax and hemp are also cultivated in several districts both in the N. and in the S. of India. Silk was long the exclusive product of India and China. Silk-worms are now reared principally in the district of Burdwan, and in the vicinity of the Bhagirati and the Ganges, and for about 100 miles down their streams. Four crops of mulberry leaves are obtained in the year, the last in December. A considerable quantity of silk, of a coarse kind, is obtained from wild silk-worms, which do not feed on the mulberry, and are found in the forests of Silhet, Assam, and the Deccan. Indigo was originally a product of India; and the plant was afterwards carried to South America, whence Europe was for a long time supplied with this dye. The manufacture on which the quality of the indigo depends was very unskilfully conducted until the year 1783. Since this period it has been so much improved by the skill and capital of Europeans that it is now a staple article of commerce; and in Bengal the value of the produce in 1854 amounted to L.1,701,206. Indigo is produced generally throughout the plain of the Ganges, and in Southern India, but chiefly in Bengal. Tobacco, formerly unknown in India, and introduced from America probably about the beginning of the seventeenth century, is now extensively cultivated in every part, chiefly however in the northern provinces, and more rarely in the S. The tobacco grown in the Mahratta territories is most esteemed; particularly that which is produced near Bilsea, a town in Malwah. Bengal does not yield good tobacco; but the Company's territories in Guzerat, being principally of a rich black soil, are considered as peculiarly suitable to its cultivation.[1] The Hindus having been already in the habit of inhaling the smoke of hemp leaves, and other intoxicating drugs, readily adopted tobacco as a more agreeable substitute, and it soon came into general use. Their recent knowledge of it appears from their having no name for it which is not a corruption of some European term. Pepper, though of inferior consequence, is a valuable product of Southern India, especially of Malabar. It is produced from a species of vine which is made to twine round the jack tree. It bears fruit about the third or fourth year, amounting to from three to seven pounds weight, and yields two crops in the year. The areca-nut and betel-leaf, universally chewed by the natives, thrive in the low grounds, where water is abundant; and cardamoms, a spice in great repute. The universal and vast consumption of vegetable oils in Hindustan, for food or unguents, or for the lamp, is supplied by the extensive cultivation of mustard seed, linseed, sesamum, palma christi, besides what is procured from the cocoa nut. The first ripen in the cold season, the sesamum during the rains, or soon afterwards.

[1] See *Appendix to the Report on the East India Company's affairs*, p. 15, par. 59, House of Commons Papers, 1831. Minutes of Evidence before Lords' Committee, 26th February 1830.

The forests in the low plains of Hindustan, of Southern India, and those which cover the western range of the Ghauts, and more sparingly the Eastern Ghauts, abound in the most valuable trees, applicable to many important uses. The extensive woods in Southern India supply the teak tree, valuable for ship-building; and in Malabar, extensive tracts of waste land have within the last few years been converted into teak plantations by the government. Saul, sissoo, toon, and bamboo trees abound; the last of which yields a medicine much used by the native doctors, and which sells for its weight in silver. There are many species of the palm tree, with its luxuriant and spreading leaves, of which the produce is extremely useful. The cocoa-nut tree is in some provinces an important article of culture. The kernel is used for food by the richer natives, either in its raw state, or dressed after various fashions; and it yields by far the finest oil in India, if the nut be fresh and the oil quickly used. Extensive tracts, many miles in length, are planted with the cocoa-nut and betel-nut palms. Many other species of timber are found in the deep recesses of the woods, of which Dr Buchanan, in his account of Mysore, gives a particular description, with the botanical names of the different trees, and to his work we refer; observing generally, that the woods consist of every description of timber, black, heavy, and strong, and adapted for the beams and posts of houses; other kinds are white, hard, and durable, and adapted to all the purposes for which strong materials are required; some are beautifully grained, and take a fine polish, and are well suited for furniture, or exude resins and gums of a sweet scent, that are used in temples for incense; the wood of some kindles readily into a clear light, and is used for torches.[2] Other kinds of wood are employed for dyeing. The sandal-wood is valuable for its perfume, and for the essential oil which it yields. It requires a strong soil, and it is twelve years before it attains the proper size for being cut. The billets of wood are prepared by being buried in the dry ground for two months, when the ants eat up all the outer wood, leaving the heart, which is the sandal. The deeper the colour the higher the perfume. The best sandal wood of Hindustan is now in possession of the rajah of Mysore, who succeeded to a small portion of Tippoo's dominions.

The climate of Hindustan, owing to the long and heavy rains of summer, is not so favourable for many kinds of fruit which are not ripened by the previous heat of the spring. Orchards of mango trees diversify the plains of Bengal, and are common all over Hindustan; the palmyra and the date tree abound everywhere, and especially in Bahar. The former thrives remarkably well in dry barren spots, and is prized for the tari or wine which it yields. The bassia, which yields an intoxicating spirit, also suits the poorest soils, and abounds in the hilly districts, where the oil expressed from its seeds is a common substitute for butter. The other fruits are the plantain, the lime, the sweet and bitter orange, the guava, the pomegranate, the jack, the tamarind, &c. Under the shade of lofty flower and fruit-bearing trees, and the luxuriant bamboo, and the rank weeds which shoot up along with them, the natives, from shyness, bury their cottages, and especially their females, from the view of strangers; and the damp vapour from the confined air, the loathsome and pernicious animals which harbour among the trees and weeds, and the filthy habits of the natives, are generally sufficient to repel Europeans from their habitations. The Hindus cultivate in their kitchen gardens a variety of esculent vegetables and roots. But, of the European vegetables, the potato alone is suited to the climate, and is of as good quality as that which is produced in England. Asparagus, cauliflower, radish, onions, and other esculent plants, are raised; but they are comparatively tasteless.[3]

Animals.

Hindustan, from the great extent and inequality of its surface, its stupendous and snow-clad mountains, and its vast and wooded plains lying under a burning sun, comprehends all the most interesting forms of animal life; more especially those animals of the tropical regions remarkable for ferocity or size, which have been the subjects of scientific research as well as of popular curiosity in all ages, and which find ample cover in the deep woods and jungle-covered wastes of those tracts of the country which have been desolated by tyranny or war. A minute or systematic inquiry into so important a branch of natural history cannot within our limits be attempted. All that we can propose is a brief and popular sketch of the principal animals which give to the zoology of India its distinct and brilliant character. The elephant, which holds a conspicuous place in the animal creation, is seen in all parts of Hindustan, and ranges wild in its deep forests and jungles. This animal, from its size and strength, was employed in the ancient wars, and the prodigious momentum of its charge often turned the tide of battle. The richly caparisoned elephant is still used to swell the gorgeous parade of the Asiatic courts, and is at the same time, from its patience and docility, the humblest of domestic drudges. An elephant is about thirty-five inches high when newly born, and does not attain his full growth of ten or ten and a half feet, or twelve feet when the head is set up, until the age of twenty or thirty years. In length he is about fifteen or sixteen feet. The rhinoceros is between five and six feet high, in length eight feet, the whole body covered with a thick and nearly bare skin, in irregular folds, and the head, at least of the Indian species, armed with a single horn. The rhinoceros is strong and active, of peaceable habits; but when he is hunted he turns on his pursuers and resists fiercely. The Bactrian camel with two humps, so useful in traversing the sandy wastes of the torrid zone, and the dromedary with a single hump, formed more lightly for speed, are natives of Hindustan. The deer is found in all its varieties, from the large and powerful mountain stag, with its well-compacted form, to those lighter forms of the antelope species which sport so gracefully in the woods and in the burning plains. The musk-deer, so named from the perfume contained in a small bag situated in the lower region of the abdomen of the male, is a solitary dweller in the mountain tracts of Hindustan and of Central Asia, amidst ice and snows; it is shy and timid, and seldom approaches the lower region of the pine forests. This animal has no horns; the horned tribe are, however, numerous. The Nepaul stag has a short tail, short horns, and two small antlers at the base. Deer of a large size abound in Bengal, and also in Southern India, in the forests of the Ghaut Mountains. One species, with branching horns, attains to the size of a horse. The black deer of Bengal is about fifteen or sixteen hands high; it is a bold, fierce, and powerful animal; dark brown in the upper parts of the body, and in winter of a shining black; whitish in the belly, with a ring of white round the nostrils and mouth. The spotted deer, with large antlers, ranges all over India, and abounds in the forests of Bengal, and along the banks of the Ganges. The hog-deer is known in Bengal and in the northern parts of India; and the roe-buck in the hilly districts, and still more among the Ghaut Mountains in the S. There are, besides, numerous other varieties of the deer species. Hindustan contains several species of the antelope; one about twenty inches in height, and nearly three feet in length, with four horns, haunts the western forests and hilly tracts in the valley of the Ganges. The white antelope, between three and four feet in height, and of surpassing swiftness, ranges along the banks of the Ganges and the Indus, and over the intervening deserts; and another species, with one horn, and an abundant covering of wool, is a native of the mountain and icy regions of the Himalaya. Of the feline tribe, the lion claims the first place. He is considered as the lord of the brute creation; and his whole appearance, the flowing and shaggy mane, the ample forehead, the kindling eye, and the muscular strength and compactness of the whole frame, so powerfully armed by nature for the purposes of destruction, concur to give an idea of majesty and power, which is further strengthened by the boldness and courage with which, instead of seeking a dastardly retreat in the forest or the jungle, he rushes forth to confront his enemies in the open plain, where he is generally shot by the hunters. But, in the event of his being only wounded, he is extremely formidable, from his vast strength and fierceness, and the immense weight of his body, especially towards the head, and the power of his tremendous claws.[1] The lion is not nearly so common in Asia as in Africa, and is only found in the northern provinces of Hindustan.[2] The tiger is the more common animal of India, abounding in all the forests and jungles, from the mouth of the Ganges to the Himalaya Mountains. He is not quite equal in strength to the lion, though superior in activity; and his undulating movements have more of ease, grace, and bounding elasticity; whilst his bright-yellow, tawny-coloured skin, variegated with dark stripes, shaded with white in the under parts, completes this beautiful specimen of the animal creation. Since the British have acquired possession of India, they have so eagerly pursued the sport of tiger-hunting, that the animal has been driven from the inhabited parts of the country into the vast jungles which line the great rivers, and which may be considered as the game preserves of Hindustan. The leopard and the panther are found in the woods; the former animal in such numbers, that during the marches of the British troops in 1803, amongst the deep forests at Cuttack, in the province of Orissa, many of the sentinels were carried off by them in the night. The bear abounds in all the wooded mountains; also wolves, which at Cawnpore, where there is a cantonment, were formerly so numerous that they frequently dashed into some corner of the camp, and carried off children under five years of age, who happened to be straggling amongst the huts. The other wild animals are hyenas, jackals, foxes, hares, porcupines, hedgehogs, monkeys in great variety, and prodigiously multiplied by the superstitious Hindus, who consider them as sacred animals, to the great annoyance of Europeans. The wild boar, which inhabits the woods and jungles of India, is a fierce animal, and very destructive to the corn fields and sugar plantations. It affords excellent though sometimes dangerous sport to the hunter, when it turns on its pursuers. The wild dog of the Himalaya Mountains is a remarkable animal, in form and fur resembling a fox, though stronger and larger. Bishop Heber saw one of these animals which had been taken, and was exceedingly wild and fierce. They hunt in packs, give tongue like dogs, and have a very fine scent; and they are said to attack and, by dint of numbers, to destroy the tiger. They are highly valued in these countries.[3] Dr Gerard observed a pack of these wild dogs stealing along a gulley quite red. The buffalo, both wild and tame, is a native of India. There are different species, one of which (the *Bos Arnee*) is noted for its gigantic dimensions, its great strength, and its horns, which are nearly six feet in length, by the aid of which it is a match for, and frequently repels the fiercest tiger. Dr Buchanan, however, insists that this is merely the common buffalo in its wild state.[4] The yak, or ox of Tartary, particularly described by Turner in his account of his embassy to Thibet, is numerous among the Himalaya Mountains, where they browse in herds, amidst ice and snow; and constitute, next to corn, the wealth of the inhabitants.[5] It has a downcast, heavy look, and is fierce and of a suspicious temper. The Cashmere goat has been long celebrated for the soft silky nature of the wool found at the root of its long hair, which is manufactured into shawls. The other animals in the alpine regions of Hindustan are also provided with a similar covering of soft wool. "The cow," says Moorcroft in his Journal, "has a material of the same kind, not much inferior in warmth and softness; the hare has her fur of peculiar length and thickness; and even the dog has a coat of fur added to his usual covering of hair."[6] The goat bred in Southern India, called the maycay or long-legged goat, mentioned by Dr Buchanan, is also of quite a different breed from the common goat. There are other breeds remarkable for long and curiously-twisted horns. The native horse of India is a small, ill-shaped, vicious pony, the finest horses being imported from the countries to the W. of Hindustan. But wild horses are seen in herds in the northern mountains. The sandy desert in the W. of Hindustan is the haunt of the wild ass; as he is described in Scripture, "his house the wilderness, and the barren land his dwelling." This animal is found in herds of 60 or 70 on the banks of the Runn, the great salt morass or lake of Cutch, where it browses on the brackish and stunted vegetation of the desert. When caught, as it sometimes is by the natives in pits, it is fierce, untameable, and bites and kicks in the most ferocious manner. Its form is that of the mule rather than of the ass; its body is of an ash colour, changing to a dirty white under the belly. It is larger than the tame ass, stronger and more active, remarkable for shyness, and still more for speed; throwing out, at a shuffling trot peculiar to itself, the fleetest horses in the pursuit.[1] In Southern India, the ass, of which there are several varieties as to colour, is very commonly tamed for domestic purposes; some are of a black hue; and there is a species of milk-white ass, though it is rare.[2] The rat tribe abound in Hindustan; and one species is of enormous size, the tail above a foot long, and very mischievous, burrowing to a great depth in the ground, making its way under the foundations of stores and granaries, and perforating the mud or unburnt brick walls of the native cottages.

[2] "The lion," says Bishop Heber, "which was long supposed to be unknown in India, is now ascertained to exist in considerable numbers in the districts of Saharunpoor and Loodianah. Lions have also been killed on this side of the Ganges, in the northern parts of Rohilcund, in the neighbourhood of Moradabad and Rampoor, as large, it is said, as the average of those in the neighbourhood of the Cape of Good Hope. Both lions, where they are found, and tigers, are very troublesome to the people of the villages near the forest, who, having no elephants, have no very effectual means of attacking them with safety. The peasantry here (in the province of Delhi) are not a people to allow themselves to be devoured without resistance, like the Bengalese; and it often happens, that when a tiger has established himself near a village, the whole population turn out, with their matchlocks, swords, and shields, to attack him. Fighting on foot, and compelled to drive him from his covert by entering and beating the jungle, one or two generally lose their lives; but the tiger seldom escapes." Heber mentions, that he derived his information from Mr Boulderson, who was a keen sportsman, and had long been in India, and who said that he had seen some skins of tigers which bore the strongest marks of having been fought with, if the expression may be used, hand to hand, and were in fact slashed all over with cuts of the tulwar or short scimitar." Birds.

The ornithology of India, though it is not considered as so rich in specimens of gorgeous and variegated plumage as that of other tropical regions, still contains many splendid and curious varieties of the feathered race, as well of those that are clothed in nature's gayest attire, far surpassing the richest dyes of art, as of that other class, the birds of prey, distinguished by strength, size, and fierceness. The parrot tribe are the most remarkable for beauty. So various are the species, that we cannot even enumerate them, and must refer for details to the scientific works on the subject. Of the birds of prey, the eagle or the condor, which haunts the inaccessible crags of the great Himalaya range, is the most remarkable. Bishop Heber mentions that one of these animals was shot at Dega by Lieutenant Fisher, with whom he conversed; and, from the bareness of its neck, resembling that of the vulture, the form of its beak, which is longer and less hooked than the eagle's, and from its extraordinary size, he judged it to be the condor. It measured between the extended wings thirteen feet; its talons were eight inches in length; its colour was a deep black. According to Heber, children are sometimes carried away by this animal from the streets of Almorah.[3] Eagles, of which there are three different sizes, are numerous, and do great injury to the flocks of the shepherds in the mountainous districts. There are various kinds of vultures, and also of the falcon tribe. There is the gentle falcon; the goshawk, a large grey short-winged bird; the shaukeen, which is taught to soar over the falconer's head, and strike the quarry as it rises; the chirk, which strikes the antelope, fastening on its head, and retarding its course till the hounds come up; with various other species.[4] Numerous other birds are common in India, such as herons, cranes; the gigantic stork, well known for clearing the country of snakes and other reptiles, and the populous cities of offal; the peacock, which is found wild in the forests in all its various and brilliant hues; the black-backed goose, measuring nearly three feet in length; besides other kinds, which migrate with the seasons, and are very destructive to the corn; swans, partridges, quails, gulls, plovers, wild ducks, and the other common domestic fowls.

Reptiles.

The serpent brood in India is numerous; they swarm in all the gardens, and intrude into the dwellings of the inhabitants. Some are comparatively harmless, but the bite of others is speedily fatal. The cobra di capello, the name given to it by the Portuguese, from the appearance of a hood which it produces from the expanded skin about the neck, is the most dreaded. It is not above three or four feet long, and about an inch and a quarter thick, with a small head, covered on the forepart with large smooth scales; it is of a pale-brown colour above, and the belly is of a bluish white tinged with pale brown or yellow. It is more frequently the assailant than any other, though the bite of these also is equally dangerous, and often fatal. The Russelian snake, about four feet in length, is of a pale-yellowish brown, beautifully variegated with large oval spots of deep brown, with a white edging. Its bite is extremely fatal. The whip snake is a remarkably malignant species; it darts from the thick foliage of the trees at the cattle below, most commonly at their eyes, and inflicts wounds of which they quickly expire, often in great pain. Itinerant showmen carry about these serpents, and cause them to assume a dancing motion for the amusement of the spectators. They also give out that they render them harmless by the use of charms, though it is known that it is by extracting the venomous fangs. But, judging from the frequent accidents which occur, they often dispense with this precaution. The snake-catching fakirs pretend to bear a charmed life; and it is related that one of these impostors being invited by a shopkeeper to catch a snake which had been seen in an inner apartment, was stung in the hip bone, and for shame would not discover the injury he had received, and went home endeavouring to counteract the poison, but in vain. He died; and such is the blind confidence of the natives in these impostors, that they believed he would revive into life, until the body became putrid.[5] Physicians differ respecting the mode in which the poison of serpents acts upon the human frame. The symptoms also vary; the patient being sometimes seized with torpor and insensibility, or falling into feverish heat and convulsions; the breathing laborious; the skin cold and clammy, with a livid countenance and a feeble pulse. The mode of treatment by the British physicians in India is to bind up the limb above the wound; along with this to apply strong stimulants, as ammonia, hartshorn, eau de luce, and the like; and, above all, to give the strongest narcotics, such as laudanum and brandy. By this judicious treatment many patients have been brought back from the jaws of death.[6] There are several water-snakes in India, the bite of which is venomous; and scorpions are common.

Fishes.

The rivers of Hindustan and the surrounding seas abound in a great variety of fishes and amphibious animals, such as alligators, porpoises, and small turtle of inferior quality. The voracious shark infests the mouths of the rivers, as well as the sea-coast, and grows to an enormous size. One that was caught in the Ganges measured in length 11 feet 9 inches, and its girth round the shoulders was immense.[7] The dolphin of the Ganges is about seven feet long, and abounds chiefly in the delta of the river. It pursues its prey with great velocity, though at other times its motions are slow and heavy. The Ganges and its numerous branches, and all the tanks, swarm with fish. During the wet months they may be scooped up with a hand-net in every field; and, next to rice and plantains, they form the main food of the poorest classes. The bickty or cockup is an excellent fish; as is also the sable fish, which is uncommonly rich. But the best and highest-flavoured fish is the mango, a favourite delicacy at all the European tables, especially during the two months when it is in roe. Mullet abound in all the rivers, and are often killed with small shot as they swim against the stream. The Indian eel—of a pale brown colour, with spots of a somewhat deeper hue—is said to possess a certain degree of electrical power. The remora, about seven feet in length, is remarkable for its singular habits. It is used by the fishermen for catching turtle. A long cord being inserted through a ring fastened to the tail of the fish, it is carried to sea in a vessel filled with salt water, and is let out into the water near the turtle, when it immediately fastens itself on its breast so firmly that both are drawn out together. There are many other kinds of fish, some of a delicate flavour, others noted for the various colours of their shining scales. The voracious dolphin, and the flying fish, its food, abound in the Indian seas. The pomfret is much esteemed as a delicacy; also the robal, and several others of the same nature. The bumbalo, when dried, is an article of commerce, and is much prized for its nutritious qualities; as is also another fish, the urahl, found in the interior lakes. There are many other kinds of fish which we cannot attempt even to enumerate. The natives are dexterous fishers. They inclose the fish with nets into a narrow space, when they catch them with their hands or teeth. Bishop Heber, in his excellent Journal, gives a lively account of the fishing of a pool or lake which was nearly dried up owing to the want of rain. The fish were driven into a shallow part of the lake, when four Bheels from the mountains, with bows and arrows, made in a few hours such havoc among them, that they were procured in the greatest abundance. "They singled out the largest," says Bishop Heber, "and struck them with as much certainty as if they had been sheep in a fold. The arrows intended for striking the fish were so contrived that the iron head slipped off the shaft when the fish was struck, but remained connected with it by a long line like a harpoon, and afloat on the water, which not only contributed to weary out the animal, but to show which way he fled, and to facilitate his capture."[1] Oysters are procured from the coast of Chittagong, not so large, but fully as well flavoured, as those of Europe.

Insects.

The insect tribes in India may be truly said to be innumerable; nor has anything like a complete classification been given of them in the most scientific treatises. The heat and the rains give incredible activity to innumerable noxious or troublesome insects, and to others of a more showy class, whose large wings surpass in brilliancy the most splendid colours of art. Stinging musquitoes are innumerable; and moths and ants of the most destructive kind, as well as others still more noxious and disagreeable. Amongst those which are useful is the silk-worm; the insect which produces the vermilion dye, the cochineal, a South American species; and that which produces lac, which is imported into Europe and used for varnish, and more recently for cochineal. Clouds of locusts are occasionally seen, which leave no trace of green behind them, and give the country over which they pass the appearance of a desert. Dr Buchanan saw a mass of these insects in his journey from Madras to the Mysore territory, about three miles in length, like a long narrow red cloud near the horizon, and making a noise somewhat resembling that of a cataract. Their size was about that of a man's finger, and their colour reddish. They did no damage at that time to the smallest vegetable, but at other times they eat up every green thing.

Mineral productions, &c.

From the wild and inaccessible nature of the country in many parts of Hindustan, its metallic products are but imperfectly known. It is found to produce all the metallic ores, as well as diamonds and precious stones, and other mineral substances. Gold is generally found in the sands of the mountain streams, and is extracted by washing. The head streams of the Ganges bring along with them particles of gold, which in Rohilcund are collected by a particular caste of people. It is found in various parts of Mysore, particularly 9 miles E. of Boodicotta, where the country is impregnated with it; also in the Nielgherry Mountains; and in great quantities in all that tract of country that lies west; and in the adjoining Koondanad and Ghaut Mountains. This whole tract, including the mountains, and comprising a space of 2000 miles, contains gold. Unrefined gold is regularly exchanged by many of the mountain tribes of the north for the produce of the plains. It is estimated that about 1000 men are continually employed in collecting this precious metal. Copper is produced in the province of Delhi, which the natives collect either on the surface or with very slight excavations; also in the Rajpoot principality of Jeypoor in the province of Ajmeer, and in other parts of the same province, there are copper mines, and in the Carnatic, about 40 miles N.E. from Cuddapah. The metal is found in layers about two inches, and occasionally two feet thick; they are coated with ochre, and are in general flat, as if they had undergone compression. The ore exists in nearly a metallic state, without any admixture of sulphur, arsenic, or any other substance that requires separation. The best ores yield fifty, and the worst six per cent. of pure metal. The granitic mountains of Nepaul and Northern Hindustan contain much iron, lead, and copper, with a little gold in the river courses. The copper mines are quite superficial, the ore being dug from trenches entirely open above, so that the work is laid aside in the rainy season. Iron ore is found in many parts of Hindustan. There are mines of iron in Lahore and in Ajmeer. In Orissa many of the natives are iron smelters, and most of the iron sent from Balasore to Calcutta is produced in this district. In Bejapoor the working of iron furnishes employment to many of the inhabitants, who extract it by a very rude process. At Porto Novo, in the British district of South Arcot, in the presidency of Madras, extensive iron-works have been erected by a joint-stock association called the East India Iron Company; to whom also belong the iron-foundry works at Beypoor, in Malabar, on the opposite coast of the peninsula. The ore smelted at these establishments is found in great abundance and of excellent quality in their respective vicinities. The Mysore country abounds in iron. There are also forges for manufacturing steel, which are minutely described by Dr Buchanan in his account of the Mysore country.[2] In Coimbetore and in Malabar the iron mines give employment to a considerable number of persons. The process and machinery for extracting the iron are very imperfect. Iron mines were formerly worked in the district of Boglipoor, but they have been long neglected. Rich iron ores are abundant in Cutch. The ore is gathered in baskets from the surface of the earth, and yields twenty-two per cent. of iron; and the steel which is made from this ore is the finest in the world. Lead is produced in various parts; also antimony, plumbago, sulphur, alum; and there are inexhaustible supplies of coal, though the mines are not worked with any effect. Coal is raised in Burdwan in considerable quantities and of a fine quality. Saltpetre is produced in Bengal and Bahar, though its manufacture does not go beyond the eastern limits of the latter province. It might, however, be attempted with success in Bengal, where the tendency of the soil to its production is very great; and there might be manufactories of salt in almost every part of the country, but they are restricted by the Company's monopoly. In the Mysore plains the wells are salt, and the ground is frequently covered with a saline efflorescence. A range of hills, extend-from the Indus to the Hydaspes, yields the famous rock-salt of Lahore, of which they are almost entirely composed.[3] Many quarries are found in the hilly districts, which produce fine stone, that is cut by the inhabitants into pillars, flags, statues, and used for other ornamental purposes. Dr Buchanan saw several fine-grained specimens of granite, also a black stone used in the construction of Hyder's monument, and a beautiful green stone which takes on a marble polish. The hills of Guzerat contain marbles exhibiting many colours and qualities; and marbles are seen in the various tombs and monuments of ancient art still remaining in the country, finely ground and of different colours, white and yellow with red veins, and green clouded with yellow and black, of which the quarries have never been discovered.

[3] See the observations of Lieutenant Burnes on the commercial relations of the Punjab.

Diamonds are no longer found in the celebrated mines of Golconda, but they are still gathered in the bed of the Krishna, and in the province of Gundwana. Near the confluence of the Hebe and the Mahanuddy, 13 miles beyond the town of Sumbhulpoor, after the rains, the natives find diamonds in the red earth washed down from the mountains. The matrix containing them is a clay which has a red appearance like burnt bricks.[1] There are diamond mines in the S. of India, about 7 miles N.E. of Cuddapah, on both banks of the Pennar River. These mines have been worked for several hundred years, and occasionally yield large diamonds, which are either found in the alluvial soil, or are recognised by their sparkling among the gravel after it is washed and spread out, or in rocks of the latest formation. The grounds are leased on behalf of the government to private speculators at a moderate rent. In Bundelcund, also, the table-land which surrounds Pannah, wherever the ground is of a gravelly nature, produces diamonds. The soil is from two to eight cubits deep, and diamonds are found intermixed with small pebbles, though not adhering to them. A very few diamonds in the course of a year repay the labours of the workmen. The diamonds found are mostly under the value of 500 rupees, or L.50, though some reach the value of from 500 to 1000 rupees. They are weighed and sold to the merchants residing at Pannah, and are by them carried to all parts of the country. The workmen are allowed three-fourths, two-thirds, or a half of the diamonds they find, according to their size, and any man is at liberty to dig; but the business is less prosperous than formerly, and the workmen are poor. The diamond grounds are strictly guarded against the contraband trader, and the least delinquency draws down the prompt and barbarous vengeance of the rajah. These are supposed to be the diamond mines mentioned by Ptolemy. Their annual produce was estimated, in the reign of Acbar, at eight lacs of rupees. In 1750 it had fallen off to one half; the amount, now comparatively insignificant, is divided between the rajahs of Pannah, Banda, and Chirkaree.

The other varieties of precious stones found in India are the ruby from the table-land of Mysore, the beryl, the topaz, the chrysolite, garnet, cat's eye, &c. There are cornelian mines in the province of Guzerat, in the wildest parts of the jungle. They consist of numerous shafts worked down perpendicularly, about four feet wide, and several of them to the depth of fifty feet. Some of them extend at the bottom in a horizontal direction, though not to any distance; the heavy rains cause the banks to fall in, so that new openings are always made at the end of the rainy season. The nodules weigh from a few ounces to two or even three pounds, and lie close to each other in abundance, not in distinct strata, but scattered about. They are of various colours when they are found—of a blackish olive, like common dark flints; others of a lighter hue, with a slight milky tinge; though it is quite uncertain what appearance they will assume after the process of turning. They are carried to Cambay, where they are cut, polished, and formed into the fine ornaments for which that city is so highly celebrated. Beautiful jaspers and agates are also found in this district, and in other parts of India.

Manufactures.

In every country the nature and quality of the manufactures must depend on the condition of the consumers, and amongst the despotic states of Asia these naturally consist of two classes,—1*st*, of the great and powerful, in whose hands the property of the country is accumulated, and who are comparatively few; and, 2*dly*, of the mass of the people, oppressed under native rule, and sunk in poverty. Such, accordingly, has been from time immemorial the state of Hindustan; and its manufactures, which are necessarily adapted to the use of these two classes, have always consisted of exquisitely fine fabrics of cotton, for the use of the imperial court or of the rajahs and princes of the country, or of coarse stuffs for the common people; and to such perfection have they attained, that the modern art of Europe, with all the aid of its wonderful machinery, has never yet rivalled in beauty the products of the Indian loom. Yet the Hindu workman has no advantage from capital, from machinery, or from the division of labour; he prepares the raw material with his own skilful hand, in all the various stages of its manufacture; his loom and all his implements are of the rudest construction; and yet, by patience, perseverance, and unusual skill, he produces an article which is prized all over the world for its inimitable richness and beauty, as well as for its durability. The native artisan distinguishes at once these fine fabrics from all counterfeits, by the eye, the touch, and the smell. In the district of Dacca are chiefly fabricated plain muslins, variously denominated, according to the closeness or fineness of the texture; also flowered, striped, or chequered muslins, denominated from their patterns; and the thinnest sort of muslins, for the manufacture of which the province is much celebrated, as is Coromandel in Southern India for its calicoes and other piece-goods, of the most brilliant and durable colours. Other kinds more closely woven are fabricated in the western parts of Bengal; and another sort, of a more rigid texture, in every district. Coarse muslins, in the shape of turbans, handkerchiefs, &c., are made in all parts of Hindustan; and in its northern provinces plain and flowered muslins, but of inferior quality to the beautiful fabrics of Dacca. In Moultan are manufactured silks which possess a strength of texture and brilliancy of hue that have secured for them a preference in the Indian market. They are woven into shawls and scarfs, which are in great demand, and which the Indian manufacturer in other parts has never been able to rival, either in colour or durability. Carpets are also manufactured in this province, though they do not equal those of Persia. Various articles of calico are made, which still retain their Indian denominations, as khasahs, which are manufactured north and east of the Ganges; cloths of nearly the same quality are made near Tanda in Oude. Near Luckipoor, on the western frontier of Benares, in the neighbourhood of Allahabad, and also in the province of Bahar, baftaes are manufactured; sanaes in Orissa, and in the district of Midnapoor; and a similar cloth under the same denomination in the eastern parts of the province of Benares; woven silk and taffeta, both plain and flowered, in the neighbourhood of Moorshedabad; tissues, brocades, and ornamented gauzes, at Benares; plain gauzes for domestic use, in the west and south of Bengal; and at Moulda, Boglipoor, and at several towns in the district of Burdwan, mixed goods of silk and cotton. Sackcloth is manufactured from packthread in many places, especially in the northern provinces, for the clothing of the mountaineers. Cotton is made into canvas in the neighbourhood of Chittagong, Patna, and other places; and blankets everywhere for common use. A coarse cotton cloth dyed red with cheap materials is very generally used, and is chiefly manufactured in the country between the Jumna and the Ganges. Fine and coarse calicoes are dyed with permanent and fugitive colours for common use in the pro-

---

Hindustan.

vince of Benares, the city of Patna, and the neighbourhood of Calcutta. This art appears to have had its origin in India, and to have been there perfected to a degree never surpassed by Europeans. Dimities of various kinds, and damask linen, are made at Dacca, Patna, Tanda, and various other places. In Mysore, near Bangalore, silk is manufactured into different articles of dress, into strong cloths, which men, women, or boys wrap round them, and into turban pieces. These cloths are of a rich fabric, variously figured, and the pattern, if ordered, is elegantly wrought in gold thread. Turbans are made of cotton and silk. Thin white muslins with silk borders ornamented with gold and silver, and plain green muslins with silk borders, are manufactured for female dresses; also striped and chequered muslins; cloth like the khasahs of Bengal, for wrapping round the shoulders of men, sometimes with striped or silver borders. Handkerchiefs with red borders, a coarse thick white cotton cloth with red borders, and turbans ornamented with silver and gold thread at the ends, are also made in this district; and the dyeing of cotton cloth, cotton thread, and silk, is carried on by a set of people who act as tailors, cloth-printers, and dyers. Tanneries are established, and manufactories of oil.[1] At Chennapattana there are manufactories of glass-ware and of glass rings, universally worn as bracelets by the women of the Deccan. Steel wire is also made here for the strings of musical instruments. At Vizigapatam, in the Northern Circars, the inhabitants are very expert in carving curious little boxes of ivory and bone. Throughout Southern India manufactories of cotton and silk are generally established. In the Northern Circars the principal part of the East India Company's investment of piece goods was formerly provided. This country, extending about 500 miles along the coast of Coromandel, from the River Kistnah to the borders of Cuttack, has from very early times been the seat of an important and extensive manufacture of cotton piece-goods, of which the description of calicoes known as Madras long cloths and salempores are the chief, and, with Masulipatam dyed handkerchiefs, and other kinds of goods for the African and West India trade, have, until lately, been in great demand. Masulipatam goods have, however, for some years been entirely superseded by the manufactures of Manchester and Glasgow; and in all appearance the Northern Circars will at no distant period of time be deprived of the manufactures of white calicoes also.[2] A great change has indeed been brought about in the manufactures of India by the introduction of British goods, which, in many branches, have supplanted those of the country; the poor Hindu, notwithstanding the low rate at which he works, is thus undersold in his own market by the manufacturers of Manchester and Glasgow; and this competition of British goods nearly ruined the native manufacturers of India, deprived the workmen of employment, and reduced them to great distress; so that the directors remark concerning the Indian trade, that "it exhibits the picture of a commercial revolution, productive of much present suffering to numerous classes in India, and hardly to be paralleled in the history of commerce."

Commerce.

Hindustan, from its great extent, and the diversity of its soil and climate, supplies the materials of an extensive commerce. Its internal trade is great, whilst its rare and precious products are exported to the remotest regions of the world. An extensive commerce takes place between Bengal and the other maritime districts, and the western provinces of Hindustan, consisting in the exportation of grain from the corn districts, in exchange for salt, a great staple; for betel-nut, sugar, raw silk, silk and piece goods. From the native states of Central India Malwah opium is sent down to Bombay for exportation to China. In Bengal the culture and manufacture of opium are conducted under a state monopoly, and the produce is transmitted to Calcutta, where it is disposed of by public sale. The holy city of Benares is a great mart of trade, in which are exchanged the shawls of the north for the diamonds of the south, and for the muslins of Dacca and the eastern provinces; and it has, besides, very considerable silk, cotton, and fine woollen manufactures of its own, the produce of which is exchanged for other commodities. Through the northern provinces of Delhi and Lahore a great trade is carried on between the hill countries and the plains. The inconsiderable town of Hurdwar or Hardiwara, being a celebrated place of Hindu pilgrimage, is a great commercial emporium, to which multitudes resort for the purposes of trade, as well as from piety. This great annual concourse takes place in the spring, when the produce of the northern and western countries is exchanged for the manufactures of the lower provinces. The principal articles brought here for sale from Cabul, Candahar, Moultan, and the Punjab, are horses, mules, camels; some of these from Balk, Bokhara, and the countries on the northern side of the Hindu Coosh Mountains; a particular species of tobacco, antimony, assafœtida, dried fruits, such as apricots, figs, prunes, raisins, almonds, pistachio nuts, and pomegranates; from Cashmere and Amritsir, shawls, dootas, and pattoos; spotted turbans, looking-glasses, toys, with various manufactures in brass and ivory from Jeypoor; shields from Rohilcund, Lucknow, and Silhet; bows and arrows from Moultan and the Doab; rock-salt from Lahore; baftas and piece-goods from Rahn, a large city in the Punjab. The country of Marwar also supplies many camels, and a species of flannel called loo. In exchange are brought from the British provinces Kharwa muslins, mushroo or sarsnet, and woollen cloths, the coarsest of which only find a market. In this fair, Dutch and Venetian coins are current; and some toys of European manufacture were seen exposed to sale by Mr Webb. The northern merchants by whom it is frequented assemble at Amritsir in caravans about the end of February, and pursue their route in an easterly direction through the territories of the protected Seikh powers. Still farther to the N. and W. the provinces of Lahore and Moultan export to the countries to the W. of the Indus, sugar, rice, indigo, wheat, and white cotton cloths, hides, &c. The imports are swords, horses, fruit, lead, and spices; and into all these countries European goods are imported from the lower provinces. The southern provinces export to Bengal, pepper, betel-nut, sandal-wood, and cardamums, teak timber, &c.; whilst they receive in return salt and rice, cotton cloths, and articles of European manufacture.

A very considerable coasting trade is carried on between the different parts of Hindustan. Bengal exports to Madras and the coast of Coromandel, grains of different descriptions, sugar, saltpetre, molasses, ginger, long pepper, oil, silk wrought and unwrought, muslins, spirits, and provisions. The returns are salt, red wood, fine long cloth, izarees, and chintzes. From the Malabar coast the imports are sandal-wood, coir rope, pepper, cardamums; and the returns are generally in the annual supplies which Bombay receives from Bengal. From Bombay are brought teak timber, elephant's teeth, lac, &c.

From the reputed wealth and precious produce of India foreign nations were always desirous to participate in its trade. Prior to Alexander's expedition to the East it was scarcely known to the Greeks, nor is it certain that they had ever seen its productions. But we know that these were brought to Rome, especially silk, which so allured the vanity of the Roman ladies that it sold for its weight in gold. Other valuable commodities of India, such as calicoes, muslins, aromatics, ivory, diamonds, pearls, and other gems, precious aromatics, the pepper of Malabar, turtle shell, &c., and some dry sugar and indigo, were also imported into Alexandria, the chief emporium of eastern commerce, and were naturally attracted to the great metropolis of the ancient world. This trade was carried on from Myos Hormos, the chief port on the Red Sea, whence, after the conquest of Egypt by the Romans, the annual fleets, sometimes of 120 vessels, set sail, and, under the propitious influence of the S.W. monsoon, boldly stretched across the Indian Ocean for the western coast of Hindustan, which they reached in about forty days; and afterwards extended their voyage round Cape Comorin to the coast of Coromandel and the mouths of the Ganges. The high price received for these eastern luxuries in Rome encouraged the merchants to provide larger vessels, and a band of archers to defend them against the pirates, who then, and until very lately that they were extirpated by British ships of war, infested the western shores of India. The commodities of the East being landed at Myos Hormos, were carried on camels to Coptos, the seat of a flourishing trade, and thence by sea to the Nile, whence they reached Alexandria by water carriage, and were re-shipped to the different ports on the Mediterranean. The produce of India was also brought to Europe by other routes—namely, by the way of Palmyra, then a flourishing city, and thence to Rome and other western countries, through the ports of Syria; or across the Himalaya Mountains to the Oxus, thence to the Caspian, and afterwards to the Black Sea, and finally to its ulterior markets in Europe. But though there was a demand in Europe for the produce of India, there was no demand in India for the produce of Europe; and bullion was the only article that could be sent out in exchange. The annual drain of gold from Rome and its provinces for Indian goods was estimated by Pliny at 500 sestertia, equal to about L.400,000. In the convulsions which followed the decline of the Roman empire, the trade of the East was successively engrossed by the Persians and Arabians. The latter, in the year 636, built the city of Bassora, which soon grew into a great commercial mart; and to this place, and to Ormus, long celebrated for its vast riches and its trade, the spiceries and merchandise of India were brought, and distributed through the various ports of the Mediterranean. After the expulsion of the crusaders from Syria and Egypt, Alexandria again became the chief entrepôt of eastern produce, whence it was carried to Italy by the Venetians and others, and distributed throughout Europe. But the discovery of a passage to India in 1495 by the Cape of Good Hope changed the course of this trade, which now entirely left the Italians, and was engrossed by the Portuguese for nearly a century without any molestation from European rivals. At length the Dutch and the English became their competitors, and established joint-stock companies, with the exclusive privilege of the eastern trade. But their anticipations of profit were not realized. The great distance of Europe from India, and the want of an equivalent for its produce, precluded any extensive intercourse; the trade accordingly bore a very small proportion to the trade of the country; and being besides cramped by monopolies, it never attained its natural growth. In 1773 the average exports of Britain to India amounted to about L.489,000 a year; in 1793, on a like average, to about a million a year; and it does not appear that a greater trade was carried on with India from any other part of Europe. The commerce of nations is limited to the surplus produce which they can mutually exchange; and, from the great distance between India and Europe, this surplus produce was long confined to those few articles which, containing a great value in small bulk, could bear the expense of a long voyage. The demand was also altogether on the side of Europe, and its trade with India consisted merely in the purchase, with bullion, of a small quantity of precious articles for the consumption of the rich. The progressive improvement of industry in Europe, together with the entire opening of the trade to India and China since the year 1834, has occasioned not only a greater exportation of British goods, but a change also in the nature of the trade. It is not so much the produce of the labour as of the climate and soil of India, which no ingenuity can supply, that is in demand in Britain; and accordingly, whilst the import of Indian manufactures has fallen off, that of the raw material, and many varieties of vegetable produce, has increased. Thus the importation of cotton piece-goods—namely, white calicoes and muslins—which amounted in 1814 to 1,266,608 pieces, had decreased in 1853 to 428,294 pieces; whilst within the same period the importation of cotton wool had increased from 2,850,318 lbs. to 181,360,994 lbs., and the exportation of cotton manufactures in a similar ratio. Even the incomparable muslins of Dacca are in less demand since the introduction of British goods.[1] Thus, in the progress of the trade between India and Europe, the former country, notwithstanding its boasted wealth and superior industry, has taken the lowest place, exporting her rude produce for the manufactures of the richer country. This is the nature of the trade carried on between Britain and America and the countries in the N. of Europe, and is a sure index to the respective progress of the two countries in wealth and improvement. Those countries which cannot manufacture their own rude produce send it to Britain, which abounds in capital, and still more in art and industry; and both countries are benefited, the poorer country exchanging its surplus produce for a supply of manufactures of which it is in want, and the richer country the produce of its overflowing capital, for a supply of the raw material, which its own soil does not afford. This is now the relative condition of Great Britain and India. The former having outstripped the latter country in industry and wealth, sends out a supply of cheaper goods than the native workman can furnish; and so prodigious have been the improvements in machinery, that the raw material of cotton is imported from India, and, being manufactured in Britain, is re-exported and sold at a cheaper rate than it can be made at home, though loaded with the expense of a double voyage across half the globe; and thus it has become an important staple in the trade of Great Britain with the East. A notion was long and successfully propagated by the advocates of the monopoly, that the Hindus, from their poverty and their simple habits, would never become extensive consumers of European goods, and that the demand was amply supplied by the exports of the East India Company. Evidence to this effect was given before the committee of the House of Commons in 1810 by Sir Thomas Munro and other eminent servants of the Company. But such statements have been completely refuted by the rapidly increasing exportation of British goods to India since the complete opening of the trade in 1834. This will appear from the following table:—

[1] See Report of Lords' Committee on the Affairs of the East India Company, Evidence of W. Chaplin, Esq., p. 179.

The goods exported, as they are enumerated by Mr Rickards in his valuable work on India, consist of all the staple manufactures of Britain. "Woollens and cottons," he mentions, "of every variety and value; manufactured silks; hardware of all descriptions; iron, copper, lead, tin, and spelta, in large quantities; marine and military stores; machinery for various uses; glass-ware of the metal specimens, down to articles of the commonest use; china-ware or porcelain, the same; jewellery of all sorts; gold and silver plate and ornaments; clocks, watches, furniture, carriages, harness, haberdashery, hosiery, stationery, books; in short, every article of luxury, comfort, or convenience, which British industry can produce."[1] According also to all the most correct observers of Indian manners, the taste for European fashions, luxuries, and comforts, is rapidly extending among the Hindus. Bishop Heber, in his interesting journal of a tour through India, strongly confirms this fact. "The wealthy natives," he observes, "now all affect to have their houses decorated with Corinthian pillars, and filled with English furniture; they drive the best horses and the most dashing carriages in Calcutta. Many of them speak English fluently, and are tolerably read in English literature; and the children of one of our friends I saw one day dressed in jackets and trousers, with round hats, shoes, and stockings."[2] At Benares he found "English hardware, swords, shields, and spears, from Lucknow and Monghyr; and those European luxuries and elegancies, which are daily becoming more popular in India, circulate from hence through Bundelcund, Gorruckpoor, Nepaul, and other tracks which are removed from the main artery of the Ganges."[3] At Nusseerabad, in the province of Berar, the same traveller mentions that "English cotton cloths, both white and printed, are to be met with commonly in wear among the people of the country, and may, I learned to my surprise, be bought best and cheapest, as well as all kinds of hardware, crockery, writing desks, &c., at Pallee, a large town and celebrated mart in Marwar, on the edge of the desert, several days' journey west of Joudpoor, where, till very lately, no European was ever known to have penetrated."[4] In short, it appears that British and other European manufactures, from their quality and cheapness, are everywhere in demand. They penetrate into the remotest districts of Asia; and now that the termination of the East India Company's monopoly, which took place in 1834, has laid open Hindustan to the capital and enterprise of Britain, experience proves that an equal demand for them may be anticipated in that country. We subjoin the following tables, containing a view of the extent and value of the trade of India to all parts of the world. The excess of exports over imports arises from the necessity of making annual remittances to Great Britain to defray the interest of debt, and to meet the expenditure of the home government.

The British possessions in India are intermixed with the dominions of various native governments, with which political relations varying in nature and degree are maintained. The following table exhibits the relative area and population of the presidencies of Bengal, Madras, and Bombay, and those also of the native states of Hindustan[1] :—

Area and Population of the British Presidencies and the Native States of India.

British Presidencies.	Division.	Area in square miles.	Population.
Bengal	Lower Provinces	119,633	37,262,163
	Saugur and Nerbudda Territories	15,388	1,929,587
	Jaloun	1,873	176,297
	British Mhairwarrah	282	37,715
	Umballah, Loodianah, and Territory lately belonging to Seikh chiefs	4,559	2,311,969
	North-eastern frontier, including Assam, &c.	29,900	1,180,935
	Arracan	15,164	321,522
	South-west frontier, including Sumbulpore, Chota Nagpore, &c.	30,589	2,627,456
	Nagpore or Berar	76,432	4,650,000
	The Punjab and Kooloo Territory	78,447	9,153,209
	Tenasserim Provinces	29,168	115,431
	Jhansi	2,532	200,000
	The Sunderbunds, &c.	6,500	Unknown.
	North-western Provinces, including Delhi, Agra, Benares, &c.	72,052	30,271,885
	Butty Territory, Deyrah Dhoon, Kumaon, Gurhwal, &c.	13,599	600,881
	Total	496,118	90,839,050
Madras	Regulation Provinces	116,248	19,847,305
	Non-Regulation Districts	19,444	2,454,392
	Total	135,692	22,301,697
Bombay	Regulation Provinces	57,723	9,015,534
	Non-Regulation Districts	62,342	2,093,533
	Total	120,065	11,109,067
The Eastern Settlements of Singapore, Prince of Wales Island, and Malacca.		1,575	202,540
Native States within the Presidency of Bengal	Oude, Hyderabad, Bhopal, Bhurtpore, Scindias and Holkar's Dominions, &c.	503,554	38,259,862
Do., within the Presidency of Madras	Cochin, Mysore, Travancore, &c.	51,802	4,752,975
Do., within the Presidency of Bombay	Guzerat, Cutch, Colapore, &c.	60,575	4,460,370
Foreign European Possessions	French (Pondicherry, &c.)	188	171,217
	Portuguese (Goa)	1,066	313,262

Abstract of the foregoing.

		Area of square miles.	Population.
British Possessions	Bengal	496,118	90,839,050

	Bombay	120,065	11,109,067
	Eastern Settlements	1,575	202,540
Native States	Bengal	503,554	38,259,862
	Madras	51,802	4,752,975
	Bombay	60,575	4,460,370
Foreign European States	French	188	171,217
	Portuguese	1,066	313,262
	Total of India	1,370,635	172,410,040

Races.

A country of such vast extent, under one common appellation, and subdivided by many impassable tracts of mountain and jungle, comprises, as may readily be imagined, numerous races, differing in their origin, in their physical aspect and frame, in their manners, customs, in their respective advances in civilization and pursuits, as well as in their modes of faith and language; and accordingly Bishop Heber, who excels all other writers in the delineation of Indian manners, observes, that "it is a great mistake to suppose that all India is peopled by a single race, or that there is not as great a disparity between the inhabitants of Guzerat, Bengal, the Doab, and the Deccan, both in language, manners, and physiognomy, as between any four nations of Europe;" and in another passage he says, "the inhabitants of the presidencies of Madras and Bombay, and of the Deccan, are as different from the nations I have seen, and from each other, as the French and Portuguese from the Greeks, Germans, and Poles."[2] A minute account of the various races and castes, with the still more various subdivisions into which the inhabitants of Hindustan are distinguished, would fill a volume, and would besides be exceedingly tedious. A general description, however, of the most remarkable tribes which compose the mixed population of this extensive country, forms an essential part of its history. The great division of the people is into Hindus and Mohammedans, in the proportion of about seven to one. And these two great classes are distinguished not more by their religion than by their peculiar disposition and character. The Hindu is careful, penurious, and abstemious in his habits; timid, obsequious, and fawning in his manners; chiefly attaining his ends by deceit and cunning, the usual resource of weakness; whilst the Mussulman still retains the haughty and irascible character of a conqueror, and his hostility to the English, which he is at no pains to conceal, like the Hindu, by an obsequious demeanour. He is withal prodigal, luxurious, fond of ease and pleasure, and dissolute to excess in his morals; more courageous and martial, however, with more energy of purpose and elevation of sentiment, and more cultivated, than the Hindu of Bengal. In the population of Bengal these two races may easily be distinguished from each other; and amongst the Mohammedans, the Mogul, the Afghan, and their immediate descendants, may be known amongst the native Mussulmans. The features of the Bengalee distinguish him from the other inhabitants of Hindustan. He is stigmatised as of a cowardly disposition, and, from whatever cause, is not esteemed throughout the country. With these two principal classes are intermingled, in very small proportions, British, Armenians, a peaceable race, and highly honourable in their dealings, Portuguese, and other Christians. The Parsees are numerous in the island of Bombay, where they amount to 114,698; they are descendants of the Guebres or fire-worshippers, are a fine race, being generally engaged in traffic, and distinguished in their dealings by the highest integrity and intelligence. The Jews are numerous in India, and many are to be found in the Bombay army, where they have often behaved bravely. The Asiatic Jews are distinguished by a large Roman nose. The Mahrattas, a powerful tribe, have been long distinguished in the wars and politics of India. They are chiefly found within the presidency of Bombay and the province of Nagpore, recently lapsed to the British government. They were originally a pastoral and warlike people from the mountains of Berar, who with a host of cavalry invaded and desolated the adjacent provinces with fire and sword, and at length acquired an extensive empire. Minute shades of difference prevail amongst them, but no distinctions of caste; every Mahratta eating with his neighbour, unless, which often happens, he be expelled from his caste. They are not a military caste, as appears from the names of farmer, shepherd, and cowherd, by which their principal tribes are known; and also from their exterior, which marks an origin different from that of the military Rajpoot. They are of a diminutive size, generally badly made, and of a mean look and rapacious disposition; whilst the Rajpoot has both personal grace and dignity. The memorable battle of Paniput, fought in 1761, gave a blow to the Mahratta power, from which it never recovered; and the confederacy was entirely dissolved in 1817, when the peshwa, the great feudal chief of the empire, surrendered to the British, and was by them confined as a state prisoner. The nation derives its name from Mahrat, a province of the Deccan; though it is the opinion of some that the Mahrattas migrated from Persia about 1200 years ago.[1] The Mahratta language is widely spread over India. It is remarkable, that in proceeding northward into Northern and Central India, and into the Rajpoot states, the people far excel in strength and stature the feeble Hindu of the southern provinces, being fully equal in their bodily frame to Europeans. "They despise," says Bishop Heber, "rice and rice eaters, feeding on wheat and barley bread, exhibiting in their appearance, conversation, and habits of life, a grave, proud, and decidedly a martial character, accustomed universally to the use of arms and athletic exercises from their cradles, and preferring very greatly military service to any other means of livelihood." The character of the Rajpoots, the Sikhs, and the Jauts, fully answers to this animated description of a warlike race. The tribe of Jauts or Jats was little known in India till about the year 1700, when they migrated from the banks of the Indus, and became industrious cultivators in the Doab, or the country between the Ganges and the Jumna. During the civil wars which ensued on the death of Aurungzebe, they acquired a large extent of territory, in which they built forts, and accumulated wealth. They were noted plunderers; and it was out of the spoil taken from Aurungzebe's army in its retreat from the Deccan that the fortress of Bhurtpore was erected, in the gallant defence of which against the British they fully sustained the character of brave soldiers. Their claim to the distinction of a military caste has, however, been disputed; and it is said, that though success has emboldened them to assume that honourable title (*khetri*), they were originally a low tribe of sudras or labourers. They also affix to their name *singh*, a lion, which probably belongs only to the Rajpoots. The Jauts are said by Bishop Heber to be the finest people in bodily advantages and in martial spirit which he had seen in India, and their country one of the most fertile and best cultivated. They have a high character for valour throughout Hindustan; insomuch, adds the writer above quoted, "that when I was passing through Malwah, 'gallantee shows,' like those carried about by the Savoyards, were exhibited at the fairs and in the towns of that wild district, which displayed, amongst other patriotic and popular scenes, the red coats driven back in dismay from the ramparts, and the victorious Jauts pursuing them sabre in hand."[2] The lower classes of Jauts found in the barren tracts of Ajmere, and in Northern India, are however differently described, being of small stature, ill-looking, and black in complexion, and their condition that of squalid poverty. The Sikhs were originally a religious sect, of which the founder, Nanak, was born A. D. 1419, in the province of Lahore; and the word Seik, properly Sikh or Siksha, in the old Sanscrit, signifies a disciple or devoted follower. He left two sons, from whom are descended 1400 families, called Shahzadehs, who live at Dera, in the Punjab, highly respected. His successors were spiritual chiefs, until the year 1675, when Gooroo Govind, a warrior, succeeded. He converted the Sikhs from religious sectaries into ferocious soldiers; he changed their name from Sikh to Singh, signifying a lion, the title claimed and highly prized by the Rajpoots; and enjoined his followers to cut off their hair, or to shave their beards. The tribe consider this chief to be the founder of their political independence, and Nanak of their religion. The Sikhs acquired power during the convulsions that followed the death of Aurungzebe, and after the invasion of Nadir Shah. They were severely checked by the Mahommedans, and were nearly exterminated by the victorious Afghans after the battle of Paniput in 1761. But their valour still triumphed in the struggle, and led to the acquisition of the Punjab, over which they retained dominion until the death of their ruler Runjeet Singh, soon after which event the country of the "Five Rivers" fell to the British by conquest, and became incorporated with their vast empire of India. In horsemanship the Sikhs are not excelled by any other nation either of Europe or Asia. Colonel Todd, in his great work on Rajast'han, describes the appearance of the Rajpoot cultivators in the valley of Odeypoor, who came to meet him in a body, "as being so striking as to draw forth the spontaneous exclamation from his friend, 'what noble looking fellows!" "Their tall and robust figures," he adds, "sharp aquiline features, and flowing beards, with a native dignity of demeanour, though, excepting their chiefs, who wore turbans and scarfs, they were in their usual labouring dresses, immense loose breeches, and turbans, compelled admiration and respect."[3] Their cast of countenance is Hindu, somewhat altered by their long beards; they are active, and more robust than the Mahrattas, owing to better living and a healthier climate; and rival in courage the most renowned tribes of India. They evince in battle the most determined contempt of personal danger, and are easily roused to desperation by prejudice or religion; they act as infantry in foreign armies, and as cavalry at home. Their address is bold and somewhat rough; they speak invariably in a loud bawling tone of voice; and are dissolute in their habits, indulging so freely in spirituous liquors, which their religion allows, though tobacco is prohibited, and in opium and bang, an intoxicating drug, that a Sikh soldier is rarely sober after sunset. The Sikhs are allowed to eat the flesh of all animals except the cow. They are strict in their religious observances; and converts, whether Hindu or Mahommedan, must give up all customs which infringe the tenets of Nanak, or the military institutes of Gooroo Govind. The military class highly relish the flesh of the jungle hog, of which they compel Mahommedan converts to partake, and also to abstain from circumcision. The Sikh merchant or cultivator, if he be a Singh, is still a soldier in his habits, as he wears arms, and is well trained from his infancy to the use of them. The original followers of Nanak, the Kalasa Sikhs, differ widely from the warrior tribe. They are as pliant, versatile, and insinuating in their manners as the lower class of Hindus, whom they so much resemble in their dress and appearance as not to be readily distinguished. The descendants of Nanak are a mild, inoffensive race; and the other religious tribes retain their peculiar manners.

---

[1] Notwithstanding the ravages committed by incessant wars and revolutions, as well as by famine and pestilence, their usual concomitants, India has, from the earliest times, been a densely-peopled country. In different states of society, the law of the increase of mankind will vary according to their relative circumstances and position, and the same or nearly the same principle will be found to apply to those classes who are placed at the opposite extremities of the scale. Amongst a people who are possessed of affluence, or the means of commanding the necessaries and comforts of life, the exercise of moral restraint is unnecessary; amongst those who are reduced to a mere physical subsistence, without the possibility, and consequently without the desire, of improving their condition, it will be disregarded; and hence the same results will follow from causes in their own nature diametrically opposite. But in India the great mass of the population have for ages been placed in a situation which excludes all idea of improvement; and religion has lent its powerful aid to obstruct the operation of those natural causes which, in other countries, have served to ameliorate the condition of the people. It may, however, be permitted to hope, that though India always has been, it will not always be, what it now is; that the extension of commerce, under the protection of a vigorous and impartial government, will awaken new ideas in the minds of the people; that security to person and property will give a strong stimulus to industry; that the habitual contact with a higher and more rational form of civilization will serve to mitigate their prejudices, and, in time, to destroy the influence of a debasing superstition; and that, in proportion as their wants are multiplied, their efforts to ameliorate their condition will be increased.

The Rajpoots inhabit the Rajpoot states of Mewar or Odeypoor, Marwar or Joudpoor, Bicanere and Kishenagur, Kotah, Boondi, Amber or Jeepoor, Jesselmere, and the Indian desert to the valley of the Indus. They are the children of the sun and the moon; and, in memory of their great ancestor the radiant Surya, or Apollo, many of them wear badges of gilt metal round their necks with the image of a sun and moon on horseback. The lineage of both the solar (Soorya) and lunar (Indu) tribes is given by Colonel Todd, on the authority of the Puranas (sacred books), a copy of which, obtained from the library of the Rana of Odeypoor, he carefully consulted, in the presence of a body of learned pundits. This work contains the valuable results of his learned researches into the antiquities and history of the Rajpoot tribes, which were conducted with all the patience and perseverance that an enthusiastic devotion to the subject can alone inspire; and being guided by philosophy, and the most profound knowledge of oriental literature, have thrown great light on the history and character of the ancient inhabitants of Rajpootana. Vyasu, the Hindu historian, gives fifty-seven princes of the solar line from Menu to Rama; and fifty-eight from the same period of the lunar race, from Buddha, its founder, to Krishna. The establishment of these two grand races in India is fixed by Colonel Todd at about 2256 years before the Christian era. From Rama all the tribes termed Sooryavansa or Race of the Sun, claim their descent, namely, the present princes of Mewar, Jeepoor, Marwar, Bicanere, and their numerous clans; whilst from those of Buddha and Krishna the families of Jesselmere and Cutch, extending over the Indian desert, from the Sutledge to the ocean, deduce their pedigrees. Colonel Todd draws a parallel between them and the ancient Scandinavians and Scythians; and the striking resemblance that appears in the manners, customs, and religious opinions of the two nations, he insists, strongly suggests the idea of a common origin. These ancient tribes were devoted to the god of war; and the Rajpoot, he observes, "delights in blood; his offerings to the god of battles are sanguinary, blood and wine. The cup of libation is the human skull. He loves them because they are emblematic of the deity he worships; and he is taught to believe that Hor loves them, who in war is represented with the skull to drink the foeman's blood, and in peace is the patron of wine and women. With Parbutti on his knee, his eyes rolling from the juice of the p'foot and opium, such is this Bacchanalian divinity of war." "Is this Hinduism," he adds, "acquired in the burning plains of India? Is it not rather a perfect picture of the Scandinavian heroes."[1] This hypothesis of a common origin Colonel Todd further supports from the Rajpoots slaying the buffalo, hunting the boar and the deer, shooting ducks and wild fowl; from their ancient use of the war-chariot, as appears from the inscriptions and engravings on their monuments; from the order of the birds common amongst them; from their passion for gaming and intoxicating liquors; from their sensual and slothful habits; from their funeral ceremonies, particularly from their immolation of females, a barbarous custom now abolished through the strenuous exertions of the British government. The Rajpoots claiming so splendid a descent are distinguished above all other tribes by rank and pride of birth, and high aristocratic feeling; and hence the origin of a barbarous custom among the chiefs of putting to death their female children as soon as they were born, lest they should contract any base alliance. Others say that this custom was occasioned by the practice amongst the Rajpoot princes of providing splendid dowries for their daughters, by which they were frequently impoverished, and to avoid which they murdered them in infancy. Colonel Todd, the depth of whose researches into the ancient literature of the Hindus appears in his accurate and lively delineation of the national character and manners of the Rajpoots, ascribes to their chiefs a more ancient and chivalrous descent than many of the royal houses of Europe. "From the most remote periods," he observes, "we can trace nothing ignoble, nor any vestige of vassal origin. Reduced in power, circumscribed in territory, compelled to yield much of their splendour and many of the dignities of birth, they have not abandoned an iota of the pride and high bearing arising from a knowledge of their illustrious and regal descent. The poorest Rajpoot of this day," he adds, "retains all the pride of ancestry, often his sole inheritance; he scorns to hold the plough, or to use his lance but on horseback. In these aristocratic ideas he is supported by his reception among his superiors, and the respect paid to him by his inferiors." These honours and gradations of rank are supported by peculiar privileges, each of the superior orders being entitled to a banner, to kettle-drums, preceded by heralds, and silver maces, with peculiar gifts and personal honours in commemoration of some exploit of their ancestors. Armorial bearings are used by the martial Rajpoots; a golden sun on a crimson field adorns the great banner of Mewar; those of the chiefs bear a dagger, whilst others display a fine coloured flag; and the lion rampant in an argent field was the warlike emblem of the now extinct state of Chanderi.[2] The Rajpoots are divided into thirty-six royal races, described by Colonel Todd; to each is attached a bard, who is acquainted with all the peculiarities, religious tenets, and ancient history of the tribe. These are subdivided into an infinite variety of lesser clans, each more or less honourable as they can trace their pure descent from the original and illustrious founders of their race. The character of the Rajpoots, as given by Bishop Heber on the authority of Captain Macdonald, the political resident of the Company in that district, is far from favourable. "The people," he observes, "who are generally oppressed, and have been, till very lately, engaged in incessant war, have the vices of slaves added to those of robbers, with no more regard to truth than the natives of our own provinces, exceeding them in drunkenness, fondness for opium, and sensuality, whilst they have a blood-thirstiness from which the great mass of the Hindus are very far removed. Their courage, however, and the gallant efforts they made to defend their territories against the Mahrattas, deserve high praise." They are extremely attached to their respective chiefs, to whom they yield a feudal obedience. The lands are let at low rents, on the condition of military service, every village furnishing its contingent of horsemen on the shortest notice. One of the chiefs who visited the above traveller, and who is said by him to have been a striking specimen of the tribe, is described as "young and handsome, but dirty in his dress, boisterous in his manner, talking with a great deal of gesticulation, many winks, nods, beckonings, and other marks of intelligence; and half drunk." Colonel Todd's work contains an accurate and instructive delineation of the manners and feudal relations amongst the Rajpootana chiefs; of their martial virtues, their romantic fidelity and honour, and their high pride, the parent at once of the noblest deeds and the deepest crimes; with which, according to their enthusiastic annalist, Colonel Todd, their history is stained. Family feuds are frequent amongst them, and last for centuries. They are handed down, as an inheritance, from generation to generation; and thus the debt accumulates with interest, "the deep reversion of delayed revenge," till it is extinguished in the blood of the hostile tribes. Hence murders, burnings, poisonings, mingle in their domestic annals with traits of generosity and romantic valour; and the modern Rajpoots, though they are certainly not improved, differ little in their manners and prejudices from their ancestors.[1]

[2] *Ibid.* p. 138.

The Bheels, another predatory tribe, inhabiting the mountains situated near the Nerbuddah and the Tuptee rivers, thence extending northward towards Rajpootana, westward towards the province of Gujerat, where they meet the Coolies, and eastward to Gundwana, where they come in contact with the Gonds, two other predatory tribes, are supposed to have been the aborigines of Central India. All these tribes are averse to industry, and subsist by plunder, by hunting, or by cultivation, when all other expedients fail. The Coolies near the sea-coast lived, until lately, by fishing or piracy. The Bheels inhabit the interior; and during the unhappy period of disorder and rapine in India, terminated by the triumph of the British arms in 1817, they had by their inroads laid waste several districts, and were rapidly increasing in power. They were frequently hired by the native chiefs to assist in their desolating wars, as horsemen or as infantry, armed with bows and arrows, and nearly naked. Thieves and savages as they are, Bishop Heber found that the British officers stationed in that district thought them, on the whole, a better race than their conquerors. "Their word," he observes, "is more to be depended on; they are of a franker and livelier character; their women are far better treated, and enjoy more influence; and though they shed blood without scruple in cases of deadly feud, or in the regular way of a foray, they are not vindictive or inhospitable under other circumstances, several British officers having with perfect safety gone hunting and fishing into their country without escort or guide except what these poor savages themselves cheerfully furnished for a little brandy." The Bheels in the south of Malwah were partly reclaimed by the wise and conciliatory policy of Sir John Malcolm. In the mountainous tracts of the province of Guzerat they were at first harshly treated, and severity only tended to confirm their primitive habits. Subsequently a milder and more enlightened course of policy was pursued by the British government, and the results proved highly satisfactory. "The Bheels," says Captain Graham, "from outcasts have become members of civil society, daily rising in respectability, and forming useful and obedient subjects of the state." The Gonds are a miserable race in Gundwana, occupying the fastnesses of the mountains. They approach nearly to a state of nature, and frequently descend from the mountains, especially during the harvest, to plunder their ancient inheritance in the plains. Having within the last fifty years acquired a taste for salt and sugar, they have begun to cultivate the land, in order to obtain these luxuries. The Gonds bear a striking resemblance to the African negro. The Grassias are another race of plunderers who are numerous in Gujerat, the most western province of India. They have or pretend to have ancient claims on the land, many portions of which were either surrendered to them by the proprietors for the secure possession of the remainder; or they received an annual payment in money (toda) in full of all demands, as black-mail was paid in Scotland to the Highland robbers during the disorders of the feudal times. The Grassias seldom levied these claims in person; but, assuming the character of chieftains, they rallied around them a band of adventurers, who levied their *grassia* claim, and who, under this authority, plundered and laid waste the country. These Grassias are of no sect or caste; they include Hindus and Mahommedans indiscriminately. But, of all these predatory races in Hindustan, the Coolies, who haunt the shores of the great salt marsh called the Runn, near the Gulf of Cutch, are the most untameable. They resist every approach to civilization, and pride themselves upon their mean and filthy dress. The tribes of thieves which are found in India, under the various designations of Grassias, Catties, Bhatties, or wandering outlaws who worship the sun and moon, Coolies, Bheels or Mewassies, Meenas, Buddicks, Cozauks, and the like, generally wander along the rugged banks of rivers, or among inaccessible mountains. The Bhats are a singular race, who are most numerous in Gujerat. Some are cultivators, others beggars and itinerant bards or traders; whilst a few are contractors for the payment of the public revenue, receiving a small per centage on the amount, or guarantee the observance of private agreements and awards. The Cherons are a sect of Hindus nearly resembling the Bhats in their manners and customs. They are carriers of heavy goods, such as grain and other articles, in which they are also dealers, and possess large droves of cattle for carriage. They are likewise engaged to protect travellers in the wild parts of the country, and take an oath to die by their own hands in the event of those who are under their protection being plundered; and the superstitious thieves of Hindustan are always overawed by this threat of the Cherons, whom they hold in great veneration.[2] The population of Hindustan contains other tribes or sects, too numerous and diversified to be described in detail, and differing, if not in language, at least in dialect, and in their manners, customs, and occupations. The Phasingars in the south of India, and the Thugs, are professional murderers; the latter are composed of men of all castes, even Brahmins, who, when murders are committed, are frequently the chief directors in the scene. Their practice is to decoy the traveller into the midst of their band, and then, drowning his cries by the noise of pretended revelry, to strangle him by suddenly throwing a noose round his neck, after which the body is cast into a grave previously dug for it. But this tribe, together with the Gwarriahs, who live by stealing children, are fast disappearing under the strict rule of the British. The Brinjarrees and Loodanahs, or carriers of grain, are a singular wandering race, who dwell in tents, and have no home; passing their whole time in transporting grain from one part of the country to another. They move about in large bodies with their wives, children, dogs, and loaded bullocks; and carry arms, with which they stoutly defend themselves against petty thieves. In war they are allowed to pass and repass quietly as neutrals between hostile armies, and to sell supplies of grain to either party. It was from the Brinjarrees that Lord Cornwallis received all the supplies for his army when he advanced against the capital of Mysore in 1799. The Oorians, a singular race, who inhabit Orissa, are distinguished by their feminine appearance, so that they are often mistaken for women. They are timid, dissolute in their manners, and more practised in low cunning than any other people in the East, though they are said to be honest and industrious. The pastoral tribes, the Todawars or Toderies, and the Koties, inhabit the table-land of Mysore; the first a manly race in features, and of a proud and independent character, strongly resembling the ancient Romans; the second more diminutive, with darker complexions, and less expressive features. They are considered as the aborigines of these highlands. The Toderies are herdsmen, wandering from pasture to pasture, and they and the Koties always go bare-footed and bare-headed. The Nairs in Malabar form a singular caste, from their peculiar manners and customs. Pretending to be soldiers by birth, they disdain all industry; and are often seen parading up and down fully armed, each man with a firelock, and with at least one if not two sabres, which they more frequently use in secret assassination than in open war. Amongst the Nairs marriage is a mere form, and both sexes indulge in a promiscuous intercourse. The women are married before they are ten years of age; but the husband never cohabits with his wife. He allows her a suitable maintenance, whilst she lives with her brothers, and cohabits indiscriminately with any person of an equal or higher rank. Owing to this irregular intercourse, no Nair knows his own father; and every man considers his sister's children as his heirs."[1] The Nestorian Christians are numerous in the S. of India, and are a peaceful and industrious race. The Roman Catholics, the descendants of the Portuguese, French, Dutch, and other Europeans or converts to their faith, are sunk in idolatry not much superior to that of the Hindus. The foreign races in India are the mercenary Arabs, who are brave soldiers, ready to fight on any side for good pay; and the Chinese, who are fast increasing in Calcutta; their number, according to the last census of that city, amounting to nearly 1000. Another race has sprung up in India since the country was occupied by the British, who are known by the various names of Europeans, Anglo-Indians, Indo-Britons, half-castes, and the like, but who have now assumed the appellation of East Indians. They are the descendants of Europeans, either British or others, by native mothers, legitimate and illegitimate. They speak the English language, and follow all the European habits, and the Protestant religion. The number residing in Calcutta in 1850 was 4615. These are subject to the law administered by the crown judges in the Queen's court at Calcutta, but beyond the limits of the jurisdiction of this court, East Indians are amenable to the judicial courts, over which the Company's civil servants preside. In these courts the judge has not the power of life and death, but he is competent to sentence to long terms of imprisonment. All capital cases are referred for the disposal of the Nizamut Adawlut, the highest of the Company's courts in India. East Indians and others not professing the Mohammedan faith, are not tried under the provisions of the Mohammedan criminal law, but under regulations passed by the Government of India, the judge being assisted by assessors or by a jury, but having power to overrule their opinion. In the year 1793 East Indians were excluded by express enactments from the civil and military service of the Company, and were only eligible to subordinate situations in public offices; though of late years this exclusion was only applied in its rigour to the immediate descendants of European and Indian parents, all others being eligible to civil and military offices. Prior to 1793, the East Indians were freely admitted into the army, and several of them attained to the rank of generals and colonels, and commanded large bodies of troops with efficiency and success. Notwithstanding the restrictive law, there were still examples of their admission into the Company's service. Those who are not engaged in the public service follow other professions. Some have acquired high reputation and large fortunes by medical practice. Others are employed as planters, schoolmasters, architects, printers, carvers and gilders, or engaged in commerce. The laws passed in 1833 and 1853 for regulating the Company's affairs, abolish these unjust and illiberal distinctions, and render every class, of whatever caste or religion, eligible to all offices civil and military.[2]

[1] *Annals of Rajast'han*, vol. i. chap. 3.

[2] For a more full account of some of these tribes, see the article on GUJERAT, a province in which they abound.

Such are some of the principal tribes who inhabit the low country of Central and Northern India, "whilst the mountains and woods, wherever they occur, show specimens of a race entirely different from all these, and in a state of society scarcely elevated above the savages of New Holland or New Zealand." It is finely observed by Sir John Malcolm in his *History of Persia*, that, in the conquest of a country, the rocks and the mountains often afford a last asylum to the brave and the free; and accordingly, many of the native tribes in Hindustan, flying from the destroying sword, have thus maintained for ages a savage independence, and all the distinct traces of an original race. The elevated tract in Bengal, reaching from Rajamahal to Burdwan, is inhabited by several tribes of mountaineers, and amongst them the barbarous Santals, who are probably the aborigines of the country; and, from their features, language, civilization, and religion, are obviously of a different stock from those in the plains. Amongst the Puharrees, who inhabit this tract, the Hindu institution of castes is unknown; the Hindu deities are equally so; and they have no idols, being nearly in the condition of savages. They subsist by the chase, their arms are bows and arrows, and they are nearly naked. They formerly waged incessant war with the cultivators of the plains, whom they robbed and murdered, and were in their turn hunted by the Mohammedan zemindars like wild beasts. Having been kindly treated and conciliated by the British, they are so far reclaimed from their wild habits, that a battalion of sepoys has been raised from amongst them. The peculiar features of the rude tribes in the eastern hills of Bengal, and the adjacent plains, equally indicate a distinct origin. The Kookies, who live in the mountains to the N.E. of the Chittagong district, have all the peculiar features of a Tartar countenance; the flat nose, the small eyes, and the broad round face. They are stout and muscular, though not tall; and they are hunters and warriors, armed with bows and arrows, clubs and spears. They live in the most inaccessible hills, in a state of constant warfare, and, like all savages, are cruel and vindictive.

Religion.

The inhabitants of Hindustan rank much lower in the scale of civilization than the nations of Europe. They are far behind them in literature, science, and the arts, and in all the civil institutions of society; and their religion is that of a rude people, consisting in an endless detail of troublesome ceremonies, which are deeply interwoven with the whole system of life. The reason of man, in contemplating the wonders of creation, is directed by the light of nature to one great First Cause; and in the structure of the universe are clearly seen the divine attributes of goodness, wisdom, and almighty power. Accordingly, Brahm, or God, is declared, in many passages of the Vedas or sacred writings of the Hindus, to be the almighty, infinite, eternal, self-existent being, who sees all things, and is everywhere present; the creator and lord of the universe, its preserver and its destroyer, who can neither be described nor adequately conceived by the limited faculties of man. But with these simple conceptions of the divine majesty other grosser ideas are combined, and a system of polytheism, accompanied by the most extravagant and obscene fables, and all the disgusting, cruel, and blood-thirsty rites of an abominable idolatry. Whilst Brahm, the Supreme Being, is supposed to remain in holy obscurity, he has distributed respectively to three other deities, Brahma, Vishnu, and Siva, the power of creating, preserving, and destroying the world. But it does not appear that these deities are strictly confined to their separate functions; Vishnu, the preserver, frequently employing himself in acts of destruction; and Siva, on the other hand, in acts of beneficence. In short, the Hindu creed presents no clear nor determinate ideas. All is vague, inaccurate, and confused. Brahma, the creator, is represented as a golden-coloured figure, with four heads and four arms. Vishnu, the preserver, is represented of a black or blue colour, with four arms, and a club to punish the wicked. The emblems under which he is represented refer to his vindictive character. He has three eyes, to denote the three divisions of time past, present, and future. A crescent in his forehead refers to the measuring of time by the lunar revolutions, as a serpent denotes it by years; and the necklace of skulls which he wears, the extinction of mankind in successive generations. The great ends of his providence are brought about by various incarnations of the Hindu deity. Of these visible appearances, denominated avatars in the Hindu mythology, there are ten, of which nine have already taken place; and although the Hindu account of what took place at these times is a tissue of absurdity, extravagance, and indecency, yet we may trace, under a mass of fable, the Scripture account of the deluge, with various other points of the Christian theology. But the history of the creation from a seed deposited in the waters, which became an egg, from which Brahma the creator was born, is in the highest degree absurd and profane. At the tenth avatar, which is yet to come, Vishnu, as is foretold, will appear on a white horse, with a scimitar blazing like a comet, for the everlasting punishment of the wicked who shall then be on the earth. Each earthly incarnation of the divinity gives rise to a new deity; and there are, besides, innumerable other minor deities, amounting, it is said, to 330 millions. All the great elements of nature are deified by the extravagant superstition of the Hindus; also the firmament of heaven, the sun, moon, and stars; every river, fountain, and stream, is either a deity in itself or has a divinity presiding over it, nothing being done without some supernatural agency; and there are, besides, innumerable myriads of demigods, to whose honour idols are erected and worshipped by all classes with much apparent devotion. Stocks and stones, or a lump of clay smeared over with a little red paint, are converted into a god, and reverenced, by the ignorant Hindu. Any figure, either of brute or man, or any monstrous combination of both, with a multiplicity of heads and hands, mark a Brahminical place of worship. In the lapse of ages, great changes have been introduced into the religious practices of the Hindus; and sectaries have arisen amongst them, each with peculiar objects of adoration and modes of worship. Five great sects worship exclusively a single deity; one recognises the five divinities that are respectively reverenced by the other sects, but they select one object for daily adoration, whilst they perform only occasional rites to the other deities. The Vedas, or the Hindu Scriptures, were revealed before the appearance of Buddha, the ninth incarnation of Vishnu, which is supposed to have taken place in the year 1014 before the Christian era. He appears to have borrowed his theology from the system of Capila, in which the unlawfulness of killing animals is inculcated as an essential point. But the overthrow of the Buddhists did not revive the religious system inculcated in the Vedas. The doctrines taught in these sacred books are now mostly obsolete, and in their stead new forms and ceremonies have been instituted, and new orders of devotees. In particular the goddess Kali, the consort of Siva, who delights in blood, has been propitiated by the sacrifice of animals; and the worship of Rama and Krishna, incarnations of Vishnu, and of Siva the destroyer, appears to have been introduced since the persecution of the Buddhists and Jains.

[2] Minutes of Evidence before Select Committee on the Affairs of the East India Company, on a Petition of certain Christian Inhabitants of Calcutta, &c., presented to the House of Commons on the 4th May last. (21st June 1831.)

The worshippers of Buddha, though they believe in the incarnation of Vishnu, are regarded as heretical by the Hindus, and have been compelled, by persecution, to fly to other countries. They have now propagated their faith over the greater part of Eastern India, in China, and as far as Japan; also in Thibet and Ceylon. The Jains are another sect of Hindus, who acknowledge only as subordinate deities some, if not all, of the gods of the Brahmins, and the prevailing sects; and assign the highest place to certain deified saints, who, according to their creed, have risen to the dignity of superior gods. They neither address prayers nor perform sacrifices to the sun or the fire; and they reject the authority of the Vedas, as do also the Buddhists. The presence of umbrella-covered pyramids, or semi-globes, and of plain human figures sitting cross-legged, or standing in an attitude of contemplation, point out the temple or excavation of a Buddhist. The twenty-four saintly figures, without the pyramid, indicate a Jain temple.

The sacred books of the Hindus, though they inculcate generally all the moral duties of justice, mercy, and benevolence, yet seem, like every other system of false religion, to give the first place to the ceremonial law; and accordingly the devotion of the Hindus consists in mere outward observances, and is not inconsistent with the most scandalous crimes. Under the Christian system, there can be no piety to God without benevolence to man. But the troublesome ceremonies of the Hindu religion encroach, not only on all moral duties, but on the whole business of life; and confer such a stock of atoning merit that they seem to supersede the weightier matters of the law. The observances which are imposed upon a Brahmin commence when he rises in the morning, and consist in divers ablutions and prayers, in the worship of the rising sun, in the inaudible recitation of the gayatri, or the holiest text of the Vedas, in holy meditation, and in other ceremonies. He has then to perform the five sacraments, which consist in teaching and studying the scriptures, which is the sacrament of the Veda; in offering cakes and water, which is the sacrament of the manes; in an oblation of fire, the sacrament of the deities; in giving rice and other food to living creatures, which is the sacrament of spirits; and in receiving guests with honour, which is the sacrament of men. The whole day would not suffice for the punctual performance of these ceremonies; and they are of necessity abridged, to give time for the proper business of life. In almost all the religious traditions of the world we find traces of the Scripture revelation, however corrupted; and the Hindu system seems to have borrowed, and to have greatly extended, the typical impurities of the Mosaic law. The rules on this subject, pointing out the causes of defilement, and the modes of purification, are numerous, many of them to the last degree absurd and troublesome. The death or the birth of a child renders all the kindred unclean. Any one who touches a dead body, a new-born child, an outcast, &c. is unclean; or a Brahmin who has touched a human bone. The natural functions of the body give occasion to many minute and disgusting regulations; and the modes of purification are equally strange and ridiculous. Of these, bathing is the most rational; the other modes are by stroking a cow, looking at the sun, or having the mouth sprinkled with water. He who is bitten by any animal frequenting a town, or by a mare, a camel, or a bear, is unclean; and he is purified by stopping his breath during one inaudible repetition of the gayatri. Inanimate substances may also be unclean, and the various modes of purifying them rival in absurdity the other extravagances of the Hindu code of religious observances.

The expiation of sin by voluntary penance is another favourite doctrine of the Brahmins, by which they contrive to awe superstitious minds into subjection; and in their estimate of offences, with a view to suitable penances, they subvert all moral distinctions. "Acts naturally indifferent," says the author of *Indian Recreations*, "are put on the same footing with immoralities; eating certain articles of food, drinking certain liquors, or touching certain objects, are declared forfeitures, and are expiated by penance as immoral conduct. Forgetting texts of scripture is classed with perjury; eating things forbidden, with killing a friend; incest and adultery are compared to slaying a bull or a cow; drinking forbidden liquor, to killing a Brahmin. In several instances, actions highly meritorious according to our notions, are put on the same footing with a conduct implying great infamy. Working in mines of any sort, engaging in dykes, bridges, or other great mechanical works, is classed with subsisting by the harlotry of a wife, and preparing charms to destroy the innocent."[1] To these artificial offences, penances are either affixed by the Brahmins, or are voluntarily undertaken by their pious votaries; and these generally consist in fasts, mortifications, watchings, and other bodily privations. "If a Brahmin," says Menu, "have killed a man of the sacerdotal class without malice, he must make a hut in a forest, and dwell in it twelve whole years, subsisting on alms, for the purification of his soul. If the slayer be a king, he may perform sacrifices, with presents of great value; if a person of wealth has committed this offence, he may give all his property to some Brahmin learned in the Veda." In some cases the penances consist in eating what is filthy and disgusting. If a Brahmin kill by design a cat, or an ichneumon, the bird chisha, or a frog, a dog, a lizard, an owl, or a crow, he must perform the ordinary penance required for the death of a Sudra, one of the lowest caste, who are thus no more valued than a cat or a frog. A particular class of devotees, namely, the Fakirs, signalize their piety by enduring the severest tortures, and with a constancy worthy of a better cause. Bishop Heber describes, with his usual force, the appearance of these eastern monks as he entered the holy city of Benares. "Fakirs' houses," he observes, "as they are called, occur at every turn, adorned with idols, and sending forth an unceasing tinkling and strumming of vinas, byyals, and other discordant instruments; while religious mendicants of every Hindu sect, offering every conceivable deformity which chalk, cow-dung, disease, matted locks, distorted limbs, and disgusting and hideous attitudes of penance, can show, literally line the principal streets on both sides. Here," he adds, "I saw repeated instances of that penance of which I heard much in Europe, of men with their legs and arms voluntarily distorted by keeping them in one position, and their hands clenched till the nails grew out at the backs. Their pitiful exclamations as we passed, '*Agha Sahib, Topee Sahib*,' the usual names in Hindustan for an European, '*khana ke waste kooch cheez do*,' give me something to eat, soon drew from me the few pence I had; but it was a drop of water in the ocean; and the importunities of the rest, as we advanced into the city, were almost drowned in the hubbub which surrounded us."[2] The tortures which these fanatics endure exceed all belief. A penitent who went through the ceremony of sitting between five fires, is described by Fraser, who witnessed the penance at a public festival. Being seated on a quadrangular stage, after the sun began to have considerable power, he stood on one leg gazing stedfastly at its scorching beams, whilst fires large enough, says the traveller, to roast an ox were burning around him, the penitent counting his beads, and occasionally adding fuel to the flames. He stood upright on his head in the midst of these fires for three hours; and then seating himself with his legs across, he remained till the end of the day exposed to the scorching heat of both the sun and the fires.[3] Other cruel and bloody rites are contrived by those devotees, the worshippers of Siva or his consort the goddess Kali. At one of the festivals in honour of this goddess, Bishop Heber, who was present, relates, that one of these self-tormentors had hooks thrust through the muscles of his sides, which he endured without shrinking, and a broad bandage being fastened round his waist to prevent the hooks from being torn through the flesh by the weight of his body, he was fastened to a long pole, and, by means of another pole fixed in the ground, he was swung aloft and whirled round in the air; on a motion being made to take him down, he made signs for them to proceed, a mark of constancy received with shouts of applause by the ignorant multitude. Other devotees were seen going about with small spears thrust through their tongues and arms, or with hot irons pressed against their sides. Bishop Heber saw another of these penitents who was actually half roasting himself by a fire which he had kindled in a hole dug in the ground; another was seen hopping on one foot, having made a vow never to use the other, which was now contracted and shrunk up; and a third had held his hands above his head so long that he had lost the power of bringing them down to his sides. Some are seen buried up to the neck in the ground, or even deeper, with only a small hole for breathing. Some lie on beds of iron spikes, or tear their flesh with whips, or chain themselves for life to the foot of a tree, or remain in a standing posture for years, till their legs swell, and break out into ulcers, and become at last too weak to support them; others exhaust their bodily strength with long fasting, or gaze on the blazing sun, till their eyesight is extinguished. These devotees subsist entirely by charity; and Dr Buchanan mentions a class of them in the south of India, who wander about with bells tied to their legs and arms, in order to give notice of their presence as they approach the villages.[4] They are always naked, and filthy in the extreme, being covered with cow-dung and chalk; and for the tortures which they endure in public they indemnify themselves in private by the utmost license of sensual indulgence.[5] Amongst other observances, the Hindus have always been much given to religious pilgrimages; and their holy places have been generally established near the sea, the sources and junctions of rivers, which are held in peculiar veneration, the tops of remarkable hills, hot springs, caves, waterfalls, or any other place of difficult or dangerous access. A pilgrimage to Gangoutri, near the sources of the Ganges, is accounted the great achievement of Hindu piety. To the waters of this river the superstitious Hindu ascribes peculiar sanctity, and devoutly worships it throughout its whole course. But there are particular spots more sacred than others; and so great is the resort of pilgrims, and such their ardour to wash in the sacred stream, that numbers, in the crush and tumult, are hurried into the water and drowned, or trodden to death in the crowd.

It is not doubted that, at a period not very remote, the bloody deities of the Hindus were propitiated with human sacrifices, and some of the rites still in use amongst them confirm this suspicion. In some of the native states the Brahmins, in resisting oppressive demands, resort to a contrivance, in which a human victim is really sacrificed. They erect a circular pile of wood, on the top of which they place a cow or an old woman; and if the demand is insisted on, they set fire to the pile, and consume the sacrifice, which is supposed to entail on the oppressor the deepest guilt. Bishop Heber gives, in his narrative, an example of the sacrifice of an old woman, who, in a quarrel which her husband had with his neighbour respecting some land, was thrust into a Mahbout's hut, and there burned, in order that her spirit might haunt the spot, and entail a curse upon the soil. Children were also formerly sacrificed, by throwing them to the sacred sharks of the Ganges, till the practice was forbidden by the British government; and a voluntary sacrifice of themselves by individuals, in honour of the gods, is still reckoned meritorious. At the festival of Juggernaut, the idol is placed on a ponderous machine or chariot, and dragged forward by a crowd of devotees and priests, when numbers of the people, even fathers and mothers, with their children in their arms, throwing themselves in the way of the chariot, and being crushed to death under its ponderous wheels, amidst the fanatical cries of the multitude, are supposed to be conveyed immediately to heaven. Numerous victims of both sexes drown themselves annually at the junction of the sacred streams;[1] many strike off their own heads as a sacrifice to the Ganges, whilst others expiate their sins by casting themselves into the avenging flames. This act of devotion is accompanied by atrocities that are truly shocking, the devotee previously laying open his bowels with the stroke of a sabre, tearing out his liver and giving it to a byestander, conversing all the time with apparent indifference.[2] Many other enormities are practised at the festivals in honour of their gods, which it would be endless and disgusting to detail. The custom of a widow burning herself on the funeral pile of her husband is a noted rite of the Hindu religion, but the practice has been for some time abolished within the British territories, and more recently several of the native princes of India have been also prevailed upon to prohibit the rite of Suttee within their respective dominions. The Hindus in this, as in many other instances, evince a singular indifference about their own lives; which also appears in the frequent instances of suicide amongst them. "Men," says Heber, "and still more women, throw themselves down wells, or drink poison, for apparently the slightest reasons, generally out of some quarrel, and in order that their blood may be at their enemy's door." Obscenities mingle with these bloody rites, and the most indecent figures are pourtrayed on the chariots used at the temples, many of them large and richly carved. "These," says Dr Buchanan, "representing the amours of the god Krishna, are the most indecent that I have ever seen."[3] Equally indecent representations are carved on the sacred cars fixed at the temples, in which the musicians and dancing girls are all prostitutes to the Brahmins, and turned out to starve when they grow old, unless they have a handsome daughter to support them from the wages of iniquity. The state of morals among the Hindus is such as might be expected from a religion so impure, and from the gross emblems which are used on sacred occasions; their writings and their conversation are shocking to European ears; and even the Hindu women hear without a blush and join in language the most gross and disgusting. They are sensual in all their ideas, and pursue the intercourse of the sexes with little more discrimination than the brute creation. Fidelity to marriage vows is scarcely known amongst them, at least amongst the men.

A superstitious tenderness for the brute creation is a peculiar tenet of the Hindu creed, which prohibits the use of animal food excepting at the great festivals, when the sacrifices of beasts propitiate the bloody deities, and serve the natives for a feast.[4] But the same abstinence from animal food is not general throughout Hindustan. In the north of India it has already been mentioned that it is freely used by the inhabitants; and, according to Dr Buchanan, there are castes in the south of India who eat sheep, goats, hogs, fowls, and fish, though there are others who religiously abstain from these, and from all spirituous liquors.[5] Several animals, as the cow and the monkey, are objects of veneration. Bishop Heber, so often quoted, mentions, that on entering the holy city of Benares, "the sacred bulls devoted to Siva, of every age, tame and familiar as mastiffs, walk lazily up and down the narrow streets, or are seen lying across them, and hardly to be kicked up; any blows, indeed, given them must be of the gentlest kind, or woe be to the profane wretch who braves the prejudices of a fanatic population, in order to make way for the tonjon. Monkies, sacred to Hunimaum, the divine ape, who conquered Ceylon for Rama, are, in some parts of the town, equally numerous, clinging to all the roofs and little projections of the temples, putting their impertinent heads and hands into every fruiterer's or confectioner's shop, and snatching the food from the children at their meals."[6] To such a length is this superstition carried, that they have established an hospital for sick and infirm beasts, and for fleas, lice, and insects, though it does not appear, as reported by some travellers, that they feed these loathsome creatures on the flesh of beggars hired to lodge in the hospital for that purpose. An hospital for animals is to be seen at Broach in Gujerat, which has considerable endowments in land, and in which, are monkies, peacocks, horses, dogs, cats, and little boxes filled with fleas and lice. This hospital was described to Bishop Heber by the British commercial agent resident at Broach. The funds, however, are said to be alienated by the avaricious Brahmins, and the animals allowed to starve. With all this veneration for animals, they are nowhere more cruelly treated. They are overworked and abused in a manner shocking to a European. "They treat their draft horses," says Bishop Heber, "with a degree of barbarous severity which would turn an English hackney coachman sick;" nor do they show any greater sympathy for human beings, who are allowed to perish before their eyes from hunger or disease. Lepers, according to their base and irrational superstition, are treated as objects of the divine wrath; they are cruelly neglected, and regarded with abhorrence rather than with sympathy.

The transmigration of souls is another favourite tenet of the Brahmin superstition. The souls of good men migrate in the next world into hermits, religious mendicants, Brahmins, demi-gods, genii, or other celebrated intelligences; and the best ascend to the condition of Brahma with four faces. The next gradation allotted to souls filled with passion is into men and not into deities, into cudgel players, boxers, wrestlers, actors, or those of a higher class into the bodies of kings, and the highest become genii, attendants on the superior gods; whilst souls filled with darkness are degraded into the lower animals, such as worms, reptiles, cattle, &c. or into elephants, horses, Sudras (the lowest caste), or into the still more degraded class of men of no caste, or into lions, tigers, &c.; to the highest are allotted the forms of dancers, singers, &c. birds, giants, blood-thirsty savages. Particular migrations are assigned as the punishment of certain enormities; but it is useless to pursue the system further into its absurd and disgusting details.

Manners. The religion of Hindustan is so closely interwoven with its customs, manners, and laws, that they can scarcely be described separately. The division of a Hindu community into castes is an institution, not of policy, but of religion, which embraces the whole detail and intercourse of life. There are four original or pure castes, namely, 1*st*, the Brahmins, or priests; 2*d*, the Cshatriyas, or military caste; 3*d*, the Vaisyas, or husbandmen; and, 4*th*, the Sudras, or labourers. Of these the Brahmins are declared to hold the first rank, and to be the lords of all the other classes. A want of due reverence to them, especially by the lowest or the Sudra class, is accounted one of the most atrocious crimes. The laws and manners equally concur to maintain the honour, and all the substantial privileges, of this sacred order. They are exempted from taxation, and from the sanguinary laws which affect the other classes. Neither the life nor property of a Brahmin can be touched, even though he commit the most atrocious crimes; and the whole scope of the Hindu religion is to heap gifts and wealth upon them. "Every offence," says Orme, "is capable of being expiated by largesses to the Brahmins, prescribed by themselves, according to their own measures of avarice and sensuality."[1] The duties of the Brahmins are to meditate on divine things, to read the Vedas, to instruct the young Brahmins, and to perform sacrifices and other religious acts. The Cshatriyas, or the military rank, is next in order to that of the Brahmins. Their duty is to bear arms in defence of the state, and they rank as high above the lower orders as the Brahmins do above them. The Vaisyas, the third caste of Hindus, tend cattle, or engage in trade and agriculture. They rank only above the Sudras, from whom, however, they receive the same deference and submission which they give to the higher castes. To the Sudra, or the lowest class, are allotted all the meanest and most servile duties; they are regarded with abhorrence by the other tribes, to whom religion prescribes their most abject submission, as well as every other species of degradation. They are in a manner excluded from the privileges of the social state. They pay a higher rate of interest for money than any of the other classes, they are more cruelly punished for crimes committed against them, whilst an injury to a degraded Sudra is a light and venial offence. They are held to be in a state of slavery, they cannot possess property, and at any time a Brahmin may seize the goods of his Sudra slave. So degraded are they, that under this gloomy, unsocial superstition, a Brahmin cannot lawfully read the Veda in presence of any of them, nor give them spiritual counsel or instruction, under pain of sinking with them into hell. To each of these classes, into which society is divided, are assigned, under the severest penalties, particular and hereditary employments. But the rigid severity of this law is softened by the following exceptions. A Brahmin who cannot find employment in his own spiritual line, may descend to the exercise of military duties, or to tillage and attendance on cattle, or to traffic, only avoiding certain commodities. In like manner, a Cshatriya in distress may have recourse to all inferior employments, though not to the higher duties of the Brahmins. The practice of medicine and other learned professions, of painting and other arts, common labour, menial service, begging, or serving, may be resorted to upon the plea of necessity. A Vaisya may descend to the servile work of a Sudra; and a Sudra may subsist by handicrafts, as joinery, masonry, painting, and writing, by which he may serve the higher classes; or by trade or husbandry. The loss of caste is one of the most serious calamities which can befall a Hindu, and may in fact be compared to the spiritual anathemas of the Catholic church during the dark ages of Europe. If the loss of caste were the penalty of immorality, the fear of it would impose a salutary restraint. But this is far from being the case. The most abandoned Brahmin retains his rank, notwithstanding his crimes; but he will entirely forfeit it and lose all countenance in society by touching impure food, or by some such petty delinquency. To sit down at a meal with one of an inferior caste, would be deemed a monstrous pollution; and a naked Hindu would think himself defiled by the presence of the first monarch of Europe at any of his meals. "While dinner is preparing," says Tennant, "and during eating, a small circle is drawn round the company, which an European, if he pass, infallibly defiles the meal; it is thrown to the dogs, and other victuals provided, though a single one be all the treasure of the family."[2]

Such may be considered as in theory the structure of a Hindu community. But since, in the progress of society, this strict division into classes with distinct employments could not long be maintained, we accordingly find that, by illicit connexions, the pure races are intermixed, and children born who, being of no caste, are therefore impure, and objects of execration to all the other tribes. This impure race, denominated the Burren Sunker, and classified into distinct tribes, have become artisans and handicraftsmen of every description. From the intermixture of these various races innumerable mixed tribes have sprung, and the pure blood of the four original tribes is scarcely to be found; so that Mr Rickards, in his accurate account of Indian manners, says, "I have never met with a person who could prove himself a genuine Cshatriya, Vaisya, or Sudra; whilst of those who pretend to be of pure descent, Brahmins and other respectable and intelligent Hindus have assured me that they have no right to the distinction; that the genuine tribes above named are extinct, and their descendants in this generation all of mixed blood. If, however, any do now exist, they must be too thinly scattered to affect the general interests of society by their privileges or numbers. "A real Cshatriya prince," he adds, "is not to be found in these days; all the greater princes of India, excepting the peshwa, a Brahmin, are base-born."[3] Nor, amidst this confusion of ranks, has it been possible to adhere to the strict allotment of certain employments to particular castes. The Brahmins no doubt still form a distinct order; their privileges are willingly conceded to them by the superstitious multitude, and the inferior castes have never encroached on their holy functions. But those of the other castes have been confounded. War has not been the exclusive employment of the Cshatriya caste; for the Indian armies are recruited from all denominations and castes. Nor have the Vaisya and the Sudra castes been more successful in the monopoly of their employments; seeing that all the various castes follow their allotted duties, and fill every branch of agriculture, commerce, handicraft, and menial service.[4] But the institution of castes, though it has not been strictly acted upon, being at variance with the fixed order of human society, has nevertheless deeply affected the aspect and structure of the Hindu communities; and whilst it exalts the order of priests, it degrades the lower classes to the level of the brutes. It is the source of cruel and anti-social prejudices, entirely opposite to those Christian feelings of benevolence by which man is bound to his fellow men; and by which the different orders of society, instead of being harshly separated, are softened and blended, as in the communities of Europe, into one harmonious whole.

[4] *Ibid.* p. 30.

Besides these degraded castes, whose condition is little better than that of slaves, numbers of unfortunate persons were until very recently reduced to actual slavery throughout India.[1] All the jaghiredars, zemindars, principal Brahmins, and talookdars employed domestic slaves in their establishment; and in every Mahratta household of consequence they were considered as indispensable. They were also employed in the labours of the field, in the cultivation of rice, and were in the lowest state of degradation, ill-fed and worse clothed, and most wretched in their appearance. But the British parliament, in legislating in the year 1833 for the better government of India, made it incumbent upon the governor-general in council to take into immediate consideration the means of mitigating the state of slavery, and of ameliorating the condition of slaves; and of extinguishing slavery throughout the territories subject to their jurisdiction so soon as such extinction should be practicable and safe. The result was the passing of a legislative act by the government of India, which, by refusing to recognise the right to property in slaves, and by extending protection to both the persons and property of parties so styled, has substantially put an end to the institution of slavery within the territories under the government of the East India Company. The British Government has also strenuously laboured to procure the abolition of slavery in the native states of India, and its efforts have been generally successful. In Travancore it still exists, and the slaves are described as in the lowest possible state of degradation. Not only are they held by private persons, but some are the property of the government, which derives a small revenue from letting out their services to such cultivators as require them. The British resident has pressed upon the minister the manumission of the children of these slaves; in addition to which the home authorities have suggested the emancipation of the parents also; and the subject of prædial slavery generally, with a view to its entire abolition at an early period, has been recommended to especial attention. In consequence of this pressure a proclamation was issued in 1853, declaring free the children of slaves of the state who may be subsequently born; forbidding the seizure of private slaves in satisfaction of debts; recognising the rights of slaves to possess property and to enjoy the protection of the law; directing the emancipation of slaves connected with property lapsing to the state, and prescribing regulations intended to preserve that unhappy class from oppression. How far these rules will be effective against the opposition of both prince and people remains to be seen; but it is something to have obtained a recognition of the right of slaves to be dealt with as human beings.

The Hindus are by no means a moral people. Notwithstanding the gentleness and feminine softness of their manners and address, they frequently commit the most revolting acts of cruelty. The practice of murdering children for the sake of the silver ornaments in which, by the vanity of their parents, they are attired, is common among them; and the gang-robbers of India are noted for the horrible tortures which they inflict on their unhappy victims, in their eager search after their hidden treasures. "Pestilence, or beasts of prey," says Dr Buchanan, "are gentle in comparison of Hindu robbers." According to the observation of Orme, the politics of Hindustan would afford in a century more frequent examples of sanguinary cruelty than the whole history of Europe since the reign of Charlemagne. "How many princes," observes this writer, "have been stabbed in full durbar" (in open court). "How many have been poisoned in their beds. Chiefs of armies circumvented and cut off at conferences in the field. Favourite courtiers strangled, without previous notice of their crime, or while they thought themselves on the eve of destroying their masters."[2] Murders amongst the Hindus, even by poison, excite no feeling of deep abhorrence, as among the nations of Europe; and the cold-blooded villany of the Hindu is often remarkable. Mr Holwell mentions, that when he sat as judge at Calcutta, he had heard it stated in defence of the most atrocious murders, that it was the Cali age, when men were destined to be wicked.[3] The Hindus, like all the other Asiatics, are great masters of dissimulation; they are cunning and treacherous, addicted to falsehood to a degree that can scarcely be conceived by a more refined and moral people. Perjury in courts of justice is universal, amongst high as well as low, and amongst both the Hindus and Mussulmans, without the least remorse or shame. The Europeans in the office of judges in India complain of being perplexed by a host of perjurers on each side, swearing in the teeth of one another. They are acute dissemblers in all affairs of interest, and are the sharpest buyers and sellers in the world, maintaining through all their bargains a degree of calmness which no art can penetrate.[1] A want of sympathy with the sufferings of his fellow-creatures is another trait of the Hindu character, and a sure index to the low state of refinement amongst them. They treat their sick and dying with indifference, and in many cases with shocking inhumanity. The sick whose life is despaired of are carried to the banks of the Ganges, and their mouth, nose, and ears are closely stopped up with mud; water is then poured upon them from large vessels, and thus, amidst the agonies of disease and of suffocation, life terminates. The corpse is then burned, if the survivors can pay the expense, and the relatives retire with every appearance of insensibility.[2] The effeminacy of their persons, and their timidity, prevent them from fighting or boxing in their quarrels. But this forbearance seems to proceed from no want of malignity or passion, as, in the event of any misunderstanding between two persons meeting accidentally in the street, they upbraid each other with the foulest epithets, accompanied by the utmost violence of gesticulation.

[1] See Papers relative to slavery in India; Return to the House of Commons, 6th March 1834; Evidence of Joseph Fenn, nine years a missionary in Travancore; Answers to Questions on Slavery, circulated by the Commissioners for the affairs of India; Evidence of T. H. Baber, Esq. thirty-two years resident in India; of the Honourable J. Harris, principal collector in Canara; and of Mr Warden, collector in Malabar. The evidence of T. H. Baber discloses a regular and shameful traffic in slaves, carried on by Mr Brown, a servant of the Company, and under the authority of the Bombay government. "How or whence," he observes, "this oppressive and cruel practice, not only of selling slaves off the estate where born and bred, but actually of separating husbands and wives, parents and children, and thus severing all the nearest and dearest associations and ties of our common nature, originated, it would be difficult to say; but I have no doubt, and never had in my own mind, that it has derived support, if not its origin, from the impolitic measure in 1798, of giving authority to the late Mr Murdoch Brown, while overseer of the Company's plantations in Malabar, from the difficulties he experienced, even with 'the assistance of the tchsildar' (the head native authority) and 'his peons' (armed persons with badges of office), to procure workmen, and 'of the price of labour being more than he was authorized to give,' to purchase indiscriminately as many slaves as he might require to enable him to carry on the works of that plantation; and of actually issuing orders to the European, as well as to the native local authorities, to assist him, and even to restore slaves who had run away and returned to their homes (without any orders to inquire the reason of their absconding), and who, as has been actually ascertained from the surviving slaves themselves, had been actually kidnapped by the doragha (head police officer), and sent up to North Malabar, to Mr Brown, which person had continued up to 1811, or for a period of twelve years, under this alleged authority, granted by the Bombay government, to import slaves and free-born children from Travancore, when, by the merest accident, this nefarious traffic came to my knowledge, and which, *after a considerable opposition on the part of the provincial court of circuit*, I succeeded in putting a stop to, after having restored to liberty and their country 123 persons who had been stolen, of whom 71 were actually found in Mr Brown's possession." Mr Brown's agent, Assen Ally, acknowledged, that during the time he was at Aleppi, at Travancore, in 1810, no less than 400 children had been transported to Malabar. The advocate-general's report alludes to "Mr Baber's perseverance in restoring the kidnapped children, in spite of very extraordinary opposition," and to the "extraordinary support Mr Brown appears to have received in these dealings in stolen children." (Fol. 788.) The still more objectionable practice of realizing the public dues by the seizure and sale of slaves off the land, must have confirmed proprietors in their idea of accounting the slaves their property. Mr Vaughan, collector, Malabar, in a letter dated 20th of July 1819, argues in favour of this inhuman practice, saying, "that the partial measure of declaring them not liable to be sold for arrears of revenue, will be a drop in the ocean; though, why government should give up the right every proprietor enjoys, is a question worthy of consideration." Par. 3, 4, 5, &c. Highest class slaves sold for 250 gold fananas, L.6. 5s.; average price, L.3. 6s.

[2] Orme's *Historical Fragments of the Mogul Empire*, p. 340.

[3] Mill, vol. i. p. 407.

Mr Rickards, in his valuable work upon India, seems to imagine that European writers have exaggerated the vices of the Hindus, and he exhibits them in a more favourable light. "Having lived," he observes, "twenty-three years in India, and passed much of that time in intimate intercourse with various natives, I have a different opinion of their character to that given in several printed works. I have constantly seen, in their acts and conduct, the practice of the most amiable virtues. I have experienced from many the most grateful attachment. I believe them capable of all the qualities that adorn the human mind; and though I allow many of their imputed faults (where is the individual or nation without them?) I must still ascribe these faults more to the despotisms under which they have so long groaned, and which unhappily we have but slenderly alleviated, than to natural depravity of disposition, or to any institutions peculiar to themselves."[3] No writer ascribes to the Hindus any greater natural depravity than other nations. But certainly their peculiar religion, its indecent and bloody rites, and the laws and usages founded on it, more especially the institution of castes, tend to extinguish in the breast all humane, enlightened, or moral feelings; and though, even amongst the Hindus, exceptions may be found, and the occasional practice of amiable virtues, yet the crimes which are proved to be committed openly and without shame or remorse sufficiently attest the want of morality, intelligence, and every humane and social feeling amongst them, and seem to place them in this respect entirely on a level with the other Asiatic nations. Ignorance is the parent of cruelty and vice, and with the progress of knowledge and of civil institutions certain crimes entirely disappear; and hence their existence amongst the Hindus bespeaks not so much any innate or peculiar depravity, as a low state of civilization, and a state of thraldom to a base superstition and to the dominion of priests, under which the social virtues are blighted in the bud, and selfishness and vice spring up in the congenial soil.

In every nation the condition of the female sex affords a sure index to the state of manners and the progress of civilization. Amongst savages, women are ill treated because they are weak and helpless, and there is no moral restraint on the tyranny of the men. In Hindustan, as over all the East, where polygamy prevails, they are a degraded caste, shut up in the harem or the seraglio, and not, as in Europe, the seat of a purer faith and more refined system of manners, the friends, the advisers, and equal companions, of their husbands. And both the laws and manners of the East lead to this unhappy effect. Whilst marriage is enjoined as a religious duty, not to be neglected except for the higher duty of becoming a devotee, the character of women is described in the Hindu books of law as stained with almost every vice. Pride, anger, envy, violence, deceit, falsehood, immoderate desires, infidelity to their husbands, and idleness, are pointed out as their ruling passions; and the treatment they meet with corresponds with those ideas. They are wholly uneducated, excluded from the sacred books, and from all knowledge of expiatory texts, and from any share in the paternal property; and they are held unworthy to eat with their husbands. They are the slaves of their domestic tyrants, and often receive the most barbarous treatment, being beaten and otherwise ill used; but they are not allowed to leave them, whilst the husband, on the other hand, may divorce his wife upon any plausible pretence. Such is the condition of women by the laws of Hindustan, which, we have no reason to believe, are softened in domestic life. Certain it is, that women, as long as they are uneducated, will be in a degraded state. It is only when they cultivate their minds that they can mix with advantage in society, and that, respecting themselves, and respected by others, they can acquire that ascendency to which they are entitled, and give, by the delicacy of their manners, that tone and polish to society which it cannot receive from the other sex.

The ceremonial of marriage is conducted amongst the Hindus with great solemnity and expense. The parties, who are of equal rank, and any other alliance would be accounted infamous, are betrothed during their infancy by their parents, but on a full consideration of their respective rank, skilful genealogists being consulted previously on this important point. These preliminaries being settled, the transaction terminates with an elegant feast; and when the wife comes of age she is conducted to her husband's home, with all due ceremony, and a concluding entertainment; another set of observances take place when she becomes pregnant, when she passes her seventh month, and when she is safely delivered. These festivals amongst the rich are extremely expensive.

The Hindus are ignorant and illiterate. The children of the poor seem to be mostly uneducated. Those in a higher station are taught by the Brahmins to read and write, and to cast accounts, the calculations being performed by pebbles or small shells. The pupil first begins to write upon the sand with his finger, and he afterwards uses palm leaves. After being thus initiated in the rudiments of literature, he enters on the course of his professional study, in which he has no choice, every one following the profession of his father. A student is instructed chiefly in the Vedas, and in the ceremonial of his religion; and his course of discipline in the three Vedas may be continued for thirty-six years, in the house of his preceptor, or for a half or quarter of that time, until he comprehend them. To the state of the student succeeds that of the married man or the housekeeper, when the youth begins to sustain his part in the business of life. He may, however, continue his whole life a pupil, waiting upon and serving his preceptor the Brahmin until his death. By this devotion to him he acquires a title to the highest rewards of religion. Of the common people, a few individuals only are taught to read or write. The great body of the people remain in ignorance. They can explain nothing of their own religious system, nor of the ceremonies which they attend. This gross and universal ignorance, whilst it is the parent of crime, exposes the Hindus to all the artifices of priestcraft, and of every quack who pretends to skill in any art or science whatever. The unbounded influence of the priests is highly inexpedient, and has in some instances been found dangerous to the public peace. On one memorable occasion, as related by Bishop Heber, this influence became a political engine, which was wielded with great effect, to the alarm of the local government. Among other superstitions of the Hindus, it is well known that they inflict evils on themselves or others, even to the sacrifice of their lives, under the idea that they will be avenged on their enemies. One of these practices is to sit "dhurna," or mourning, in a fixed posture, without food, and exposed to the weather, until the person against whom the religious rite is directed agrees to give redress. It is firmly believed, that if the person dies in this mourning state, his avenging spirit will ever afterwards haunt and torment him whose obstinacy may have occasioned his death. The Hindus resort to this practice in order to enforce payment of a debt, or forgiveness of one; and it is a notion amongst them, that whilst an aggrieved person sits at their door "dhurna," they can neither eat nor undertake any business. Brahmins are even sometimes hired to sit *dhurna*, and their sacred character is supposed to give a peculiar awe to the ceremony. It was in opposition to an unpopular and heavy tax on houses in the city of Benares, against which they had in vain remonstrated, that the whole population, far and near, resolved to sit "dhurna" till it was repealed. On this occasion the leading Brahmins took their measures with surprising concert and unanimity. Handbills were circulated explaining the causes and necessity of the measures, "calling on all lovers of their country and national creed to join in it, and commanding, under many bitter curses, every person who received it to forward it to his next neighbour. Accordingly," adds Bishop Heber, "it flew over the country like the fiery cross in the Lady of the Lake; and, three days after it was issued, and before government was in the least apprised of the plan, above 300,000 persons, as it is said, deserted their houses, shut up their shops, suspended the labour of their farms, forbore to light fires or dress victuals, many of them even to eat, and sat down with folded arms and drooping heads, like so many sheep, on the plain which surrounds Benares." There was every reason to dread some violent issue to such an extraordinary transaction. The local government, exceedingly perplexed by so strange and vast an assemblage, acted with consummate prudence; and this motley multitude being let alone, gradually dispersed. The rulers of India, thus admonished, were fain to repeal the obnoxious tax. The ignorance of the great body of the Hindus exposes them to impositions of every description. In the medical art, charms, incantations, exorcisms, and the shallowest tricks, are substituted for professional skill; and other impostors, generally Brahmins, practise astrology, and cheat them out of their money by pretended prophecies, from the aspect of the skies. The belief of sorcery and witchcraft is universally prevalent amongst them, and leads, as it formerly did in our own country, to cruel enormities. Persons suspected of witchcraft are the objects of fear and hatred; and their neighbours often assume the right of trying them for this crime, by charms and incantations, such as planting a branch of the saul tree in water, with the name of the suspected person, and if it wither within a certain time, the evidence against the accused is considered conclusive.

[1] Orme *On the Government and People of Industan*, p. 431.

[2] Rickards' *India*, p. 3.

[3] Tennant, *Indian Recreations*.

The Hindu is distinguished by the slenderness and delicacy of his corporeal frame, which is partly the cause of his peculiar timidity. His make, his physiognomy, and his small degree of muscular strength, convey a remarkable idea of effeminacy, especially when contrasted with the robust stature of a European who is making the observation. "The sailor," says Orme, "no sooner lands on the coast, than nature dictates to him the full result of this comparison. He brandishes his stick in sport, and puts fifty Indians to flight in a moment." The Indian, however, greatly surpasses the European in the sensibility of his touch, and in the flexibility of his limbs; and hence, with tools which would scarcely enable the clumsy fingers of the one to make a piece of canvass, he weaves the finest cambrics; and in all feats and contortions of the body, in the art of tumbling, and in juggling tricks, the Hindus excel all other nations. They are also patient of bodily fatigue, and in running or marching will distance more robust competitors. An Indian messenger will travel on foot fifty miles a day for twenty or thirty days without intermission. They are withal remarkable for bodily inertness, and the love of repose. "It is more happy," they say, "to be seated than to walk; it is more happy to sleep than to be awake; but the happiest of all is death." Their amusements are accordingly all of the sedentary kind. A game which resembles chess and draughts, though without either the variety or interest of the former, is one of their favourite amusements; and, like all rude nations, they are passionately fond of gaming, though it is contrary to the Gentoo code; also of feats of agility and legerdemain; and a juggler who erects a stage in any part of the East is sure to draw a crowd of spectators. Buffoonery, story-telling, music, consisting of simple melodies, and dancing, which they enjoy as spectators, complete the catalogue of Hindu amusements. Their extreme fondness for hunting forms an exception to their general indolence; all the different races in India, Europeans, Moguls, and Hindus, shaking off their natural supineness, are seen to concur in the ardour of the chase. Hawking is also keenly pursued by natives of distinction. Besides falconers, fowlers, and game-keepers, Hindus of rank employ persons to ensnare wild animals; and the contrivances they resort to are not less ingenious than successful.

Many have given credit to the Hindus for cleanly habits, from their frequent ablutions; but the reverse is the case. A taste for cleanliness is a proof of refinement; it is a sure mark of a highly civilized people; and accordingly it is not to be found in any part of Asia. Almost all the Asiatic cities are distinguished by narrow streets, into which, as there are no police regulations, all sorts of filth are indiscriminately thrown. The Hindus form no exception to this general censure. In all the great towns the streets are filthy. Nor are the Hindus more cleanly in their persons. Their linen, being dyed, is seldom washed; and, like the Chinese, they frequently allow their robes to drop off with filth before they think of changing them.

Government.

A simple and despotic monarchy is the only form of government which was established under the native princes of Hindustan; and it was a despotism in the true Asiatic sense of the word, under which neither laws nor manners restrained the excesses of absolute power. In the most despotic states of Europe, the authority of the monarch is controlled by the influence of manners, and life and property are perfectly secure. But this was far from being the case in India; the sovereign was supreme arbiter of the lives and properties of all his subjects. Nor was this power allowed to lie dormant; it was frequently enforced in cruel and arbitrary acts; and the annals of India are accordingly stained with the most revolting outrages of abused power. Wealth presented too tempting a prize to lawless violence; and its possessor, if he neglected to make large and seasonable presents, was sure to be accused of some pretended crime, thrown into a dungeon, and plundered. "Instead of giving him poison," says Orme, in his just estimate of the people and government of Hindustan, "which would not answer the end proposed, as his treasures are buried, he is beset with spies, who watch his minutest actions, and probably propose to him a commerce with the enemies of the province. If he avoid these snares, a profitable post in the government is proposed to him, which, if he accepts, his ruin is at hand, as the slightest of the villanies practised in every branch of it affords grounds for making him a public criminal. Should he have escaped this too, it remains that some more glaring and desperate measure of iniquitous justice hurry him to destruction." Mr Orme then proceeds to mention the case of a wealthy banking-house, the partners of which were personally known to him, who, having dexterously avoided all the snares laid for their property and life, were at length involved in an accusation by the accident of one of the dead bodies which are continually floating on the Ganges being thrown ashore under the walls of their house, on which it was surrounded by the officers of the civil magistrate, who dragged them to prison as the murderers of a son of Mahommed, and having ordered them to be severely scourged, extorted from them as the price of their liberty a present of 50,000 rupees. Another wealthy individual was forced to give in one present, to the nabob of Bengal, a sum equal to three hundred thousand pounds sterling.[1] Bishop Heber relates of the Rannee, or princess of Jeepoor, that she murdered a female attendant, a woman of character, and possessed of considerable wealth, who was believed, until that time, to stand high in her mistress's confidence. Eight other women of the Zenana believed themselves marked out for destruction. Another princess, who possessed a jaghire or landed estate near Meerut, frequently ordered the ears or noses of her attendants to be cut off for slight offences; and one of her dancing girls was imprisoned under ground, and starved to death, she herself keeping watch until she heard the last faint moans of her expiring victim.[2] Such enormities present a dreadful picture of Indian despotism, and fully bear out Mr Orme in his contrast between the manners of Europe under the influence of Christianity, and those of Hindustan, under which poisonings, treachery, and assassinations, are daily committed by the votaries of ambition, as are rapines, cruelty, and extortions, by the ministers of justice.

From the great extent of the Mogul empire, the influence of the supreme power was but feebly felt in its distant parts, and the kingdom was accordingly divided into distinct provinces, in which deputies or viceroys, called nabobs, ruled with delegated power. Those provinces were again subdivided into districts, which were committed to the subordinate administration of rajahs. These districts might consist of one town and its territory, or of a thousand towns; and hence the Hindu system of provincial government comprehended different degrees of princely dignity and dominion, according to the extent and value of the lands that were assigned. But all these various rulers, though each was amenable to the one above him, exercised supreme and despotic sway within their own districts. There was also a special rank of princes called subahdars, who ruled in the extremities of the kingdom, in which the rigour of the supreme authority was weakened by distance, with higher rank and greater powers than the rajahs. The Deccan was under the administration of a subahdar, as was also the extensive and distant province of Bengal. The absolute power of the Great Mogul descended without any loss of vigour to all its inferior delegates; and in this manner the whole of the country groaned under the dominion of numerous tyrants. From this extensive delegation of the superior power, it happened, that on the decay of the Mogul empire, the provincial rulers gradually acquired independence, and, in their warfare with each other for dominion, filled the country with rapine and bloodshed. "Hindustan," says Major Rennell, "even under the Moguls, may be considered as a collection of tributary kingdoms, each accustomed to look no farther than its own particular viceroy, and of course ever in a state to rebel, when the imbecility of the emperor, and the ambition of the viceroy, formed a favourable conjuncture;" and accordingly he observes that "rebellions, massacres, and barbarous conquests, make up the history of this fair country, which, to an ordinary observer, seems destined to be the paradise of the world."[3] And to the same purpose Orme remarks: "If the subjects of a despotic power are everywhere miserable, the miseries of the people of Hindustan are multiplied by the incapacity of the power to control the vast extent of its dominion; and thus," he adds, "the contumacy of vicegerents resisting their sovereigns, or battling among themselves, is continually productive of such scenes of bloodshed, and of such deplorable devastations, as no other nation in the universe is subject to."[4]

In the Mogul sovereign was vested the whole administration of the state, the executive as well as the legislative and judicial powers. In his executive duties the law assigned him a council of state, the functions of which generally devolved on some favourite minister. His legislative duties were simple, seeing that religion was the law, and that the sacred ordinances constituted the judicial code, which it would be impiety to alter. The Brahmins being the sole interpreters of the holy books, acted as assessors to the nabob or rajah, or his delegates in the judicial office. The mode of administering justice had an appearance of openness and fairness, and the forms of the court were extremely simple. The seat of justice was exposed in a large area, capable of containing the multitude; and here justice was administered by the duan or judge, in the absence of the nabob; the plaintiff having attracted attention by his importunate clamours, was ordered to be silent, and to advance before the judge, to whom, after having prostrated himself, he told his story in the plainest manner. He visited the judge in private, gave the jar of oil, and his adversary bestowed the hog, which broke it; the friends who had influence interceded, but it was the largest bribe that ultimately gained the cause. The forms of justice were no doubt preserved; witnesses were heard, but browbeaten, and removed if their evidence did not please the judge. "Proofs of writing," says Orme, "are produced; but deemed forgeries and rejected, until the way is cleared for a decision, which becomes totally or partially favourable, in proportion to the methods which have been used to render it such; but still with some attention to the consequences of a judgment which would be of too flagrant iniquity not to produce universal detestation and resentment." In Hindustan, accordingly, the judicial tribunals afforded no refuge to the oppressed; they were rather instruments of tyranny, by which the unhappy people were plundered under the forms of law. Avarice is the reigning vice of Hindustan, and power afforded all public functionaries the means of its gratification. The havildar, the head of a village, called his habitation the durbar, and plundered of their meal and roots the wretches within his jurisdiction; the zemindar fleeced him of the small pittance of silver which his penurious tyranny had scraped together; the phoosdar, or military commandant of the province, seized on the zemindar's collections, and bribed the nabob's connivance in his villanies by a share of the spoil; the covetous eye of the nabob ranged over his dominions for prey, and employed the plunder of his subjects in bribing or in resisting his superiors. "Subject to such oppressions," says Orme, "property in Hindustan is seldom seen to descend to the third generation." It is not therefore surprising that the Hindus prefer English courts of law to those with which they were cursed while under the rule of their native princes.

Taxation. This important subject will perhaps be more properly considered when we come to treat of the political transactions of the British in India, and of their administration of the revenues of the Mogul empire. In the mean time it may be observed, that those revenues chiefly arose from a tax on the land, imposed by the sovereign, or from a share in its produce, which, according to some, he received as proprietor of the soil. The tax was immediately paid into the imperial treasury by the zemindar, who collected it from a variety of under tenants, holding by peculiar tenures, which will be afterwards more particularly considered. The proportion of the crop claimed by the government varied, according to the fertility of the land, from a sixth to a twelfth part; and being ascertained by the proper officers, it was either paid in kind or in money. Custom-duties were levied on imports by sea, and by land on the transit of goods at the different toll-bars in the country. These were sometimes farmed out by the local authorities. Other taxes are enumerated in the sacred books, on mercantile profits, on which was levied a fiftieth, or even a twentieth part; on the accumulation of property in gold, silver, precious stones, cattle; on the purchases and sales of merchants; and on mechanics and serving-men, who were liable for a contribution of labour at the rate of a day in each month. A trifling poll-tax was imposed on the meaner inhabitants. Exclusive rights of manufacture, and trade in certain articles, such as salt, arrack, betel-nut, and tobacco, were also granted to the inhabitants for an annual payment.[1] The Hindu rulers, however ignorant in other matters, thus appear to have been familiar with all the most approved modes of plundering their subjects; and these failing, they had recourse to open violence. It is mentioned by Mr Rickards, whose views of Indian manners seem to be equally judicious and accurate, that those revenue systems of India never were, "because they never could be, literally enforced, the real practice being to exact and plunder, without any fixed rules, all that could be squeezed out of defenceless subjects." After enumerating the various revenue officers who acted under the sovereign, such as nabobs, dewars, foujedars, amildars, tehsildars, jaghiredars, zemindars, polygars, talookdars, rajahs, naiks, wadeyars, &c., he adds, "swarms of harpies were thus spread in every direction, even to the mundils and potails of villages; and despotism established, as it were, in detail, in every corner of the land. Power was here a license to plunder and oppress. The rod of the oppressor was literally omnipresent; neither persons nor property were secure against its persevering and vexatious intrusions. The common transactions of life became objects of punishment or extortion. And no other principles being known or dreamt of in India than arbitrary power on the one hand, and abject submission on the other, a state of society was fixed and rooted in the manners, the poverty, and the ignorance of the people, of which no parallel nor resemblance is anywhere to be found in European states."[2]

Hindu laws. The laws of the Hindus which apply to property, and which regulate sales or purchases, loans, transfers, and deposits of goods, though they are founded on the principles of justice, are frequently rude, loosely expressed, and such as, along with a corrupt judicature, must leave every thing to the discretion of the judge. The law fixes the price of commodities, regulates the interest on money, and on the loan of goods, such as grain, fruit, &c.; and, by a peculiar injustice, imposes a greater interest on the servile castes than on the Brahmins and soldiers. The modes of enforcing debts are the same as in all other countries. The creditor may seize upon the property or person of his debtor, whom he may beat or otherwise maltreat, and, if he be of an inferior caste, compel to labour for his profit. He may even confine his wife or children. Another mode of enforcing payment is by sitting dhurna, a ceremony already explained. The laws of inheritance form an important branch of the Hindu code, though it is justly remarked,[3] that "the slavery to which the rights of parent and husband subject the female, abolishes at once all suits of dowries, divorces, jointures, and settlements." On the death of the father, his property is divided amongst his children, who frequently live together, with the elder brother as their head. If they separate, the eldest receives one twentieth more than the others. Science and good conduct are mentioned as grounds of preference, as vice of exclusion; and thus is laid the foundation of endless disputes. In some cases the gross and cruel superstition of the Hindus subverts the principles of justice; the blind, the deaf, the dumb, or those affected with leprosy, or any other incurable disease, being deprived of their share in the paternal inheritance. Children of different castes inherit according to the rank of the mother, and those of concubines receive only half the share of legitimate children. Until the practice was legalized by the British government, the Hindus had no idea of devising by will; nor were any members of the family at liberty to alienate, except in certain particular cases, any part of the common stock.

The criminal code of the Hindus, though no longer in operation except in some few states, governed by Hindu princes, merits a brief notice. The offences of the low-born tribes against the higher receive a full measure of vengeance, whilst the latter are but slightly punished for the injuries which they inflict on their inferiors. It is enacted, that if a Sudra strike a Brahmin with hand or foot, the offending member shall be cut off; if he insult him with his tongue, it shall be slit, or a red-hot iron shall be thrust into his mouth. Murder is punished with death, theft with fine, and the more heinous cases with various degrees of mutilation, with impaling, burning alive, and crucifixion. The multifarious cases of offence which are detailed in the Hindu code, such as throwing ordure, or the refuse of victuals, on another, spitting upon him, &c., are many of them insignificant, and scarcely merit the minute enumeration which is given. The illicit intercourse of the sexes is a complicated subject, into the details of which it is unnecessary to enter. It seems principally directed against the want of chastity in women, which is punished as the most shocking of crimes, by burning on a heated plate of iron; or against the lower tribes, in whom adultery with a Brahmin woman is considered as the climax of human depravity, scarcely to be avenged by any punishment, however dreadful. On the other hand, crimes committed by the higher classes against the lower are very slightly punished; the scale of punishment being in all cases graduated in an inverse ratio to the rank of the offenders.

Architecture.

In architecture, in the fine arts, in painting and music, the Hindus are greatly inferior to the Europeans. The pagodas, the tombs, and other structures, the only remaining specimens of their architecture, are, according to some, more remarkable for the magnitude of their dimensions than for their just proportions or fine taste. "The columns and pillars," says Tennant, "which adorn their immense pagodas, are destitute of any fixed proportions; and the edifices themselves are subjected to no rules of architecture." He afterwards adds, that the celebrated mausoleum at Agra has little to boast of either in simplicity or elegance of design. "The immensity of its size, its costly ornaments, and the minute exactness of its decorations in particular parts, are worthy of notice; but they afford much stronger proofs of the wealth and magnificence of Shah Jehan, than the correctness of its taste." The tombs and religious edifices of Hindustan are, on the other hand, highly commended by Bishop Heber for delicacy, beauty, and taste. The mausoleum at Agra he celebrates as the most splendid building, in its way, that he had seen in India.[1] Humaion's tomb at Delhi he also praises as a noble building of granite, inlaid with marble, and in a very chaste and simple style of Gothic architecture; and of the imanbara or cathedral at Lucknow he remarks, "The whole is in a very noble style of eastern Gothic, and, when taken in conjunction with the Roumi Durwazu which adjoins it, I have never seen an architectural view which pleased me more, from its richness and variety, as well as the proportions and general good taste of its principal features."[2] There seems no doubt, from the splendid structures that are still found in different parts of Hindustan, that architecture and the kindred arts had flourished amongst the Hindus of a remoter age; though it is mentioned by Colonel Todd, that very few good specimens of the art have been executed within the last 700 years. His description, however, of the splendid Jain temples at Ajmeer and other parts, some of them erected long prior to the Christian era, and distinguished alike by chasteness and beauty of design, and by rich and exquisite finishing, must convince the most incredulous, that in these remote times the arts had made great progress in Hindustan. These structures are not merely monuments of labour, but of taste; they evince the perfection of art; and in symmetry, beauty of proportion, unity of design, and splendid ornament, they rival the noblest productions of classical Europe. The history of the people who have raised these structures presents a wide field for antiquarian research, on which Colonel Todd has entered with the brilliant promise of interesting results; and to his learned inquiries and eloquent and poetical descriptions we refer for a further account of those ancient monuments of Hindu art.[3]

Painting.

Of the Hindu paintings the chief merit is brilliancy of colour, rather than taste in the design or liveliness of expression. They imitate most exactly, and are excellent draughtsmen; and they draw specimens of natural history with much neatness and accuracy. "The laborious exactness with which they imitate every feather of a bird," says Tennant, "or the smallest fibre on the leaf of a plant, renders them valuable assistants in this department; but farther than this they cannot advance one step. If your bird is to be placed on a rock or upon the branch of a tree, the draughtsman is at a stand; the object is not before him, and he can supply nothing.[4] Since this period, however, the Hindus have made great advances in the art of painting; and some of their portraits display taste and expression that would not discredit European artists.

Music.

The music of the Hindus is rude and inharmonious. They have numerous instruments, but those are preferred which make most noise; the beating of the great drum is reckoned an emblem of sovereign power.

Literature.

The literature of the Hindus has been generally rated very low by European writers, and has been represented as consisting in long desultory poems, inflated and extravagant in their style, containing, under the idea of a history, a tissue of absurd fables, interspersed with passages or episodes that are tender and passionate, and possess all the sweetness of pastoral poetry. They are said to be totally destitute of historical annals, and their geography is a mass of errors. Nor has their astronomy those claims to antiquity which were at first allowed. Accurate inquiry has proved this science to be in its infancy amongst them.[5] The want of historical records by the Hindus is strongly denied by Colonel Todd, who has himself composed a history of the Rajpoots from native works, which he found in the libraries of their princes, and he asserts that in those depositories of Hindu literature many more works exist, which would reward the researches of the learned. "The works of the native bards," he observes, "afford many valuable data in facts, incidents, religious opinions, and traits of manners." "In the heroic history of Pirthi-raj, by Chund," he adds, "there occur many geographical as well as historical details, in the description of his sovereign's wars, of which the bard was an eye-witness, having been his friend, his herald, his ambassador, and finally discharging the melancholy office of accessory to his death, that he might save him from dishonour." The Brahminical accounts of the endowments of temples, of their dilapidation and repairs, supply historical and chronological details; also the legends respecting places of pilgrimage and religious resort. Much historical information lies hid in the controversial records of the Jains; and, says Colonel Todd, "those different records, works of mixed historical and geographical character, which I know to exist, *rasahs* or poetical legends of princes, which are common, local *puranas*, religious comments and traditionary couplets, with authorities of less dubious character, namely, inscriptions cut on rocks, coins, copperplate grants, containing charters of immunities, and expressing many singular features of civil government, constitute, as I have already observed, no despicable materials for the historian." Colonel Todd is of opinion that the ancient records of the Hindus are more complete than the early annals of the European states.

---

[1] The following is his description of this monument of Hindu art:—"It stands in a square area of about forty English acres, enclosed by an embattled wall, with octagonal towers at the angles, surmounted by open pavilions, and four very noble gateways of red granite, the principal of which is inlaid with white marble, and has four high marble minarets. The space within is planted with trees, and divided into green alleys, leading to the central building, which is a sort of solid pyramid, surrounded externally with cloisters, galleries, and domes, diminishing gradually in ascending it, till it ends in a square platform of white marble, surrounded by most elaborate lattice-work of the same material, in the centre of which is a small altar tomb, also of white marble, carved with a delicacy and beauty which do full justice to the material, and to the graceful forms of Arabic characters, which form the chief ornament."

History.

Prior to Alexander's expedition into India, which took place 327 years before the Christian era, the Greeks appear to have known little of these eastern countries, except from the confused accounts of travellers; and nothing whatever of the countries beyond the sandy desert of the Indus, which, with its tributary streams, was the limit of Alexander's progress eastward. The men of science who accompanied this warlike prince brought to Europe full and accurate accounts of the countries which he had conquered; and the spirit of inquiry, now awakened amongst the Greeks, was still further gratified by the ample accounts of Megasthenes, the ambassador sent to India by Seleucus, and who resided long at Palibothra, the capital of the Prasii, near the mouth of the Ganges. The Greek writers, drawing their information from those sources, describe the leading features of Indian society and manners, and with an accuracy which stamps authenticity on their narratives. It is unnecessary to dwell upon the particulars of Alexander's expedition, which are fully described in many other works; and from that until the period of the Mahommedan conquest, when the native records commence, there is nearly a complete chasm in the annals of Hindustan. The Hindus had either no records, or these had been destroyed during the intestine commotions which have always prevailed in India. The historical poem, the Mahabarat, is a tissue of extravagant fables. Ferishta's history, written early in the seventeenth century, is supposed to have been collected from Persian authors; and the most valuable part of it begins after the commencement of the Mahommedan conquests. It was about the year 1000 that Hindustan, formerly ruled by a pure Hindu monarchy, fell under the sway of the Mahommedan conquerors, who subdued all the provinces west of the Ganges, and formed them into one great empire. On the fall of this empire, India became one scene of commotion and war, and her finest provinces were laid waste. It was then that the Mahratta empire arose, like a meteor in the political sky, blazing for a while, and soon fading into obscurity; and by its fall paving the way for the ascendency of the British, whose powerful sway now extends from the Himalaya Mountains to Cape Comorin. We shall endeavour to sketch the leading and most eventful scenes of that political drama, which has thus terminated in the subjection of all India to one great ruling power.

Conquest by the Mahommedans.

The Mahommedan powers having subdued Persia and the neighbouring countries, made occasional inroads into India; and, about A. D. 1000, Mahmoud entered Hindustan, in which he effected a permanent establishment. This prince was the grandson of Subuctagi, the ruler of Ghizni, consisting of the tract which composed the kingdom of Bactria after the division of Alexander's empire, namely, the countries lying between Parthia and the Indus, and south of the Oxus. He invaded India twelve several times, massacring in his intolerant rage the Hindus as infidels, and defacing and destroying their temples. "Nothing," observes Major Rennell, with his usual force, "offends our feelings more than the progress of destruction, urged on by religious zeal, as it allows men to suppose themselves agents of the divinity, thereby removing those checks which interfere with the perpetration of ordinary villany, and thus makes conscience a party where she was meant to be a judge." The last invasion of India by Mahmoud was in 1024, and in four years afterwards he died. His dominions comprehended the eastern provinces of Persia, nominally all the Indian provinces westward of the Ganges, to the peninsula of Gujerat, and from the Indus to the mountains of Ajmere. The Punjab, or the tract watered by the Indus, and its five tributary rivers, was all that was subjected to the regular government of the Mahommedans. The rajpoots of Ajmere defended their rugged mountains and close valleys with obstinate valour. The Ghiznian empire was in the year 1158 divided into two; the western portion being seized on by the family of the Gaurides (so denominated from Gaur or Ghir, a province or city lying beyond the Indian Caucasus), whilst the countries on the Indus were possessed by Chusero or Cusroe, who fixed the seat of his empire at Lahore. The Mahommedans now extended their conquests eastward; and Mahommed Gori, in 1194, took the city of Benares, which he abandoned to pillage. He carried his arms to the south of the river Jumna, and took the fortress of Gualior; he also reduced the eastern frontier of Ajmere. He was succeeded in 1205 by Cuttub, who fixed his capital at Delhi, and founded in Hindustan the dynasty of the Patans or the Afghans, who inhabited the mountainous tract situated between India and Persia. The Emperor Altmush succeeded him in 1210, and extended his conquests over Bengal. In his reign the renowned Ghenghiz Khan subdued the western empire of Ghizni; and the Moguls, or the Monguls, his successors, about the year 1242, made frequent irruptions into the north-western provinces of Hindustan. The country was in the mean time a scene of intestine commotion, from the contests of rebellious chiefs aspiring to supreme authority, and from the irruptions of the predatory hill tribes into the plains below. In 1265, about 100,000 of these plunderers were put to the sword, and a line of forts constructed along the foot of the hills. In the mean time, the Patan monarchs of Delhi were prosecuting their conquests eastward, and the Moguls were making incursions into the western provinces; and a considerable number of them under Ferose II. were at length permitted to settle in the country in the year 1292. In 1293 this emperor invaded the Deccan, or the country lying to the south of the Nerbuddah and the Cuttack rivers. He was deposed and murdered by Alla, the governor of Gurrah, who advised the expedition, and who extended his conquests in the Deccan. Cafoor, one of his generals, penetrated into the Carnatic, or the peninsula lying to the south of the Kistna river, in 1310. Rebellions breaking out in Tellingana, a principality in the Deccan, it was again subjugated in 1322 and in 1326, in which year Alla died, and the Carnatic was ravaged from sea to sea. Under a succeeding emperor, Mahommed III., the Mahommedans were driven from the Deccan and Bengal, and lost much territory in Gujerat and the Punjab. Ferose III., who succeeded, was more intent on domestic improvement, and in constructing canals, than on foreign conquest. He died in 1388, and Mahmoud III. succeeded, during whose minority great confusion ensued; and in 1398 the country was invaded by Tamerlane, who advanced to Delhi, which submitted without a struggle, and was abandoned to the fury of the soldiery, who continued for several days to massacre the defenceless inhabitants. The military irruption of Tamerlane into Hindustan was more for the sake of plunder than of conquest, though it added to the existing anarchy of the country. In 1413 Mahmoud died, and with him ended the Patan dynasty, founded by Cuttub in 1205. A period of great confusion followed, and numerous competitors contended for dominion. This state of anarchy, which came to a height under Ibrahim II. in 1516, paved the way for the conquest of Hindustan by Sultan Baber, a descendant of Tamerlane and of Ghenghiz Khan, who reigned over a kingdom composed generally of the provinces situated between the Indus and Samercand. Being dispossessed of the northern portion of his dominions by the Usbecks, he invaded India, and in 1525 defeated the emperor of Delhi, and conquered the north-eastern provinces of India. He was succeeded, after a reign of five years, by his son Humaioon, who was driven from his throne by the rebellion of Sheer Khan, whose successful usurpation was succeeded by such a period of disorder, five sovereigns having appeared on the throne in the course of nine years, that Humaioon was recalled in 1554, and died the following year, leaving his son, the celebrated Acbar, only fourteen years of age, the heir to the throne. His was a long and glorious reign of fifty-one years, in which the revolted provinces were reduced from Ajmere to Bengal, and consolidated into one empire by the unlimited toleration of the Hindus and all others, and generally by a just and wise policy. In 1585 and the subsequent years he invaded the Deccan, which, by the dissolution of the Bahmenee empire, was divided among the sovereigns of Bejapoor, Ahmednagur, and Golconda, whilst another army was reducing the country of Cashmere in an opposite direction. At the time of Acbar's death in 1605, he had possession of the western part of Berar, Candeish, Tellingana, a division of Golconda, and the northern part of Ahmednagur, the capital of which was taken in 1601, after a long and bloody siege, and an unsuccessful attempt to relieve the place by the confederated princes of the Deccan.[1] Acbar died in 1605, at which time his empire was divided into fifteen viceroyalties, called subahs; namely, Allahabad, Agra, Oude, Ajmere, Gujerat, Bahar, Bengal, Delhi, Cabul, Lahore, Moultan, Malwah, Berar, Candeish, and Ahmednagur. He was succeeded by his son Selim, under the title of Jehanguire. It was in his reign, in 1615, that Sir Thomas Roe, the first English ambassador, was sent to the Mogul emperor of Hindustan; and the Portuguese had by this time acquired considerable settlements in Bengal and Gujerat. Shah Jehan, who disturbed his father's reign by constant rebellions, succeeded to the throne in 1627, and pursued his conquests in the Deccan with renewed vigour, filling the country with plunder and devastation. It was in this reign, in the year 1633, that the first serious quarrel took place between the Portuguese and the Moguls, when the former were expelled from Hooghly on the Ganges. In 1658 the country was again distracted by the civil wars of the emperor and his sons, and of the sons amongst themselves contending for dominion. Shah Jehan died on the 21st of January 1666, after being seven years confined in the castle of Agra. The Mogul empire at his death extended from Cabul to the Nerbuddah, westward of this river to the Indus, and eastward it comprehended Bengal and Orissa; and to the south the Moguls had reduced a large tract of country bounded by Berar on the east, westward by the hills towards Concan, and by the dominions of Golconda and Bejapore to the south. These convulsions, by which India was at this time distracted, ended in the elevation to the throne of the renowned Aurungzebe, the youngest son of Shah Jehan, whom he had deposed; he had also murdered or expelled his three brothers. In 1660, Aurungzebe, who took the title of Allumgere, or Conqueror of the World, was firmly seated on the throne; and from that period until the year 1678, Hindustan enjoyed more profound peace than it had ever before known. In the mean time Aurungzebe invaded the Deccan, which during the latter part of his reign was, with the exception of a few mountainous tracts, subdued by his victorious arms, and rendered tributary to the ruler of Delhi. He was afterwards engaged, in 1678, in quelling the rebellion of the Patans beyond the Indus, and the Rajpoot tribes, by whom he was hemmed in amongst the mountains, and narrowly escaped. He again invaded the country in 1681, and took and destroyed Cheitore, the capital, and all the objects of Hindu worship found there. The obstinate resistance of these gallant mountaineers at last extorted peace from the mighty monarch of the Mogul empire.

Reign of Acbar;

of Aurungzebe.

Progress of the Mahrattas.

But Aurungzebe had now to contend with another enemy for the dominion of India. In the south the Mahratta power was fast rising into importance. Sevajee, the founder of this new state, was a military chief, the illegitimate son of the rana of Odeypoor, the chief of the Rajpoot princes. In his youth he resided at Poonah, on a zemindary estate obtained by his father. Here he collected around him a numerous banditti, and plundered the country. The number of his followers gradually increasing, he extended his ravages still farther into the dominions of Bejapore, and acquired an immense booty, which enabled him to increase his force, and openly to resist the troops of Aurungzebe which were sent against him. He expired in his fortress of Raynee, of an inflammation in the chest, at the age of fifty-two, on the 5th of April 1682. His whole reign was one continued scene of war and political intrigue, in which he displayed the talents of a consummate general and an able and crafty statesman. "He met," says Orme, "every emergency of peril, however sudden and extreme, with instant discernment and unshaken fortitude; the ablest of his officers acquiesced in the eminent superiority of his genius, and the boast of the soldier was to have seen Sevajee charging sword in hand."[2] At his death, his empire, with the exception of the small territory of Goa on the south, Bombay, Salsette, and an inconsiderable tract on the north, comprised a tract of country about 400 miles in length and 120 in breadth. He was besides in possession at one time, towards the Eastern Sea, of half the Carnatic. By his own talents he had thus acquired a permanent sovereignty, "established," says Orme, "on a communion of manners, customs, observances, language, and religion, united in common defence against the tyranny of foreign conquerors, from whom they had recovered the land of their own inheritance." Sevajee was succeeded by his son Sambajee, who was afterwards betrayed into the hands of Aurungzebe, and barbarously put to death. Aurungzebe died in 1707, in the ninetieth, or, according to some, the ninety-fourth year of his age, at Ahmednagur, in the Deccan, in the subjugation of which he had been engaged from the year 1678 until his death. He was for the most part engaged in the field during the last fifteen years of his life. Whilst he was absent in the Deccan, the peace of the empire was disturbed by insurrections of the Rajpoots in Upper India, and of the Jauts, now for the first time known in any other character than that of banditti.[3] Under his reign the Mogul empire attained to its height. His dominions extended from the tenth to the thirty-fifth degree of latitude, with nearly as many degrees of longitude; and his annual revenue was equal to thirty-two millions sterling.

Internal disorders.

After the death of Aurungzebe, the sovereignty of the empire was disputed by his four sons, Munzum, Azem, and Kaum Buksh, who severally contended with their elder brother, and Acbar, who thirty years before had been engaged in rebellion, and fled to Persia. Munzum and Azem met in the field with armies of 300,000 men on each side, when the latter was defeated and slain, and Munzum ascended the throne under the title of Bahader Shah. He reigned five years, and the empire had been so distracted by civil wars and anarchy, that it required all his exertions to restore order. He was soon after his accession called into the Deccan by a rebellion of his brother Kaum Buksh, which was quelled by his death. He now turned his arms against the Rajpoots and the Sikhs, who for the first time appeared in arms in the province of Lahore. These insurgents he reduced after much trouble and delay; and he took up his residence at Lahore, where he died in 1712, after a short illness, having never during his reign visited either Agra, or Delhi his capital. He left four sons, who immediately commenced a contest for the throne. Azem Ooshawn, who took possession of the treasures, was killed in a battle with his other brothers. Jehan Shah, the youngest, next lost his life in a battle with Jehamder Shah, who was the eldest, and who successfully disputed the possession of the throne with the remaining brother. At the end of nine months, however, he was dethroned by Feroksere, a son of Azem Ooshawn, and great grandson of Aurungzebe, who was elevated to the throne by the influence of two brothers, Abdoola Khan and Hussun Khan, Seids by birth, or descendants of the prophet, whose talents had raised them to reputation and power. It was in this reign that the English East India Company obtained their famous firman or grant, by which they were exempted from all custom duties on the export and import of their goods. This was considered as the commercial charter of the Company as long as they required protection for their trade. In 1717 Feroksere was deposed and blinded by the two Seids, Hussun and Abdoola, to whom he owed his elevation to the throne. In his place they chose Ruffieh-ul-Dowlat, a son of Bahader Shah; and in less than a year deposed and put him to death. His brother, who by their means was also made king, met with the same treatment; so that in the course of eleven years from the death of Aurungzebe, four princes of his line had ascended the throne, whilst six others had met the usual fate of unsuccessful aspirants to that dignity. Mahommed Shah, the grandson of Bahader Shah, was placed on the throne by the Seids in 1718, from whose influence he contrived at length to free himself, though not without a rebellion and a battle, in which they were both slain. In the mean time Mahommed Shah was deficient in the vigour which his difficult situation required, and the provincial governors at a distance began to show symptoms of independence. Nizam-ul-Muluck, the viceroy of the Deccan, was the most formidable of those pretenders to sovereignty. He had reduced the provinces of Gujerat and Malwah; and having paid a visit to the imperial court, and observed the dissolute administration of affairs, he quitted the capital in disgust, under pretence of a hunting excursion, for his government of the Deccan. He was deprived of the administration of Gujerat and Malwah, the two provinces which he had acquired. In revenge he encouraged the rulers of these provinces to resist the imperial authority; whilst at his instigation also the Mahrattas invaded the country, and after a severe struggle succeeded, about the year 1732, in completely reducing this long-disputed territory.

Invasion of Nadir Shah.

But a more dreadful calamity was now impending over the distracted empire. The sceptre of Persia had been long swayed by a feeble race of monarchs, and the country became an easy prey to the hardy mountaineers of Afghanistan, who in 1722 laid siege to Ispahan, when the feeble Hussun Shah surrendered the crown to the invader. He had a son Thamas, however, who escaped from the general massacre which ensued, and who was joined by many partisans, amongst others by Nadir, the son of a shepherd of Khorassan, who, with his band of followers, soon distinguished himself as a brave and active supporter of the fallen prince. In 1729 he retook Ispahan, and finally, by his talents, raised himself to the throne of Persia in 1736, having put out the eyes of the unfortunate son of the late monarch. Being afterwards engaged in an expedition against the Afghans, he advanced to the frontier of Hindustan, but without any ulterior views of hostility, when a messenger and his escort, whom he had despatched to the emperor at Delhi, were murdered at Jellalabad by the inhabitants; an outrage which being approved by Mahommed Shah, Nadir prepared for revenge. He gave up the offending city to be pillaged by his soldiers; and advancing to Delhi, was met by the imperial troops, who were totally defeated. The views of the conqueror, however, were not hostile, and two crores of rupees would have purchased his retreat from Hindustan. But this amicable arrangement was frustrated by a dispute between Saadut Khan, subahdar of Oude, and the nizam of the Deccan, for the vacant office of Ameer-ul-Omrah, formerly paymaster of the forces. Saadut Khan, the disappointed candidate, persuaded Nadir Shah that the proffered sum was no adequate ransom for Hindustan; on which Nadir advanced to the capital, which opened its gates to receive him; and for two days thereafter the Persian troops observed the most exact discipline. But in the course of the night a rumour was spread that Nadir was killed, on which the inhabitants rose against their invaders, and massacred many of them. Nadir took severe and immediate revenge. He dispersed his irritated soldiers throughout every quarter of the city, with orders to spare neither age nor sex; and in this indiscriminate slaughter 100,000 persons are said to have perished, whilst the city was set on fire in several places. The imperial treasure was plundered; plate, jewels, and specie, were carried off to the incredible amount of thirty-two millions sterling. Rich bankers and others were forced by torture to disclose their hidden wealth, and a heavy contribution of thirty millions was imposed on the city by the relentless conqueror. Nadir Shah departed from Delhi, of which he had held possession thirty-seven days, in the year 1739; and the nizam still retained possession of the whole power of the empire, which he sacrificed to his own views in the Deccan, where he established an independent kingdom. Nadir Shah died in 1747. In the subsequent confusion, the eastern provinces of Persia, and those bordering on India, were formed by Abdalli, one of his generals, into an independent state, which comprised the ancient empire of Ghizni, and was known under the name of the kingdom of the Abdalli. Mahommed Shah died the same year, after a reign of twenty-nine years. Every day had disclosed the growing weakness of the empire, and strong symptoms of its early and entire dissolution. In 1738 Bengal became independent under Aliverdy Khan, and it was soon afterwards invaded by a numerous army of Mahrattas from Poonah and Berar. About the same time the Rohillas, a tribe from the mountains which separate India from Persia, erected an independent state on the Ganges, within eighty miles of Delhi. Mahommed Shah was succeeded by his son Ahmed Shah, and in the reign of the latter the Mogul empire was finally dismembered. A small territory around Delhi was all that remained to the house of Timur, and it was the scene of devastation, massacres, and famine. The last imperial army that ever assembled was defeated in 1749 by the Rohillas. The Jauts founded a state in the province of Agra; the nizam and Aliverdy ruled in Bengal and the Deccan; Oude and Allahabad were each seized by independent chiefs; Malwah was divided between the Poonah Mahrattas and several native princes and zemindars. Ajmere reverted to its ancient lords, the Rajpoot princes. The Mahrattas, who now contended for the dominion of India, possessed, in addition to their share of Malwah, the greatest part of Gujerat, Berar, and Orissa, besides their ancient domains in the Deccan. "The whole country of Hindustan proper," Major Rennell remarks, "was in commotion from one extreme to another, each party fearing the machinations or attacks of the other; so that all regular government was at an end, and villany was practised in every form. Perhaps in the annals of the world it has seldom happened that the bonds of government were so suddenly dissolved, over a portion of country containing at least sixty millions of inhabitants."[1]

Decay of the Mogul empire.

---

[1] Rennell's *Memoir of Hindustan*, p. lxx.

In 1753 the Emperor Ahmed Shah was deposed by Gazi, the son of Gazi o'Dien, vizir to Mahommed Shah, who placed on the throne Allumguire II., grandson of Bahader Shah, and invested himself with the office of vizir. His perfidious conduct to the family of the viceroy of the provinces of Moultan and Lahore, under Abdalli, the king of the Afghans, involved the emperor in a quarrel with that powerful prince, who advanced from Candahar to Lahore, and thence to Delhi, the gates of which were opened by the feeble emperor, and the defenceless city abandoned for weeks to a licentious soldiery. After the retreat of the Abdallis, the vizir advanced with an army to Delhi, which he entered after a siege of forty-five days. The Mogul emperor was now reduced to the most abject state of dependence, and was at last assassinated by order of the vizir, who was irritated by his correspondence with the Afghan monarch Abdalli Shah, the Rohillas, and the nabob of Oude, with whom he himself was at war. His son took the title of Shah Aulum; he escaped from Delhi when it was besieged by the vizir, and, after a series of misfortunes, at last surrendered to the British, who gave him an asylum, and a pension for his support; and with him, the last of the Mogul sovereigns who enjoyed independent power, closes for ever the glory of this renowned empire.

Contest between the Mahrattas and the Afghans.

In the mean time, amidst anarchy and desolation, the Mahrattas were daily increasing in power; they were engaged in every scene of politics and warfare, from Gujerat to Bengal, and from Lahore to the Carnatic; they possessed extensive sway and vast armies; and their ambition was now to reconstruct a new Hindu empire out of the decayed fragments of the Mogul power. The rising influence of the Afghans under the rigorous sway of Abdalli was the only obstacle to this patriotic or ambitious scheme; and the Mahrattas, in the progress of their conquests northward, encountered for the first time their great rival for the dominion of India. Ahmed Abdalli, king of the Afghans, was taken prisoner when very young by Nadir Shah; he was first his slave, afterwards his mace-bearer, and at his death, having collected a body of troops and other adventurers, he proceeded to his own country, and proclaimed himself king of the Afghans, with the title of Doordowran, or pearl of the age, which was corrupted into that of Dooranee, and became the name of one of the Afghan tribes. Ahmed had extended his dominion over the frontier provinces of Moultan and Lahore, which, in retiring from India, he had left under the administration of his son. These provinces were first invaded by the Sikhs, and afterwards by the Mahratta generals, who advanced to Lahore and expelled the Abdalli prince, and afterwards extended their conquests to the Indus. Ahmed Shah, roused by the loss of his provinces and the dishonour of his arms, collected his troops, and encountered the Mahratta army, amounting to 80,000 veteran cavalry, which was almost entirely destroyed, and the general Duttah Sindia slain. The news of this defeat spread alarm amongst the Mahrattas, and roused them to the greatest exertions. A vast army, consisting of 140,000 horse, besides a numerous train of camp followers, commanded by the most renowned chiefs, took the field, and being unable to cross the Jumna, still swollen by the rains, proceeded to plunder Delhi, the capital. Ahmed Shah, with 150,000 well-disciplined troops, now advanced, and, in his impatience to meet the enemy, plunged with his whole army into the foaming waves of the Jumna, which he crossed in safety. The Mahrattas, struck by this daring exploit, retired to the plain of Paniput, and the armies continued in sight of each other from the 26th October to the 27th January 1761, during which interval several bloody skirmishes took place. On this latter day was fought the battle of Paniput, one of the most decisive and sanguinary recorded in history. The Mahrattas were overthrown with a dreadful carnage. The general, Bhaow, the nephew of the peshwa, the chief of the Mahratta nation, was killed early in the action; most of the other chiefs were slain, and those of the soldiers who escaped from the slaughter of the field were massacred by the irritated peasantry, in revenge for the depredations of the Mahratta cavalry. And of the mighty host engaged in this fatal conflict, only a small remnant, with three generals, returned to the Deccan. This great battle gave an irreparable blow to the Mahratta power, which from this time sensibly declined, and the victorious Abdalli sought no other fruit of his victory. He returned to his capital after remaining a few months at Delhi, having recognised the grandson of Allumguire as emperor, under the title of Shah Aulum the Second.

Battle of Paniput.

Rise of the European power.

A new scene was now about to open in India. The Europeans, who as traders had long maintained establishments on the coasts, began to assume an entirely different character; to contend with each other in the field for dominion, and to mingle in all the wars and politics of the interior. It was necessary, for carrying on the domestic trade of India, and more especially in providing goods for the supply of Europe, that a body of experienced servants should reside on the spot, in order to collect and to purchase commodities for exportation; an employment which, owing to the poverty and abject state of the natives, and their peculiar customs, involved duties of the most minute and laborious detail. During the decline of the Mogul government, the tranquillity of India was frequently shaken by the contentions of rival chiefs; and the slight security afforded, even in the best times, to commerce, became in this manner more imperfect. For the reception of the goods which it was necessary to collect and store up, that cargoes might always be in readiness for the Company's ships, warehouses were built, which, with the counting-houses, and other apartments for the agents and business of the place, constituted the factories of the Company. These factories contained a valuable store of property, which, in the disordered state of India, it became necessary to secure from the rapacity both of governments and of individuals. They were therefore strongly built and fortified; their inmates were armed and disciplined; and, for better security, regular troops were occasionally maintained in those mercantile garrisons. In these defensive arrangements of the Company we may discern the rudiments of their future empire.

The territorial acquisitions of the European companies were, however, still inconsiderable. The English East India Company had in 1698 been permitted to purchase the zemindaryship of the three towns of Sootanutty, Calcutta, and Govindpore, with their districts, to which was afterwards added a district extending ten miles from Calcutta, on each side of the river Hooghly, containing thirty-seven towns. On the Coromandel coast the English possessed Madras, with a small adjoining territory five miles along the shore, also Fort St David, in 11. 40. north latitude, with other places, such as Vizigapatam and Balasore; and on the west coast their principal settlement was the island of Bombay. Factories were also established at Surat, Tellicherry, and several other places. The business of the Company was managed by the three independent presidencies of Bombay, Madras, and Calcutta. The presidency consisted of a governor and council of nine, twelve, or any greater number of members, as might seem expedient, in a majority of whom all power was vested. The members of the council were not excluded from other more lucrative offices, which were, in general, shared amongst them. These offices were chiefly in the gift of the president, and, by means of his influence, the council were, in a great degree, placed under his control. The governor and council exercised the most ample powers over the servants of the Company; and with regard to all others, they could seize and imprison them, and afterwards send them to England. The powers of martial law were bestowed on them at an early period, for maintaining the discipline of the troops under their orders; and, in 1661, a charter of Charles II. gave them the power of administering civil and criminal justice according to the laws of England.

Pondicherry, with a small appendage of territory, was the principal seat of the French power on the continent of India. It had under its authority three factories, one at Mahé, on the Malabar coast, not far south from Tellicherry; one at Karical, on the Coromandel coast; and one at Chandernagore, on the river Hooghly, in Bengal. The form of government was the same in the French as in the English settlements.

In 1744 France and England, from being auxiliaries, became principals in the war which was then raging in Europe, and the flame soon communicated to their distant colonies. In India the two rival powers were quickly involved in hostilities, which, however, were followed by no important result; and the English settlement of Madras, which had been taken by the French king, was restored at the peace of Aix-la-Chapelle. It was soon after this that the French and English, in supporting the contending claims of the native princes, again came into collision. At the respective settlements of the two Companies, the number of troops assembled during the previous war was greater than was necessary for defence, and the servants of the Companies, with such means at their disposal, now began to meditate schemes of conquest. The intricacies of Indian politics, and the family connexions of the different claimants who contended for power and dominion, need not be described in detail, as it would neither be instructive nor acceptable to the general reader. A brief sketch is all that will be necessary to explain the nature of those transactions which so deeply affected the future condition of India, and the relations of the parties engaged in them.

When Nizam-ul-Mulk was appointed ruler of the Deccan, with the title of subahdar, by the Emperor Aurungzebe, a chief named Sadatullah was nabob of the Carnatic. At his death, his son Doost Ali succeeded him as nabob, which proved displeasing to the nizam, who claimed the right, as delegate of the emperor, to appoint the viceroy of the Carnatic. He accordingly chose, first his general Cojah Abdoolla, and afterwards Anwar ad Dien Khan, known to the English as Anoverdy Khan, to be governor of the Carnatic in 1745. It was between these two families that the contest now began for the government of the Carnatic; Chunda Saheb, a distant relative of the family of Sadatullah, being supported by the French under their aspiring and ambitious governor Dupleix. The death of Nizam-ul-Mulk, in 1748, at the extreme age of 104, occasioned another dispute in the succession to the government of the Deccan, between Nazir Jung, his son, who was supported by the English, and Mirzapha Jung, his grandson by a daughter, who was aided by Chunda Saheb and the French. The latter in 1749, with 40,000 native troops, 400 French, 100 Caffres, and 1800 Sepoys, advanced against Anwar ad Dien. His camp was gallantly stormed by the French troops, he himself was slain, at the age of 107, his eldest son was taken prisoner, and his second son, Mahommed Ali, with the wreck of his army, escaped to Trichinopoly. Nazir Jung, hearing that the nabob of the Carnatic was defeated, collected an army, and summoned Mahommed Ali from Trichinopoly to his aid. He also requested assistance from the English, who sent Major Laurence from Fort St David with 600 Europeans to join his army. When the armies approached each other, D'Auteuil the French commander, being deserted by some of his officers, suddenly retreated to Pondicherry, leaving to their fate Mirzapha Jung, who surrendered to his uncle, and was immediately put in irons, and Chunda Saheb, who followed with his troops to Pondicherry. But the enterprising Dupleix made new exertions, and having again taken the field, he attacked the camp of Nazir Jung, his former ally, who in the confusion was shot through the heart. Mirzapha Jung being now freed from imprisonment, assumed the authority of subahdar. He was afterwards shot dead with an arrow in an action with the rebellious Patan chiefs, and, by the influence of M. Bussy, who commanded the French troops, Salabut Jung, the eldest surviving son of Nizam-ul-Mulk, was raised to the government. After some unsuccessful operations, the English, with their allies, were compelled to take shelter under the walls of Trichinopoly, which was now besieged, though with little effect, by the enemy.

In this indecisive state of affairs at Trichinopoly, it was suggested by Captain Clive, who had already distinguished himself by desperate bravery and great military skill, that it would be advantageous to carry the war into the enemy's country; and being intrusted with the execution of his own bold designs, he began an attack on Arcot, the capital of Chunda Saheb. He had under him 210 Europeans and 500 Sepoys; and so secret and sudden were his motions, that he was master of the enemy's capital ere they were apprised of his march. Here he was soon invested, in the fort which defends the town, by a numerous army, and several practicable breaches being made, an assault took place, which was repulsed with loss; the assailants were finally compelled to raise the siege, and being pursued by Clive, were attacked and totally defeated on the plain of Arani, on the 3d of December 1751. The forts of Tinnery, Conjeveram, and Arani, immediately surrendered to Clive, who returned in triumph to Fort St David. He was soon recalled by the operations of the enemy, who were encouraged by his absence again to take the field. With a very inferior force he adventured on a battle, and by the well-concerted manœuvre of sending round a detachment to fall upon the rear of the enemy, whilst the English charged with the bayonet in front, he obtained a decisive victory, and the hostile army was saved from total ruin only by the darkness of the night. On his return to Fort St David, Clive was superseded in his command by Major Laurence, who detached him with 400 Europeans, a few Mahratta soldiers, and a body of Sepoys, to cut off the enemy's retreat to Pondicherry, in which he was, as usual, completely successful, having made the French commander M. d'Auteuil prisoner, with all his troops. The enemy were now greatly distressed for want of provisions; and Chunda Saheb, deserted by his troops, surrendered to the king of Tanjore, an ally of the English, by whom he was beheaded, in order to prevent all disputes with the Mysorean and Mahratta chiefs about the custody of his person. After the flight of Chunda Saheb, his army was attacked and routed by Major Laurence; and the island of Syringham, where his troops were encamped, was taken, with about 1000 French soldiers, under the command of Mr Law, the son of Law the author of the Mississippi scheme. Notwithstanding these disadvantages, Dupleix was not discouraged. The English resolved to commence the siege of Gingee, which was garrisoned by the French. In this operation they failed. But the French were afterwards defeated in an action near Bahoor, two miles from Fort St David; and the two forts of Coveling and Chingleput were reduced by Captain Clive.

Early in January 1753 the two armies again took the field. The French force consisted of 500 European infantry, sixty horse, 2000 Sepoys, and 4000 Mahrattas, commanded by Morari Row. The English had 700 European infantry, 2000 Sepoys, and 1500 horse belonging to the nabob. The two armies, avoiding a general action, watched each other's movements, when General Laurence was apprised that Captain Dalton, the commandant of Trichinopoly, had only provisions to serve him three weeks. He immediately marched with all his forces to his relief, and being followed by the French, this place became the object of an active contest, from May 1753 till October 1754. We have already stated that the two main points of dispute between the French and English were, first, the succession to the government of the Deccan; and, secondly, to that of the Carnatic; the English, in the first of the disputes, supporting the claims of Nazir Jung, the son of Nizam-ul-Mulk, against Mirzapha Jung, the grandson of the nizam, who was supported by the French. After the death of Nazir Jung, who was killed in the attack of the French upon his camp, Mirzapha Jung succeeded to the subahdarship of the Deccan. He was killed in battle, as already related, by an arrow, when, through the influence of the French commander, M. Bussy, Salabut Jung, the eldest surviving son of Nizam-ul-Mulk, was raised to the vacant throne. But on the death of Nazir Jung, his eldest son Ghazee ad Dien solicited and received from the Mogul the appointment of subahdar of the Deccan; and he appeared at Aurungabad in October 1752, to support his title, at the head of 150,000 troops. The Mahrattas at the same time supported him, and entered the province of Golconda with 100,000 horse. The French general Bussy and Salabut Jung now took the field to meet these armies, with very unequal numbers, when Ghazee ad Dien Khan suddenly died. The Mahratta generals continued the war, but in every encounter they were repulsed with such fearful loss by the French, that they agreed to conclude a peace on the cession of certain frontier districts, to which Salabut Jung willingly agreed.

In the other point in dispute, namely, the government of the Carnatic, the English espoused the cause of Mahommed Ali, the second son of Anwar ad Dien, who was appointed nabob by Nizam-ul-Mulk; and the French supported Chunda Saheb, the heir of the first deputy Sadatullah, appointed also by Nizam-ul-Mulk. On his death they claimed the right of appointment for Salabut Jung, the subahdar, and who, owing his throne to their powerful support, had become a passive tool in their hands. From him M. Bussy had obtained the cession of the four important provinces of Mustaphanagar, Ellore, Rajamundry, and Chicacole, called the Northern Circars. It was in these circumstances that a suspension of arms was agreed upon in October 1754; and on the 26th of December following a provisional treaty was signed at Pondicherry, by which both parties agreed to abstain from interfering in the internal affairs of the country, and to establish their territorial acquisitions on a principle of equality. These terms were entirely in favour of the English, as they left Mahommed Ali nabob of the Carnatic, and obliged the French also to the cession of the four Circars which they had obtained from Salabut Jung. But this treaty was in truth a dead letter; and the moment it was concluded the English, in virtue of their alliance with the nabob, proceeded to reduce to obedience, and to collect the revenues of the districts of Madura and Tinnevelly. Here, however, they encountered the Colleries, a fierce tribe inhabiting the hilly districts, who obstinately contested every inch of ground; so that they got abundance of hard blows, and little money, scarcely enough indeed to pay the expense of this plundering adventure. The English, when they made their first conquests in India, having conceived vast ideas of its wealth, set no bounds to their rapacity; they were eager to revel in the spoil of the country, and it was only stubborn facts and repeated disappointments that at last dispelled their dreams of avarice. The French, after remonstrating in vain against this conduct of the English, proceeded to follow their example, by reducing to obedience and plundering the petty chiefs of the country.

Whilst the two contending armies were maintaining this predatory warfare, the active and enterprising Bussy was in another quarter securing the ascendency of the French; and, whether in the cabinet or in the field, he still signalized his talents as a warrior and a statesman. Salabut Jung, influenced by his courtiers, had induced the French troops to quit his territories, which order Bussy speedily obeyed, and commenced his march. Finding that he was betrayed, and his progress intercepted by hostile chiefs, he skilfully selected a strong position, which he defended till succours arrived from Pondicherry; when the fickle prince again solicited his alliance, and he was restored to still higher influence than before. Salabut Jung, when he had resolved to dismiss the French troops, had applied to the presidency of Madras for a force to supply their place; and this opportunity of extending their influence would have been eagerly embraced by the English, but their power was now threatened in another quarter, by new and unexpected dangers. Bengal now became the great scene of Indian warfare, in which were concentrated all the resources of the English, from every part of their territories. This extensive province, with Orissa and the province of Allahabad and Berar, was governed, towards the latter end of Aurungzebe's reign, by his grandson Azeem Ooshaun, second son of Shah Aulum, who succeeded to the throne. Jaffier Khan was appointed his deputy; and, as frequently happened during the decline of the Mogul empire, from a deputy he became an independent sovereign. Sujah Khan, who was married to the daughter of Jaffier Khan, was appointed his deputy in the government of Orissa. In this elevated station, a distant relative, Mirza Mahommed, who had once been in the service of Azeem Shah, the second son of Aurungzebe, and had since fallen into poverty, resorted to his court for employment, and he was kindly received. He was followed by his two sons Hadgee Ahmed and Mirza Mahommed Ali, who both obtained employment; and, by their respective talents for business and war, they soon acquired favour and influence in the court of Sujah Khan. Jaffier Khan died in 1725, and was succeeded by Sujah Khan, who supplanted Sereffraz Khan, the destined heir. In 1739 he added to his dominions the province of Bahar, and intrusted its administration to Mirza Mahommed Ali, under the title of Aliverdy Khan. In 1739 Sujah Khan died, and was succeeded by his son Sereffraz Khan, who hated Aliverdy Khan and his brother, and took no pains to conceal it. Aliverdy in the mean time obtaining from the imperial court his nomination to the government of Bengal, collected his troops, and having defeated Sereffraz in a battle in which he was slain, he reduced the country to subjection, and governed it with a regard to justice and humanity very unusual in the East. His reign was, however, one continued scene of commotion, from the irruptions of the Mahrattas, who, though they were often vigorously repelled by Aliverdy and his troops, always returned with new vigour to the invasion of the country. Aliverdy died on the 9th of April 1756, at the age of eighty, and was succeeded by his nephew Suraja Dowla, who had all the vices of a regularly educated prince. His first act was to plunder the sister of Aliverdy Khan, who was reputed to possess great wealth; he gave orders to seize the treasurers of her family, one of whom, however, contrived to escape, and found an asylum in Calcutta. Incensed by the protection given to this fugitive, and jealous besides of the designs and growing power of the Europeans, he took the field on the 30th of May 1756, with an army of 40,000 foot, 30,000 horse, and 400 elephants. The factory at Cossimbazar was seized, and its chief, Mr Watts, and his surgeon, who accompanied him, were retained prisoners. Calcutta was invested on the 18th of June. It was feebly defended, and at last a retreat was resolved upon, which was executed so precipitately that numbers were left behind in the fort by the ships and boats. In this trying situation Mr Holwell was chosen commander, who, seeing no chance of a successful defence, proposed a capitulation in a letter which he threw over the ramparts. In the mean time the troops having gained access to the liquor, were so intoxicated as to be incapable of defence, and the enemy entered the fort without resistance. The subahdar appears on this occasion not to have intended any inhumanity to the garrison; and when Mr Holwell was brought into his presence with his hands tied, he ordered them to be loosed, and pledged his honour as a soldier to him and his companions that not a hair of their heads should be touched. But, notwithstanding these assurances, the tragical scene which ensued has no parallel in the annals of human misery. When night approached, it became necessary to secure the prisoners in some place of confinement; and for this purpose the common prison of the garrison was chosen, which was about eighteen feet square, with only two small windows barred with iron. Into this small apartment the garrison, 146 in number, were compelled to enter, by threats of being instantly cut down if they resisted. Their sufferings from want of air were dreadful, and bribes were offered to the guard to obtain a room for them in which they could breathe. But none dared to awake the sleeping tyrant whose prisoners they were; and, after a night of inexpressible horror, only twenty-three out of 146 were found alive in the morning. The presidency of Madras being apprized of these disasters, determined on sending Colonel Clive, who had now returned to India, to Bengal, with as large a force as could be collected; and an armament accordingly sailed from the roads of Madras on the 16th of October, consisting of five king's ships under Admiral Watson, besides transports having on board 900 European troops and 1500 Sepoys. Having arrived in the Ganges on the 20th of December 1756, they found the fugitives at Fulta, a town at some distance from Calcutta, down the river. The first operation was against a fort; and Clive, lying in ambush to intercept the garrison, was himself surprised by the troops of Suraja Dowla, and, after a conflict long doubtful, extricated himself from the dangers that surrounded him, by that admirable presence of mind which never deserted him in the hour of danger. On the 2d of January 1757, the armament arrived at Calcutta, which surrendered after a cannonade of two hours. Almost the whole property of the Company was recovered, having been preserved for the subahdar; but the houses of individuals were all plundered. On the 10th of January, the city of Hooghly, about twenty-three miles higher up the river, was attacked, and a breach being made, and an assault begun, the garrison sought safety in flight. In the mean time, intelligence was received from Europe of the commencement of hostilities between France and England, which placed in a very critical situation the Company's settlements in Bengal. The English were already engaged in a war with a powerful prince, who had a formidable army in the field; and a coalition with the French, who could muster 300 European troops, with a train of artillery, would have overwhelmed their infant power. Happily for them, the French were desirous of a neutrality, and refused the alliance of Suraja Dowla, who advanced with his whole army and surrounded Calcutta. The perils which now environed the English roused the daring spirit of Clive, and he resolved to surprise the enemy's camp before daylight. But this bold enterprise failed in the execution; the troops suffered severely, and a thick mist augmented the causes of confusion; still the boldness of the design produced the desired effect, by alarming the subahdar, and inclining him to peace. He accordingly concluded a treaty with the English, by which he agreed to restore to the Company their factories, and all their former privileges; to make compensation for the losses they had suffered, and to permit them to fortify Calcutta. The danger which now threatened the Company being averted, the active mind of Clive was directed to other objects; and as war was now declared between France and England, he resolved, in return for the neutrality observed by the French when the English were involved in hostilities with the nabob, to attack their settlement at Chandernagur. This scheme was opposed by the nabob, and was disapproved by the council and Admiral Watson. Reinforcements, however, arriving, the attack was resolved on, and the English force advanced. The French defended themselves with gallantry; and the nabob, alarmed, began to put his army in motion. But the fort was in the mean time reduced by the irresistible fire of the ships. The nabob viewed these proceedings with secret alarm and resentment, and refused to give up the other French factories and subjects in his dominions. He even afforded protection to the fugitives from Chandernagur, and evinced his decided hostility to the English, until he received intelligence of the progress of the Afghans in the north, when he became extremely desirous of peace. But the English were now dazzled with other schemes, and Clive strongly insisted on the rooted disaffection of the nabob to the English, and on the necessity of dethroning him, and of elevating Meer Jaffier, who had married the sister of Aliverdy Khan, to the throne in his stead. It is unnecessary to dwell particularly on the dark intrigues by which this scheme was carried into effect. It was concerted that, for the destruction of Suraja Dowla, the English should take the field; and that Meer Jaffier, who still had a considerable force under his command, should join them at Cutwa. The English, having arrived at Cutwa, found not their expected ally Meer Jaffier; only an intimation from him that he could not join them before the day of battle, but that during the action he would desert the nabob and join his enemies. This intelligence damped the ardour of the English, and it was deemed hazardous to advance further, and to risk a battle, when, "if defeat ensued, no one would return to tell it." But caution at length gave way to bolder counsels; the army crossed the river a little past midnight, at Plassy. Here also was intrenched the army of the subahdar, consisting of 50,000 foot, 18,000 horse, and fifty pieces of cannon. The English force consisted of about 1000 Europeans and 2100 Sepoys. During the battle, which took place on the 23d of June 1757, Meer Jaffier was observed moving off with his troops. Clive, now assured of his intentions, ordered an attack; the subahdar's army was dispersed, and he himself fled from the field with only 2000 attendants. Arriving at his palace, he found no friend on whom he could rely; and disguising himself as a fakir, he escaped, with a favourite concubine and a single eunuch, intending to make his way to the French. But he was discovered at Raje Muhl, dragged back to Moorshedabad, and placed under the custody of Meer Jaffier's son, who gave orders for his assassination. On the 25th of June, Clive arrived with his victorious army at Moorshedabad. Meer Jaffier took possession of the capital, and on the 29th was installed into his high office, in the presence of the rajahs and grandees of the court. Enormous sums were exacted from Meer Jaffier as the price of his elevation; for the Company 10,000,000 rupees, as a compensation for losses; 5,000,000 rupees to the English inhabitants, 2,000,000 to the Indians, and 700,000 to the Armenians; for the squadron 2,500,000; an equal sum for the army; and for the members of the council, which they actually received, namely, for Mr Drake the governor, and Colonel Clive, 280,000 rupees each; and Mr Becker, Mr Watts, and Major Kilpatrick, 240,000 each; the whole amounting to

L.2,697,750. The English, deluded by their avarice, still cherished their extravagant ideas of Indian wealth; nor would they listen to the ungrateful truth. But it was now found that there were no funds in the Indian treasury to satisfy their inordinate demands. They were in the end obliged to be contented with one half the stipulated sum, which, after many difficulties, was paid in specie and in jewels, with the exception of 584,905 rupees.

The Company's servants, whilst their force was so actively engaged in Bengal, were anxious to remain quiet in the Carnatic. In endeavouring to collect the land-rents of the nabob Mahommed Ali, they, however, undertook the reduction of Madura and Tinnevelly; but with no great success, Captain Calliaud being repulsed in an assault on the fort of Dindigul, and another division of the English force at Nelore. The French now resolved to take advantage of the division of the enemy's force, and to strike a decisive blow; and having collected every soldier that could be spared from garrison duty, they suddenly with their whole force invested the fortress of Trichinopoly. On the 14th of May 1757, Captain Calliaud being apprized of their design whilst he was besieging Madura, instantly began his march for the relief of this important place. It was surrounded by an army five times as numerous as his own force, and every avenue to it was strongly guarded. But the English commander, well acquainted with the localities, took his route through a large plain consisting of rice fields covered with water, which was deemed impassable by the French, and therefore left unguarded; and thus he entered the fort. The French general, disconcerted by this successful stroke, drew off his forces and returned to Pondicherry. Having thus secured Trichinopoly, Colonel Calliaud resumed the siege of Madura, and being repulsed, with heavy loss, in an attempt to storm, he turned the siege into a blockade. He was at last received into the town on payment of 170,000 rupees. In the mean time Bussy was eminently successful in all his operations within the Circars; he reduced the fortress of Vizigapatam held by the English; and, after some uncertainty in the unstable councils of Salabut Jung, he finally established an entire ascendency over that prince and throughout the Deccan.

On the commencement of the war between France and England in 1756, the French ministry resolved to send a formidable armament to India; and the Count de Lally, an Irishman, who had left his country with James II., and who had distinguished himself in the battle of Fontenoy, was appointed commander-in-chief of all the French forces in India. Count Lally, with his armament, arrived on the coast of Coromandel on the 25th of April 1757. The English Admiral Pococke had been previously joined by a squadron of five ships of war, and an engagement took place between the two fleets, which terminated to the advantage of the English. Another action took place after the ships were refitted, with the same result. But neither was decisive; and, notwithstanding these successes at sea, the French had a preponderating force on shore, which consisted of 2500 Europeans, and the same number of Sepoys. With this force they commenced, on the 17th of May 1758, the siege of Fort St David. The place capitulated on the 1st of June, and its fortifications were razed. Devicottah surrendered on the 7th of June, and the English now fully expected that Lally would next lay siege to Madras. But the want of money embarrassed all his operations; and in order to relieve his necessities, he undertook the siege of Tanjore. A breach was effected, and preparations made for an assault, when the arrival of the English fleet, after another engagement with the French before Carical, whence the besieging army derived all its supplies, determined Lally to raise the siege; and, after a disastrous retreat, his shattered force arrived on the 28th at Carical. The hostile fleets again encountered on the 2d of August, and after an hour's fighting the French bore away, and were soon beyond the reach of shot. Lally, to relieve his pecuniary wants, which were only augmented by the unsuccessful siege of Tanjore, now prepared for an expedition against Arcot. This place capitulated on the 4th of October, and the French force proceeded forthwith to Chingleput, about forty-five miles south-west of Madras. But the English, aware of its importance, reinforced the garrison, and Lally did not attempt its reduction. His situation was beset with difficulties, from the total want of money and all necessary supplies; and in order to retrieve his affairs, he resolved on the bold enterprise of laying siege to Madras. His force consisted of 2700 European troops, and 4000 Indians. In this attempt he signally failed, with great loss, after continuing the siege from the 16th of December till the middle of February 1759; and this disaster greatly contributed to depress his spirits, and to abate his vain confidence in his own schemes. The French army retreated in the direction of Conjeveram, whither they were followed by the English. Here the two armies manœuvred for some time in sight of each other, when the English marched upon Wandewash, and afterwards on Conjeveram, which they took by assault. On the 28th of May 1759 both armies went into cantonments.

In the end of September the campaign was resumed with spirit by the English, who laid siege to Wandewash, but were repulsed in all their attempts to carry it by storm. But it was attacked and taken on the 29th of October, as was also Caranjoly on the 10th of December. Bussy had been recalled from the Carnatic, where he had exerted himself so advantageously for the French cause, and he joined the army the day after the repulse of the English. Lally had resolved to divide his force; with one part to collect the rents of the southern, with the other to protect what belonged to the French in the northern districts. He contrived by skilful manœuvring to amuse the English, and in the mean time he surprised and took Conjeveram, and thence proceeded to the attack of Wandewash. The English army under Colonel Coote now approached, consisting of 1900 Europeans, 2100 Sepoys, 1250 black horse, and twenty-six field-pieces; and the French general determined to try the issue of a general battle. The French, including 300 marines and sailors, consisted of 2250 Europeans, and 1500 Sepoys. The battle commenced on the 22d of January 1760, at eleven o'clock, and terminated in the total defeat of the French, who lost nearly all their cannon. Lally retreated to Chittapet, about twenty-eight miles from the field of battle, and afterwards to Gingee and Valdore. The victorious general resolved on the reduction of Arcot, and having previously taken Chittapet, he arrived before that fortress upon the 1st of February, and upon the 9th the garrison capitulated. The affairs of the French now rapidly declined. The English had acquired a decided superiority in the field, and fortress after fortress fell into their hands; Tinery on the 1st of February, Devicottah about the same time, and Trincomalee on the 29th. To complete this train of misfortunes, Admiral Cornish arrived at Madras with six men of war; and there being no longer a hostile fleet in the Indian Seas, he readily agreed to co-operate with the land forces. The consequence was, the reduction of Carical on the 5th of April, of Valdore on the 15th, of Chittambaram on the 20th, and about the same time of Cuddalore; and on the 1st of May the whole French force was shut up in Pondicherry, which was their last remaining hope in India, whilst the English forces encamped within four miles of the town. It was in the beginning of September that the English laid formal siege to this place. The batteries were opened about the beginning of December, and it capitulated on the 15th of January 1765; and thus terminated for ever the power of France in this quarter of the world.

Elevation of Meer Cossim to the throne.

Whilst the English were thus establishing their ascendency in the south of India, and also in Bengal, Meer Jaffier, the new nabob, was wholly unable to answer the exorbitant demands of the Company's servants, who, still deluded with the idea of eastern riches, refused to abate one iota of their demands. His situation thus became extremely difficult. His treasury was exhausted, his people impoverished, he had no funds for the expenses of government, and still less for the demands of his rapacious allies. He was compelled to extort money from his ruined subjects by cruelty and terror. He himself, and his son Meeraus, soon fell into universal odium and contempt, from their merciless exactions, and the weakness, negligence, and disorder of their administration. The troops mutinied for want of pay, the rajahs and nobles were discontented, and rebellions multiplied throughout his dominions. The nabobs of Oude and Allahabad entered into a dangerous confederacy with the eldest son of the Emperor Aulumgeer II. for supporting his claim to the imperial throne, and to the subordinate provinces of the Mogul empire; and their combined forces advanced to the invasion of Bengal. But European troops, though few in number, and European counsels, proved an overmatch for the ill-organized masses of Indian cavalry; they were accordingly defeated in every encounter, and Meer Jaffier secured in the undisputed possession of the throne. Lord Clive, who bore so conspicuous a part in these transactions, resigned the government in February 1760; and by his influence Mr Vansittart was raised to be president or governor of the council, consisting of from nine to twelve persons, by a majority of whom the affairs of the Company were now administered. The English, by their prompt and decisive measures, had defended the nabob against foreign aggression; and he had now to defend himself against their own domestic treason, which proved to be the more serious danger. In raising him to the sovereignty they were actuated by purely interested views; and being disappointed, they entered into schemes for dethroning him, and for again selling the throne to the highest bidder. Meer Cossim, married to his daughter, was the person now pitched upon to supply his place. The conditions were, that he should assign to the Company the revenues of the three districts of Burdwan, Midnapore, and Chittagong; that he should pay the balance due by Jaffier; and besides, make a present of five lacs of rupees for the war in the Carnatic. Mr Vansittart now proceeded, with a body of troops under Colonel Calliaud, to persuade, or rather to compel, the nabob to abdicate the sovereignty. At day-break his palace was surrounded with troops, and a letter was sent to him explaining the views of the English, which filled him with rage. He treated with disdain the assurances of safety for his person, and that a reform in his government under his son-in-law as his deputy was all that was proposed; and he finally preferred, rather than sway a barren sceptre, to retire to Calcutta under the protection of the English. Against the deposition of Meer Jaffier several members of the council protested, and this spirit of opposition for a considerable time distracted the English councils. The party who had elevated Meer Cossim highly commended his whole administration, which their opponents were equally solicitous to criticise and to condemn. Meer Cossim was a person of quite a different stamp from his weak and indolent predecessor. By the assistance of his new allies he cleared his dominions of all invaders, and strengthened his frontiers; he reduced the rajahs or independent Indian chiefs, who had rebelled against Jaffier, obliging them to pay the usual tribute, by which means he repaired his finances; he introduced order and economy into his whole administration, and by regular pay secured the discipline and fidelity of his troops. But his conduct was viewed in a sinister light by the members of the council who opposed his elevation; and four of them being dismissed by the directors at home for insubordination to their authority, this faction became the majority; and the most violent amongst them, Mr Ellis, was sent to superintend the factory at Patna, the residence of the nabob, where his whole conduct was one continued insult and defiance of his authority. He made no scruple of seizing and punishing the officers of the nabob, who acted under his express sanction; sometimes throwing them into prison, or sending them in chains to Calcutta, to be there punished at the discretion of the council. To these were added other and more extensive injuries; and at length the usurpations and tyranny of the English were carried to such a height, that the authority of the government either became a mere name, or an instrument of violence and extortion in the hands of the Company's servants. The causes of these disorders, which led to a new and important revolution in the political condition of India, we shall now briefly explain.

Disputes with Meer Cossim.

Cause of these disputes, and oppression of the country.

In India the transit of goods from one place to another was, under the native governments, subjected to a tax; and upon all the roads and navigable rivers toll-houses were erected, where this tax was paid. These toll-houses were multiplied, to the great inconvenience and oppression of the internal trade; and as the duties varied in different places, there was here a wide field for abuse, and the traders were frequently oppressed by the arbitrary extortions of the collectors. The East India Company had, at an early period, procured a firman, which exempted from all internal duties, both the goods which they imported from Europe, as they passed into the interior, and those which they purchased in the interior in their passage to the sea. They were, in fact, protected by a certificate signed by the president or chiefs of the factories, called a *dustuck*, and shown at the toll-houses or chokeys through which they passed. The servants frequently endeavoured to abuse the Company's privilege, by claiming an immunity from taxation for all their own goods, which they had neither imported nor were to export, but which, for the internal supply of the country, they were transporting from one place to another. The subahdars of Bengal, whilst they retained their power, restrained the Company's privilege within its appointed limits, and steadily refused to exempt the trade of its servants from duties to which all others were subject. But when, by the elevation of Meer Jaffier to the throne, the English acquired the undisputed ascendency, they broke through all the equitable restraints imposed upon them; in every district, in every market and village, they dealt in rice, the common food of the people, paddy, betel-nut, oil, fish, straw, bamboos, &c. and, without scruple, used the Company's passport to screen these articles from internal duties; and so dreaded was the English name, that the toll-house keepers no longer exacted the public dues on the transit of their goods through the country. In some cases where the demand was made and the goods stopped, the toll-keeper was arrested by a party of Sepoys, and carried prisoner to the nearest factories; and he was frequently exposed to even greater severities, being tied up and lashed. The confusion into which the country was thrown by the injustice, the violence, and the cruelty, of those rapacious intruders, can scarcely be imagined. The native merchant, still burdened with the heavy duties, which were rigorously levied on him, was undersold in every market; and the Company's servants in a short time engrossed the whole commerce of the country. The unhappy natives were subjected to various other oppressions. It was a common practice of the Company's servants to defraud them both in purchase and in sale; to force goods from them at a lower, and to compel them to buy their own at a higher rate than the market price. Nor did the ordinary tribunals afford any protection against their injustice; a band of foreign adventurers, to call them by no harsher name, had usurped the sovereign power, which they rendered wholly subservient to their own schemes of enriching themselves at the expense of the country.[1]

Just con-
uct of
Meer Cos-
im.

Meer Cossim, the ruler who had been set up by the Company, was extremely displeased with the conduct of their servants, and he represented in the strongest terms to the president and council the enormities to which the private trade had given rise. But the majority of the council were too deeply interested in these enormities to be moved by this just appeal of the sovereign in behalf of his oppressed people. They all participated more or less in the profits of the private trade, and they had no disposition to part with or to restrict this lucrative abuse. They even refused to pay nine per cent. of transit duties upon their goods, though this rate was far inferior to that paid by the native traders; and all that they would agree to was, out of their own liberality and free choice to pay a duty of two and a half per cent. on salt alone. The nabob, when he heard of the proceedings in council, and of the injurious treatment of his officers for duly executing his orders, was naturally filled with indignation; and he came to the resolution of abolishing all internal duties. There could not possibly have been a more moderate or equitable measure. It gave freedom and equality to all parties; it threw down at once all the restraints to fair and open competition, and gave to the Company's servants the unlimited freedom of trade. This just and liberal policy, however, was far from corresponding with their views, and it excited amongst them the most violent clamours. They were discontented at losing so fair an opportunity of amassing enormous wealth. Their conduct, as Mr Mill justly observes, furnishes one of "the most remarkable instances on record, of the power of interest to extinguish all sense of justice, and even of shame." They first insisted on an exemption for themselves from all internal duties, now they cried out in the rage of disappointed avarice against the extension of the same privileges to the inhabitants; and thus they reversed all the usual maxims of fair policy, in seeking immunities for foreigners which were refused to natives.

ants.

The conduct of Meer Cossim, in claiming justice for his oppressed subjects, was highly displeasing to the majority of the council. The exaction of legal dues upon English goods was represented as a violation of the Company's rights, and as evidence of a design to expel them from the country; and, for this new species of treason against the offended majesty of usurped power, it was resolved to depose him, and to replace Meer Jaffier on the throne, as nominal ruler of Bengal, on the well-understood condition of subservience to their views. A treaty was concluded, confirming the immunity which they claimed from all internal duties, with the exception only of two and a half per cent. on the article of salt, whilst those duties were re-imposed on the goods of all other merchants. Large presents were bargained for, and other payments to a great amount, as compensation for losses alleged to have been sustained by the Company's servants, in the course of their illicit interference in the domestic trade. These sums, which at first were estimated at ten, but soon afterwards mounted up to fifty-three lacs of rupees, equal to about L.625,000, were rigidly exacted, whilst large payments to the Company were still undischarged, and the public finances were sinking under the burden of an expensive war, great sums having been borrowed by the Company from its servants, at an interest of eight per cent., and, with all these aids, supplies were wanting both for the war and for the investment, the Company's ships frequently returning, in consequence, half loaded to Europe. Meer Cossim, on his side, saw plainly that matters were fast approaching to the extremity of war, and he made preparations for the contest. He transferred his capital from Moorshedabad, as being too near Calcutta, and under the inspection of the English, to Mongheer, a place 200 miles farther up the Ganges, which he fortified in the best and most expeditious manner. He introduced European discipline among the troops, and he recruited his ranks with all the Armenian, Persian, Tartar, and other soldiers of fortune whom he could collect, and especially with such wandering Europeans or Sepoys as had borne arms in the English service. He substituted European muskets for matchlocks, and formed a train of artillery.

Hostilities with Meer Cossim.

Hostilities commenced sooner than was expected, with the surprise and capture of Patna by Mr Ellis; a violent and rash measure, disapproved by several members of the council. The nabob immediately gave orders to stop several boats laden with arms that had been seized, and released on the representation of the English. Resistance was made, and in the course of the struggle which ensued, Mr Amyatt, a member of the council, and several other Englishmen, were slain. The contending armies now hastened to take the field; and Meer Cossim was overwhelmed by one unbroken series of disasters, which terminated in his dethronement and flight. A division of his army, which had advanced for the protection of Moorshedabad, was totally defeated on the 19th of July, by the English army, which consisted of 650 Europeans, 1200 Sepoys, two troops of native cavalry, and was afterwards joined by a battalion of Sepoys and a hundred Europeans. In advancing to the capital, Major Adam found the enemy strongly posted, with intrenchments fifteen feet high, defended by a numerous artillery. These were stormed, and the city of Moorshedabad was entered by the conquerors. The English, pushing forward, encountered the Indian army on the 2d of August 1763, consisting of 20,000 horse and 8000 foot, in the plain of Gheriah, near Sootie. They resembled European troops in clothing and accoutrements, and in their division into brigades; and the battle that ensued was obstinately contested for four hours. But the discipline and steadiness of the European troops finally triumphed, and the enemy fled, leaving all their cannon behind them. From this time the English were no longer opposed on equal terms in the field. It was only in strong positions and intrenchments that the enemy made a stand. A strong intrenchment at Oodwa was carried on the 5th of September, after it had detained the English for nearly a month; and Mongheer, the last stronghold of Meer Cossim, capitulated, on which he fled into the dominions of the nabob of Oude, and afterwards into the Rohilla country. Irritated by his misfortunes, the nabob wreaked his vengeance on the unhappy English prisoners who were in his power. He had formerly put to death several Hindus of rank who were thrown into prison on account of their wealth; and he now gave an order for the execution of about two hundred English, who had been taken at Patna; amongst others, of Mr Ellis, who had formerly tyrannized over and insulted him, and Mr Lushington, also high in the Company's service. They were invited to an entertainment, and, according to the odious maxims of eastern treachery, were barbarously murdered. A German of the name of Sumroo was the chief agent in this scene of cruelty. Dr Fullarton, who had gained favour

Defeat and flight to Sujah Dowlah.

---

[1] See Ninth Report of the House of Commons on India Affairs; also a Letter of Meer Cossim, dated Backergunge, May 25, 1762, which states that the inhabitants who refused to sell to the Company's servants were flogged or confined.

by his medical services, was the only Englishman who escaped.

Meer Cossim was received in the most friendly manner by Sujah Dowlah, the nabob of Oude, who was far from being well disposed to the English. He considered them as rapacious usurpers, the natural enemies, as they fatally proved to be, of Indian independence, and who, under pretence of commerce, aspired to the dominion of the country. In reply to a letter from the English, threatening, that if he assisted the nabob of Bengal, they would carry the war into his own country, he remonstrated with them on their ambitious views, and on account of the disturbances which they had created in the country; and he added, " to what can all these wrong proceedings be attributed, but to an absolute disregard of the court (of Delhi), and to a wicked design of seizing the country to yourselves. If these disturbances," he continues, " have arisen from your own improper devices, deviate from such behaviour in future; interfere not in the affairs of government; withdraw your people from every part, and send them to their own country; carry on the Company's trade as formerly, and confine yourself to your own commercial affairs." To these reasonable remonstrances, which were repeated in another letter to Major Carnac, the president and council were so far from listening, that they determined upon commencing an immediate and offensive war against him.

War with, defeat, and treaty with Sujah Dowlah.

Major, afterwards Sir Hector Munro, who had arrived from Bombay with a reinforcement, was appointed to the command. His first care was to repress the mutinous spirit which had of late prevailed among the troops, and this he effected by the severe measure of blowing away twenty-four of the ringleaders from the mouths of cannon. He then advanced, with a force of 6215 Sepoys and 856 Europeans, towards the Saone, where the enemy, to the number of 40,000, with a train of artillery, were intrenched in front of the village and fort of Buxar. On the 22d of October 1764, a battle took place, in which the Indian army was completely overthrown, with the loss of about 2000 men. On the side of the British eighty-seven Europeans and 712 Sepoys were either killed or wounded. Major Munro followed up his success, though in two attempts to storm the fortress of Chanda he was repulsed with loss, and it was only through the mutiny of the garrison that it was at length taken by Sir R. Fletcher, who had succeeded to the command. Lucknow, the capital of Oude, was also occupied by the battalions of Sepoys, the fortress of Chunar was attempted, though without success, and that of Allahabad surrendered. Sujah Dowlah was abandoned in his reverses by his ally the Mogul, who concluded a treaty with the English. But he did not yet despair of his fortunes; and having received the aid of a Mahratta force, the combined armies encountered the English on the 3d of May 1765, when they were defeated; and Major Carnac, again attacking them at a place called Calpi, they were overthrown, and driven with precipitation across the Jumna. The vizir, Sujah Dowlah, seeing no hope of retrieving his affairs, resolved to trust entirely to the generosity of the English; and on the 19th of May he surrendered to Major, now General Carnac. The final settlement of terms was reserved for Lord Clive, who had arrived in Bengal, with full powers from the directors, as governor, to regulate all their complicated concerns, whether of sovereignty or of trade. It was agreed that, with the exception of Allahabad and Corah, he should still retain his dominions, which he was judged more capable of defending than the Mogul emperor, to whom they had been promised. For this concession the vizir agreed to pay fifty lacs of rupees as the expenses of the war; but he remonstrated so earnestly against the establishment of factories in his dominions, or any permission to trade free of duties, as the certain cause of trouble, that all such propositions were abandoned. He agreed not to molest Bulwunt Sing, who held the zemindaries of Benares and Gauzeepore, and who had assisted the English in the late contest, and never to afford an asylum to Meer Cossim, or the German soldier Sumroo With regard to the Mogul emperor, he was told, that of the thirty lacs of annual tribute due to him from the subahdars of Bengal, not a rupee would ever be paid; that twenty-six lacs of rupees, which had been assigned him as the revenue of these provinces, would be continued; and that he should receive possession of Corah and Allahabad. In return, the Company received the imperial firman, dated the 12th of August 1765, granting the duannee, or the right of collecting the revenues of Bengal, Bahar, and Orissa, in which is implied, according to the laws and constitution of the Mogul empire, the right of sovereignty; and thus was this body of merchants constituted in form, as well as in substance, the rulers of a vast empire.

Company receives the sovereignty of Bengal.

Maladministration of the Company's servants.

To this issue affairs had been evidently tending for some time past. Meer Jaffier, worn out with anxiety and indulgence, died in the beginning of the year; and Jaffier, his son, was chosen his successor by the Company's servants. From each successive sovereign it was the custom of the electors to exact not only a large donation, but also an extension of power and privileges, so that the native ruler was at length left in possession of little more than a nominal authority. It was now resolved by the English that they should take upon themselves the whole charge of defending the country, and that they would only allow the nabob a few troops for the sake of parade, or for other necessary purposes; whilst, in regard to the civil government, he was to choose a deputy, with the advice of the governor and council, on whom the whole internal administration of the country should be devolved. So completely had the government fallen under the control of the English, that the accountants of the revenue could not be appointed without their approbation. In the mean time the directors were distracted by the contradictory reports of their affairs which they received from India; and it was because they were alarmed by the expensive wars so readily undertaken by their servants, by their rapacious proceedings in regard to the private trade, and by the general embarrassment of their affairs, that they had resolved to appoint Lord Clive to the supreme government of Bengal, conferring on him and a select committee of four, full authority to act and determine all matters, without any dependence on the council; of which authority they were not slow to avail themselves upon all occasions. They also sent along with him a strong representation against the rapacity and tyranny of their servants. In a letter to the governor and council they observe, " Your deliberations on the inland trade have laid open to us a scene of the most cruel oppression." " The poor of the country," they continue, " who used always to deal in salt, betel-nut, and tobacco, are now deprived of their daily bread by the trade of the Europeans, whereby no kind of advantage accrues to the Company, and the government's revenues are greatly injured." The directors accordingly issued the most peremptory instructions for the prohibition of the inland trade of salt, betel-nut, and tobacco, or rather of the monopoly held by the Company's servants, by which the country was so cruelly oppressed. The practice of receiving presents from the native rulers and princes, which had been carried to a great extent, was also prohibited. At a general meeting of proprietors, however, it was urged, in opposition to those wise and salutary restrictions, that the " servants of the Company in India ought not to be deprived of such precious advantages, which enabled them to revisit their native country with independent fortunes."

This reasoning convinced the majority of the proprietors, and a recommendation was moved in consequence to the directors, to re-consider their resolution in regard to the private trade. The governor and council were therefore instructed, after consulting with the nabob, to form a "proper and equitable plan for carrying on the inland trade." (Mill's *British India*, vol. ii. p. 217.) In other words, they were to contrive how they could oppress the country, and yet adhere to the rules of equity. This transaction places in a very strong light the corrupt nature of the local administration. It was admitted on all hands that it was by extortion and rapine, that is, by compelling the oppressed inhabitants both to purchase and sell at prices fixed by the Company's servants, that such profits were gained, and that they were enabled to return to Europe with enormous accumulations of ill-gotten wealth. It was, indeed, as we have just seen, acknowledged by the directors, that the poor of the country were deprived of their daily bread by the trade of their European servants, who monopolized every profitable channel of business; yet, with these facts before them, we find the sovereigns of India delivering over their oppressed subjects to the rapacity of their servants, for the avowed purpose of enriching them with the spoils of the country.

Lord Clive assumed the supreme power in India in May 1765. At this period the servants of the Company, in defiance of the peremptory orders of the directors, still persisted in all the ruinous practices connected with the inland trade; and instead of abolishing these, and thus remedying some of those abuses of which he so violently complained, Lord Clive entered into a partnership for the monopoly of salt, of which large quantities were accordingly purchased, and sold for a profit of forty-five per cent., which was divided amongst three of his own dependents, his secretary, surgeon, and another friend, for whom he wished, as he expresses it, to realize a fortune. The plan of a more extensive monopoly, including salt, betel-nut, and tobacco, the chief articles of consumption in the country, was afterwards devised to be carried on exclusively for the benefit of the superior servants of the Company, amongst whom the profit, after setting apart L.100,000 per annum to the Company, was to be divided according to their rank in the service. At the time this corrupt scheme of monopoly was established, the select committee were in possession of peremptory orders from the directors for its abolition; but these orders, under various pretences, they delayed to carry into execution till September 1768.

Although the ascendency of the English had for some years been thoroughly established in Bengal, and although they were formally invested in 1765 with the sovereignty of the country, its affairs were still administered in the name of the native prince, and according to the forms and policy of the ancient constitution. Justice was still dispensed by the native courts, and by the nabob's officers; the revenues still flowed through the same channels into the public exchequer; and all transactions with foreign powers were carried on under the same authority as formerly. But such was the increasing power of the English, that the government, as far as regarded the protection of the people, was dissolved. Neither the nabob nor his officers dared to offer any opposition to their sovereign will; and the tribunals of justice, far from being a protection to the oppressed, became subservient to the rapacity of the Gomastahs, or Indian agents, employed by the Company's servants, and were converted by them into most efficacious instruments for plundering the people, and for punishing the wretched victims of their oppression if they dared to complain, and if they did not patiently submit to be fleeced and trampled upon by their foreign masters. The native tribunals had no power to afford protection, whilst the English had no legal authority beyond the presidency, either over the natives or over their own subjects; and hence the inhabitants lay entirely at the mercy of the Company's servants. Nor need we wonder that, during this period of anarchy and disorder abroad, the embarrassments of the Company's affairs continued to increase, even during the peaceable administration of Mr Verelst, who succeeded Lord Clive as governor when he left Bengal in February 1767. The Indian revenues were indeed large, but they were plundered by their servants. Lord Clive and the first adventurers were enriched by the presents or bribes of the native rulers. These they were now prohibited from accepting. "It was expedient for them," says Clive, "to find out some other channel, the channel of the civil and military changes. Every man now who is permitted to make a bill makes a fortune." In lieu of the enormous gains which accrued from the monopoly of salt and of other articles, the trade which the directors, early in 1768, sent peremptory orders to lay open, and also of one eighth per cent. of the revenues given to the governor, as a compensation for his share of the salt monopoly, the Company granted a commission of two and a half per cent. on the revenues. This sum was to be divided into a hundred shares, and to be distributed amongst the civil functionaries of the Company, and the military officers, according to their rank.

Embarrassments of the Company at home.

Whilst the local rulers of India were thus enriching themselves, their masters were reduced to great pecuniary distress. But, in the midst of all their embarrassments, the most flattering accounts of their affairs were circulated in Europe; and the directors and proprietors lent a willing ear to these golden promises, of which their servants were always liberal. The splendid acquisition which the Company had made of the territorial revenues of Bengal, the political events in which they had been involved, and the immense fortunes with which a few individuals had returned to Europe, confirmed the general delusion, and inflamed the impatience of the proprietors of East India stock to participate in the inexhaustible treasures of their new dominions. In pursuance of these views, the dividend on their stock was raised from six to ten per cent.; and India stock rose to 263 per cent. A higher dividend was called for, and it was in vain that the directors represented the heavy debts of the Company, and the general embarrassment of their affairs. The proprietors refused to listen to such disagreeable representations, and at a general court they voted a dividend of twelve and a half per cent. for the year 1767. The attention of government being now directed to the Company's affairs, this vote was rescinded by act of parliament, and the dividend limited to ten per cent.

In the mean time, every day's experience was refuting the fallacious expectations of annual treasures from India. So far from possessing any surplus revenue, the servants were involved in debt for the current expenses of their government; they drew largely on the directors, but they remitted little; and the whole of this complicated scheme of trade and sovereignty laboured in consequence under such pecuniary difficulties, that the directors, to avert a public bankruptcy, were compelled to apply to the bank for a loan of L.400,000, and afterwards of L.300,000. In consequence of this state of things, so different from the pleasing fancies of unbounded wealth, with which the proprietors of the Company and the country at large had been amused, great discontent and a violent clamour was raised against the Company's servants in India, who by their profusion or corruption had failed to realize those golden dreams. The situation of the Company was at length brought under the consideration of parliament by the minister, who introduced two acts for the regulation of their affairs. The first of these was intended to relieve the pecuniary embarrassments of the Company, and provided that the sum of L.1,400,000 per annum, at four per cent. should be lent to them, and that the stipulated annual payment of L.400,000 from the territorial revenue should not be required till the discharge of this debt; the dividend not to exceed six per cent. till the discharge should be accomplished, and not to exceed seven per cent. till the bond debt should be reduced to L.1,500,000. Other clauses related to the appropriation of the surplus revenue, which was always fondly hoped for, but never received. The other act, which was heavily complained of as an infringement of the Company's rights of sovereignty, as the first was said to be an invasion of their rights of property, raised the qualification to vote in the court of proprietors from L.500 to L.1000; gave two votes to every proprietor possessed of L.3000; three votes to those possessed of L.6000; and four votes to those possessed of L.10,000; and only six directors, instead of twenty-four, the whole number, were to be annually elected; and the administration of the provinces of Bengal, Bahar, and Orissa was to be vested in a governor-general with an annual salary of L.25,000, and four councillors with a salary of L.10,000 each. The other presidencies were rendered subordinate to that of Bengal; and a supreme court of judicature was established at Calcutta, consisting of a chief-justice with L.8000 a year, and three other judges with L.6000 a year, appointed by the crown. The first governor-general and councillors were to be appointed by the king; and all the political correspondence of the Company with India was to be laid before the ministry. These acts received the royal assent on the 21st of June and 1st of July 1773. Under this act Mr Hastings was appointed governor-general, with General Clavering, Colonel Monson, Mr Barwel, and Mr Francis, members of council.

Affairs of the Carnatic.

It will now be proper to revert to the affairs of the Carnatic. After the departure of Bussy from that province, and the decline of the French influence, Nizam Ali resumed his power, which he employed in dethroning and imprisoning, and afterwards murdering, his feeble brother Salabut Jung, the subahdar of the Deccan. The English having received from Shah Aulum, the Mogul emperor, a grant of the Northern Circars, a tract extending 470 miles along the coast of the Bay of Bengal, and uniting the English possessions in the Carnatic with their province of Orissa, proceeded to occupy it with a military force. On this Nizam Ali, or the Nizam as he is called by the English, made an irruption into the Carnatic, and greatly alarmed the presidency of Madras. After some operations of little moment, a treaty was concluded, by which the English agreed to pay a rent for the disputed territory, and to give him such military aid as he should require in the affairs of his government. The first operation in which this force was to be engaged was the reduction of the fortress of Bangalore, belonging to Hyder Ali, the sovereign of Mysore; and thus were the English brought into collision with that powerful chief. He was one of those bold spirits who rise to eminence in times of civil confusion. From a common foot soldier, or peon, employed in the collection of taxes, he rose to high command, to wealth and dominion, and finally to the rank of sovereign prince. The nizam, who had joined with the English against Hyder, soon became his ally, and their united forces made incursions into the Carnatic. Several battles were fought to the disadvantage of Hyder, but these were of little advantage to the English, owing to his superiority in cavalry, with which he laid waste the country to the very gates of Madras, and struck terror into the president and council. The nizam, however, wearied of the war, quitted the alliance of Hyder, which so elevated the confidence of the Madras presidency that they resolved on the invasion of Mysore. But Hyder anticipated their designs, and having by his masterly tactics artfully drawn the English army to a distance from Madras, he suddenly appeared at the head of 6000 cavalry before that city, having marched 120 miles in three days, and so alarmed the presidency, that a treaty, offensive and defensive, was concluded in April 1769, by which it was also agreed that all conquests should be mutually restored.

Destruction of the Rohillas.

At this time the Mahrattas, humbled for a time by the defeat of Paniput, now began to renew their incursions into the northern provinces, and greatly to the alarm of the subahdar of Oude, who dreaded any confederacy between them and the Rohilla chiefs or Afghans, a hardy race from the north, who having frequently aided the imperial armies, were rewarded with lands in the fertile district between the Ganges and the mountains, and to the west of the Oude territories. One of their chiefs, Nujeeb ad Dowlah, had been chosen by Abdallee Shah, on his departure from Delhi, after the battle of Paniput, as the imperial deputy. He had ruled the country with singular prudence and success, and had transmitted the government to his son, Zabita Khan, against whom a coalition was now formed by the Mahrattas and the fallen emperor Shah Aulum, anxious to regain his former power. By their assistance the emperor, in the year 1771, entered his capital of Delhi, with all the pomp of imperial dignity. Zabita Khan, unable to withstand their united attack, fled across the Ganges, leaving his fertile and flourishing territories to the devastations of the Mahrattas, to whom they afforded a rich booty. The Rohillas, alarmed by this aggression, proposed to form an alliance with the subahdar of Oude, who on his side was equally dismayed; and through the intervention of the English a treaty was accordingly concluded, offensive and defensive, by which the Rohillas engaged to pay annually to the subahdar forty lacs of rupees if he would expel the Mahrattas from their territories. He made no effort, however, to perform this service; and the Mahrattas, after retiring across the Ganges during the rains, soon returned to ravage the country, and actually extorted a sum of money from Hafiz Rhamet, chief of the Rohillas, as the price of their retreat. In 1772 they besieged the emperor, who had become weary of their alliance, in Delhi; and having entered the city, they extorted from him a grant of the two provinces of Corah and Allahabad, which he held by virtue of a treaty with the English. The subahdar was now really alarmed, and wrote the most pressing letters to the English for aid. A detachment was accordingly sent under Sir R. Barker, to assist in the defence of his territories, when the Mahrattas were recalled to their own country about the end of May 1773. The subahdar, freed from danger, now became ambitious in his turn, and was intent, either by force or fraud, upon gaining possession of the Rohilla country. With this view, in a meeting with Mr Hastings in October 1773, it was agreed that the English troops should assist in the conquest and extermination of the Rohillas, and that forty lacs of rupees should be paid for this service. In fulfilment of this iniquitous compact, the united forces, the British under Colonel Champion, entered the Rohilla territories in 1774, and on the 23d of April a battle was fought, in which the unfortunate Rohillas, after an obstinate defence, were defeated, and their gallant chief Hafiz Rhamet, slain while rallying his troops; the subahdar and his army, in the mean time, behaving with shameful pusillanimity. The whole country now lay at his mercy, and he proceeded to execute his diabolical purpose, which, as he had expressly informed the English, was the *extermination* of the Rohillas. Never, probably, says Mr Mill, were the rights of conquest more savagely abused; man, woman, and child were given up to the destroying sword, and the country was reduced to a desert.[1] At length it was agreed that Fyzoolla Khan, the remaining chief of the Rohillas, should surrender one half of all his effects to the subahdar or the vizir, and should receive in Rohilcund a jaghire of fourteen lacs and 75,000 rupees. With regard to the Mogul emperor, the twenty-six lacs of rupees hitherto paid to him as his share of the revenues of Bengal, Bahar, and Orissa, were withdrawn, because he had accepted the aid of the Mahrattas in his late attempt to regain the throne of his ancestors. He was also deprived of the provinces of Corah and Allahabad, granted to him in terms of a former treaty with the Company.

[1] *History of British India*, vol. iii. p. 509.

Sketch of the Mahratta powers.

On the west coast of India, the presidency of Bombay was at this period involved in disputes, which ended in a war with the Mahratta states; and, with a view to the subsequent history of India, it may be necessary here to give a brief account of these disputes, and of the different Mahratta powers who had now risen to political importance in India. In the Mahratta government, as originally constituted, the sovereign or rajah was assisted by a council of eight Brahmins, the chief of whom bore the title of peshwa; and in course of time this principal minister of state, on whom devolved the duties of government, usurped all the real power, and the sovereign became a mere pageant in his hands. In the reign of the rajah Sahoo, the third in succession from the brave and politic Sevajee, the founder of the Mahratta power, this revolution had been insensibly brought about. He was a weak prince, devoted, as most princes are, to ease and pleasure, and leaving to Kishwanath Balagee the chief powers of the state. He assumed the name of Row Pundit, or chief of the Pundits, or learned Brahmins, and was invested by the rajah with a *sirpah* or robe of office, with which ceremony the peshwas have ever since been installed into their sovereign dignity. Custom or policy had so completely sanctioned the usurpation of supreme power by the peshwa, that Kishwanath had quietly transmitted his dignity and influence to his son Bajerow, who confined the rajah as a sort of state prisoner to Satarah, whilst he himself resided at Poonah, the future capital of the Mahratta states. Bow, the son of Bajerow, being slain at the battle of Paniput, the office of peshwa descended to his nephew, who had two sons, Madhoo Row and Narrain Row, the eldest of whom, Madhoo Row, a minor, succeeded to his father's dignity at his death, and the guardianship of the peshwa now devolved on Ragonaut Row, more commonly known under the name of Ragoba. The council of state, consisting of the Brahmins, now made an effort to regain their lost influence; and intriguing with the mother of the peshwa, they succeeded in sowing division between the nephew and the uncle, and finally in stripping him of his power. Madhoo died at an early age in 1772, and appointed Ragoba to be the guardian of his brother Narrain Row. But he was by the same influence again stripped of his power; and dissensions having arisen amongst the council of Brahmins, or Mutseddies as they are also called, a conspiracy was formed, which ended in the murder of the young prince, when Ragoba was again acknowledged peshwa. But he was still thwarted by the ministerial factions of the Brahmins, and the consequence was a civil war, which was carried on with various fortune, but terminated at length in the flight of Ragoba from his dominions. The presidency of Bombay had been extremely anxious to procure the cession of the island and peninsula of Salsette and Bassein, as adding much to the security and value of Bombay. But all their efforts were in vain. Ragoba uniformly refused to give them up on any terms. He had now retreated to Surat; and in the low state of his fortunes the negotiation was renewed. In the mean time the presidency were informed by their resident at Goa that the Portuguese were making preparations for the recapture of their former possessions, especially of Salsette and Bassein. No longer hesitating, they sent a force from Bombay, which carried by assault the principal fort in Salsette on the 28th of September 1774, and afterwards took possession of the island; in March 1775 they concluded a treaty with Ragoba for the surrender of these places, with other advantages; and in return they sent a body of troops under Colonel Keating, which joined his army in April, about fifty coss from Cambay; and this combined force, amounting to 25,000 men, now advanced for the purpose of penetrating to Poonah before the commencement of the rains. The enterprise failed for the present, but the armies were quartered in convenient positions; and having concluded a favourable treaty with the rajah of Gujerat, who had agreed, amongst other conditions, to advance the sum of twenty-six lacs of rupees, they prepared, with a friendly country in their rear, and greatly increased resources, to advance to Poonah the next campaign. But all these promising schemes were now frustrated by the interference of the Bengal council, which had been invested with supreme authority over the other settlements in India; and the alliance formed by the presidency of Bombay with Ragoba, the peshwa, and indeed all the other proceedings, were severely condemned by the governor-general and his council. The council at Bombay were ordered peremptorily to retrace their steps, to withdraw their troops from those of Ragoba, and to give him no further aid; and they themselves proceeded to treat, by means of their own agent, Colonel Upton, with the opposite faction of the Brahmin ministers. A long and perplexed negotiation now ensued, which had nearly ended in war, when a treaty, that of Poorunder, was signed on the 3d of June 1776, by which the Mahratta ministers agreed to surrender Salsette, and the English Bassein; and the unfortunate Ragoba finally retired to Surat with only two hundred attendants.

War with the Mahrattas.

The Mahratta power, which was spread far and wide in India, was now weakened by the same divisions which had occasioned the downfall of the Mogul empire. All indeed acknowledged their allegiance to the peshwa, the representative of Sevajee, their founder, and the nominal head of the whole confederacy. But there was no unity in the component parts of their wide-extended empire. They no longer obeyed one common impulse. The military chiefs to whom were confided the more distant provinces threw off the yoke of sovereign authority, as it was gradually relaxed; and thus, from the extension of the Mahratta power, arose various independent potentates, who, though united by a common tie, yet waged war with each other, or with the peshwa, their head, on any provocation or prospect of advantage. The most important of these independent states was, 1*st*, that of the Bhonslas, which included the extensive province of Berar, together with Cuttack, a part of Orissa; 2*d*, the province of Gujerat, broken off from the Mogul empire by Pillagee Guicowar, or the herdsman; 3*d*, the independent chiefs, Holkar and Scindia, whose names figure in the future annals of India, and who ruled over extensive territories in Malwah and in the regions bordering on the territories of Berar and Oude. Other inferior chiefs, offsets from the main stock, possessed smaller portions of territory in different parts; and the internal relations of Hindustan were thus more than usually complicated, and presented a wide field for politics and intrigue.

Oppression of the native princes.

The presidency of Madras, as well as the other two presidencies of Bengal and Bombay, were now deeply involved in the disputes of the native powers. The nabob of the Carnatic, Mahommed Ali, was incapable of ruling or of defending his country against the Mahrattas or Hyder Ali, and he relied entirely upon the English for protection and for the collection of his revenues. The disorder of his finances, already great, was much increased by the extortions of his allies, who were insatiable in their thirst of gold; and funds failing, as in Bengal, to supply their exorbitant demands, they anxiously sought elsewhere the means of relief. The kingdom of Tanjore, by the prudence of its sovereign, had enjoyed peace amidst the wars and desolations of surrounding countries; his powerful neighbours, supposing that he had amassed great wealth, mustered up against him a world of complaints, of which he readily showed the futility; and when he saw that his ruin was resolved on, that he was to be stripped of his dominions, and that he and his family were to be put to death or imprisoned for life, he pleaded for mercy with the most affecting earnestness; but avarice had extinguished every softer feeling in the breasts of his oppressors. The troops were ordered to advance; the rajah agreed to terms which he could not fulfil; and failing to pay within the exact time which the contribution imposed upon him, though he made the fairest offers, Tanjore, his capital, was taken by assault, and he and his family were delivered into the power of the nabob. This act of oppression, encouraged at first by the directors, was afterwards disapproved by a court of proprietors; and Lord Pigot was sent out as governor of the presidency, to restore the rajah, and to enforce economy and reform. The corrupt and dishonourable practices of the Company's servants were nowhere carried to a greater length than at Madras. They were in the habit of lending, or pretending to lend, money, to the nabob, at an exorbitant interest, and to receive in security assignments on the land. Paul Benfield, with a salary of some hundred pounds a year, had assignments on the lands of Tanjore to the amount of L.234,000; and Sir Thomas Rumbold, with a salary of L.20,000 a year, remitted to Europe the first year he was in office L.45,000, and in the two subsequent years a further sum of L.119,000, alleging that he had property to this amount in India before he left Europe. The lands belonging to the Company were let at an under rate to the renters, and large bribes received in return; and it was by such unworthy means that the servants of the Company so quickly acquired their enormous fortunes. Lord Pigot, in carrying into effect the views of the directors, by restoring the rajah of Tanjore, and opposing the existing abuses, was resisted by a faction. He was at last put under arrest by the members of his own council, and died after a confinement of about eight months. The authors of this violence were afterwards tried in England, and condemned to pay a paltry fine of L.1000, which was no adequate punishment for such an offence, and, to men of their fortunes, no punishment at all.

Invasion of the Carnatic by Hyder Ali.

The growing ascendency of the English naturally excited the hostility of the native powers; and Hyder Ali, irritated by their increasing influence, and by their breach of the treaty of 1769, in refusing the aid which he demanded, was now preparing to assail them with the whole weight of his power. He accordingly made peace with the Mahrattas, who formed, with the Nizam Ali and Hyder, a coalition for the expulsion of the English from India. In the year 1778, war having commenced in Europe between France and England, the presidency of Madras besieged and took Pondicherry, and Mahé, a small fort, the only remaining possession of the French on the coast of Malabar, and ranked by Hyder amongst his dependencies. Irritated by this new offence, he assembled his army, and having seized and guarded the passes of the Eastern Ghauts, through which alone the Carnatic would be invaded from Mysore, he suddenly poured down on the country below with a mighty host of 100,000 cavalry and 20,000 infantry, besides the European troops of Colonel Lally, of undoubted bravery and experience in war. Every thing gave way before this overwhelming flood of invasion; and the cavalry inundating the open plains, the inhabitants fled from their homes to the woods or the mountains, whilst the unresisted invader laid waste the country with fire and sword for many miles round Madras, and even threatened the city itself. The council were confounded by the intelligence of this sudden calamity. They were apprized on the 21st of July that Hyder had come through the pass, that he had next day plundered Porto Novo on the coast, and Conjeveram, not fifty miles from the capital. Each succeeding day brought its tale of calamity, and on the 10th of August Madras was alarmed by the approach of the enemy's horse, and the inhabitants of the open town began to take flight. The governor and council were very indifferently provided for the fearful struggle in which they were engaged. They were destitute both of money and provisions; their small force was scattered throughout the country; and, lastly, their councils were distracted by the dissensions of the civil and military authorities. Immediate action, however, was necessary, in order to avert impending ruin. The scattered troops were therefore directed to assemble at St. Thomas' Mount, for the defence of the capital. Colonel Brathwaite's detachment from Pondicherry having joined the main body on the 18th of August, an express was sent to Colonel Baillie at Gumeroponda, about twenty-eight miles from Madras, directing him to repair to Conjeveram, whither the main army now advanced under Sir Hector Munro, consisting of 1500 Europeans and 4200 Sepoys, with a train of artillery, and arrived after a distressing march of four days, during which two hundred men belonging to the seventy-third regiment were left lying on the road. They found the town of Conjeveram in flames, large bodies of the enemy's cavalry advancing on both flanks, and no appearance of Colonel Baillie's detachment, which had been impeded in its march for a day by a small torrent swollen with the rains. Hyder Ali having learned from his spies the movements of the English army, abandoned the siege of Arcot, in which he was engaged, and, upon the 3d of September, the day on which Baillie's detachment crossed the river in its advance to the main body, he encamped at five miles distance in front of the English army, near Conjeveram; thus interposing between Colonel Baillie's detachment and the English forces; and he sent his son Tippoo with 30,000 cavalry, the flower of his army, and 8000 foot, with twelve pieces of cannon, to cut off the troops under Colonel Baillie, who had now arrived at a small village about fifteen miles distant from Sir Hector Munro's army, the movements of which he himself watched in the neighbourhood of Conjeveram. The troops under Colonel Baillie gallantly repulsed the repeated charges of Tippoo's numerous cavalry; and being now joined by a detachment under Sir R. Fletcher, sent to their aid by General Munro, they resisted long and bravely all the attacks of the overwhelming force by which they were surrounded; they even at times became the assailants; and an attack by five companies of Sepoys on the enemy's guns, which had begun to do great execution, spread amongst them such terror and confusion, that a seasonable and bold assault of their camp would, it is thought, have completed their route. The English commander maintained the same position till next morning, for which he has been much blamed; and when, at five o'clock, he began the day's march, he was assailed by the whole army of Hyder, who had left his ground without shifting his tents, to conceal his design. Colonel Baillie, with his handful of men, still maintained his ground in spite of the enemy's superior fire and the fury of his closer attacks, when, by an accident, the blowing up of two tumbrils, the English line was not only disordered, but the ammunition was destroyed, and the guns disabled. But though their fire was now silenced, they maintained a gallant resistance till three o'clock in the morning, when the commander, Baillie, despairing of relief, sent a flag of truce to the enemy; and the men having laid down their arms on receiving a promise of quarter, Hyder's troops rushed on them with savage fury; and, but for the humane inter-

Colonel Baillie's detachment cut off.

position of the French officers, would have massacred all who survived. After this disaster, Sir Hector Munro retreated to Madras, whilst Hyder returned to the siege of Arcot, which was taken by storm on the 31st of October, with an immense quantity of ammunition and military stores.

Progress of the war with Hyder Ali.

On the intelligence of Colonel Baillie's disaster, the supreme council of Bengal requested Sir Eyre Coote to take the command of the army in the Carnatic; and on the 17th of June 1781, the English force, consisting of 7000 men and 1700 Europeans, marched from the encampment at Mount St Thomas. Hyder now changed his plan of operations, and detached different divisions of his force against the strong places of the Carnatic. But he was so overawed by the arrival of a new commander with reinforcements, that he abandoned the siege of Wandewash, and of every place which he had invested, and retired without even disputing the passage of the Palaar. The English took the opportunity of this short respite to secure possession of Pondicherry, and to disarm the inhabitants, who had revolted. Hyder having received large reinforcements, resumed the offensive; and as the plan of the English was to march southward to protect the district of Tanjore and Trichinopoly, he resolved to oppose their advance to Cuddalore. A battle was fought on the 1st of July 1781, in which Hyder was driven from his strong position with great slaughter. On the 27th of August, another battle was fought on the ground where Colonel Baillie's disaster had occurred, when he was again defeated, after an obstinate action, in which the English suffered severely; and, some weeks afterwards, he experienced a third defeat, with greater loss than before. Far from being discouraged, this warlike prince proceeded to lay siege to Vellore, eighty-eight miles south-west from Madras. Sir Eyre Coote, though he had placed his army in cantonments, advanced to its relief, and forced his way through a strong pass guarded by the enemy's force. Returning by the same pass, he was again attacked at a disadvantage with the utmost vigour; but Hyder's cavalry suffered so severely from the English artillery that he retired with loss, while Sir Eyre Coote returned to his cantonments near Madras. Whilst the war was thus carried on with doubtful success in the eastern districts of the Carnatic, hostilities now commenced on the opposite coast of Malabar. The English detachment, by which the French settlement of Mahé was captured in 1779, had since that period occupied the fortress of Tellicherry, when it was besieged by a superior force of Hyder's tributaries. Major Abingdon, the commander, having received a reinforcement from Bombay on the night of the 7th January 1782, assaulted the enemy's lines, and threw their whole army into confusion; and he soon afterwards gained possession of Calicut. Here he was joined by Colonel Humberston Mackenzie with a thousand Europeans, and offensive operations were undertaken with vigour and success, when the army returned in May, as the rainy season approached, to its cantonments at Patacalah, in Calicut. Operations were resumed in September with the reduction of a strong fort, and the army had arrived at Palacatcherry, when, being surprised in a narrow defile, the whole baggage and ammunition was captured. A retreat to the coast was the only alternative now left to the English, in the course of which they were attacked from every thicket, both on their flank and rear, and harassed in their march, by 20,000 horse under Tippoo. Arrived at the town of Paniany, on the Malabar shore, their lines were assaulted by the enemy's force in four columns, including Lally's corps, when the forty-second regiment advancing to the charge, repelled the enemy. Tippoo now hearing of his father's death, immediately departed to take the necessary measures for securing his succession to the throne.

In the south of the Carnatic a French fleet landed 2000 men at Porto Novo early in 1782; and Tippoo having arrived with a large detachment from Hyder's army, by a brilliant and successful movement surrounded Colonel Brathwaite's force, consisting of a hundred Europeans, five hundred Sepoys, and three hundred horse, encamped upon the Coleroon, before there was the smallest suspicion of his march. Forming a hollow square, this little band held out for twenty-six hours, and repulsed every attack, until, exhausted with incessant conflict, they were at last broken by a charge of the French under Lally, and would have been all massacred as formerly, but for his vigorous and humane interference. Hyder was now enabled, by the succours he had received from France, to invest Cuddalore, which quickly surrendered, when he determined to undertake the siege of Wandewash. Its importance brought the army of Sir Eyre Coote to its relief, when Hyder still declined the hazards of a battle. The English general then proceeded to the attack of Arnee, the great depository of the enemy's warlike stores and necessaries. But Hyder outstripping the slow movements of the English force, hung upon their march; and, whilst they were galled by the attacks of his cavalry, he dexterously detached a division of his army, which carried off all his treasure from Arnee, and reinforced the garrison. In the retreat to Madras, after these operations, a regiment of European cavalry, drawn into an ambuscade by the skilful tactics of the enemy, was either killed or made prisoners. Whilst the English army was cantoned in Madras, Hyder, ever active and enterprising, was concerting with the French admiral an attack on Negapatnam, a settlement of the Dutch, which had been conquered by the English at the commencement of the Dutch war in 1780. But the French fleet having been brought to an action by the English, was prevented from co-operating in this well-planned enterprise. On the return of the army to Madras, Lord Macartney, who had arrived as governor in December 1781, now concerted a plan for the recovery of Cuddalore. But the admiral steadily refused co-operation in this, or apparently in any other operations of the land forces. On the 15th of October, one of the most dreadful tempests ever known occurred at Madras; the shore was in a short time strewed with the wreck of a hundred trading vessels, and famine raged in the city, multitudes daily perishing for want. The enemy had fortunately no information of the helpless and starving condition of the place, and considerable supplies of provisions were received from Bengal and the Circars. Hyder Ali died in December 1782, at the age of eighty years; and this event produced a great and favourable change of affairs. The Mahratta war, undertaken in favour of the claims of Ragoba to the dignity of the peshwa, which had continued since 1778, was now also concluded by a peace. The capitulation by which a British force that had invaded the Mahratta country surrendered, having been violated, the Mahrattas joined the confederacy against the English. But by the great successes of General Goddard, who, in the course of three months, from January 1780, had reduced the province of Gujerat, and completely defeated Scindia, the Mahratta general, they were now detached from the alliance of Hyder, the great enemy of the English.

Tippoo, after he joined his army in the Carnatic, undertook no operation of consequence, and he was recalled to the defence of his own territories, which were assaulted by the enterprising movements of the English armies, both from the west and from the south. About the beginning of January 1783, a force concentrated at Merjee, on the western coast of India, about 300 miles north of Paniany, under General Mathews, after storming the forts of Onore, Aranpore, and Mangalore, on the sea coast, with the slaughter of every man taken in arms, laid siege to Bednore, a rich capital of one of the Mysore provinces, which soon surrendered. A vast treasure, amounting to L.800,000 in pagodas, besides jewels, was found in this place, which immediately occasioned disputes, in consequence of the general refusing to divide the booty among the captors. He was on this account superseded by the presidency, and the command given to Colonel Macleod. But the hope of spoil appears to have corrupted the virtue of the army, which was dispersed in plundering detachments over the country, when Tippoo suddenly took possession of Bednore, making prisoners of the English garrison, which capitulated, with General Mathews, and sending all of them in irons to the strong fortresses of Mysore. Mangalore was next besieged, and taken after a gallant resistance, on the 23d of January 1784. In the mean time Colonel Fullarton, who commanded a force in the Southern Carnatic, having reduced to order the districts of Madura and Tinnevelly, and taken, in April, May, and June, the forts of Caroor, Dindigul, and Daraporam, advanced to the strong fortress of Palacatcherry, which surrendered after a short siege. Coimbetore was taken possession of in November, and every preparation was made for advancing to Seringapatam, and terminating the war by the capture of the enemy's capital, when a treaty was signed on the 11th of March 1784, upon the general basis of a mutual restitution of all conquests.

The state of affairs in Bengal under the administration of Mr Hastings now claims our attention, and we shall endeavour briefly to describe the leading transactions of that memorable period. The new council, to whose care was committed the administration of India, and of which Mr Hastings was president, commenced its deliberations in October 1774, with an inauspicious appearance of mutual coldness and jealousy, which quickly broke out into open dissension. The Rohilla war was the first subject of deliberation, and it unhappily afforded too good grounds for doubt and for inquiry. Other subjects succeeded, equally difficult to handle without offence, as they involved the governor in a suspicion of corruption in the business of the revenue. The rannee of Burdwan, a widow who enjoyed an extensive district, accused her agent the duan of corruption, and the English resident of being bribed to support or to connive at his iniquities. In the accounts that were presented to the council, a sum of 15,000 rupees was charged to Mr Hastings, and 4500 to his native secretary. Another accusation of the same nature was preferred by one of the natives, namely, that the phouzdar of Hooghly, out of the salary of 72,000 rupees which he received from the Company, returned 36,000 to Mr Hastings, and 4000 to the native secretary; and Mr Grant, accountant of the provincial council of Moorshedabad, produced a set of accounts, from which it appeared that Munny Begum, a concubine of the late Meer Jaffier, who had been appointed to the guardianship of the nabob by Mr Hastings, had received 967,693 rupees[1] more than she had accounted for; and when pressed on this subject, she told that she had given 150,000 rupees to Mr Hastings for entertainment money, which was at the rate of L.73,000 per annum, and the like sum to Mr Middleton, the agent of Mr Hastings. A still more serious charge was brought forward by the rajah Nundcomar, who had been the agent of Mr Hastings in the prosecution of Mahommed Reza Khan, duan or manager of the revenues of Bengal, whose embezzlements, as well as those of Shitabray, he now accused the governor-general of overlooking; and further exhibited the particulars of a sum of 354,105 rupees, which he affirmed that he had accepted for the appointment of Munny and Goordass to their respective dignities and powers. In answer to these accusations, Mr Hastings chiefly pleaded his dignity as governor-general. He resented them as personal insults; and when it was proposed to inquire into them by the other members of the board, he lost all calmness, and accused them of a design to supersede him in his office. "I declare," he said, "that I will not suffer Nundcomar to appear before the board as my accuser. I know what belongs to the dignity and character of the first member of this administration. I will not sit at this board as a criminal." After this he dissolved the council, in virtue of a power which he assumed as president. The majority declared the dissolution void, and continued the inquiry, when Nundcomar declared the particular sums which he himself had paid to the governor-general, gave in the names of several persons who were privy to those transactions, and presented a letter from Munny Begum, which, on examination of the seal, was found to be authentic, mentioning a gift of two lacs (L.20,000) given to the governor by herself. The governor being called upon to refund, refused to acknowledge the authority of the council, and returned no answer. At this critical stage of the proceedings, a prosecution was instituted against Nundcomar, at the instance of the governor-general and his supporters in the council, which, after some ineffectual proceedings, was dropt. But a few days afterwards, Nundcomar, at the suit of a native, was arrested on a charge of forgery; tried before the supreme court by Sir Elijah Impey and a jury of Englishmen, though it was far from clear that the court had any jurisdiction over him, being a native of Hindustan; convicted on doubtful and contradictory evidence; and finally executed, amidst the tears and loud lamentations, and even shrieks of horror, of a vast assemblage of his countrymen. This transaction, viewed in all its bearings, leaves a stain on the character of Hastings, from which it has never been relieved by the zealous testimonials of his friends. In reviewing the whole evidence and circumstances of the case, we cannot well doubt, that if Nundcomar had not accused Mr Hastings, he would never have been arrested; that his real crime, therefore, was the charge which he had brought against Mr Hastings, and not the alleged forgery; and hence that he was tried and executed because he was a witness whose testimony it was more easy to put out of the way than to confute. If this be a just inference, Mr Hastings must be considered as guilty of murder, committed under the forms of law. This is the character which must be fixed upon him by the impartial verdict of history; and his political merits, however magnified by his admirers, cannot be accepted for a moment as any palliation of his moral guilt.

In adverting, as we shall now do, to the transactions of the governor-general with the independent or tributary states of India, it may be observed, that when he assumed the government of Bengal, the Company still laboured under great pecuniary difficulties. Disorder and waste pervaded every department of the administration; the Company's servants were intent, as we have seen, on enriching themselves rather than their masters; and the consequence was a constant want of funds for the public service. The arduous duty of providing these now devolved upon the governor-general; and the necessities of the state, if they do not justify, afford at least a key to some of those dark, and, we must add, atrocious transactions, which distinguished his administration. Bengal had been exposed to such heavy exactions that the country was exhausted; and Mr Hastings, instead of adopting economy, and improving the revenue at home, sought relief in the plunder of foreign princes, who were now laid under contribution to the necessities of the state. The rajah Cheyt Sing, who ruled at Benares, was the son of Bulwunt Sing, who had sided with the English in the war with Sujah Dowlah, subahdar of Oude, and who had been confirmed in his inheritance by the British for a fixed tribute, which was paid with an exactness not very usual in India. Mr Hastings proposed in 1778 to increase this contribution; and because the rajah pleaded poverty, and required time, he became offended, replied to him in harsh and imperious terms, refused to allow time for raising the money, and threatened military execution in case of delay. These exactions were renewed from year to year, and increased, the rajah remonstrating in the most humble terms, and being treated on account of his remonstrances as a delinquent whom it was necessary to punish. "I was resolved," says Mr Hastings, "*to draw from his guilt the means of relieving the Company's distresses.*" This was truly his object, and he accordingly found out guilt in the whole conduct of the rajah, though it was meek and humble, such as the weak naturally assume when they are in the power of the strong. At last Mr Hastings proceeded to Benares, and, notwithstanding the supplications of the rajah, craving forgiveness if he had offended, on the ground of his youth and inexperience, he ordered him under arrest; a tumult arose between the Sepoys and the inhabitants, in which the former were all put to the sword; the rajah fled; war commenced, which ended in his discomfiture, and he was dethroned. His mother, the wife of Bulwunt Sing, the faithful ally of the British, took refuge in the fort of Bidgegur; she surrendered her treasure on condition of being allowed protection for herself and female attendants. But the articles were shamefully violated; and she and her followers were plundered of their effects, and their persons subjected to the rude examination of the licentious soldiery and the followers of the camp. In a letter, Mr Hastings says, "I think that every demand she has made to you, except that of safety and respect for her person, is unreasonable." He afterwards adds, "I apprehend she will contrive to defraud the captors of a considerable part of the booty, by being suffered to retire without examination. But this is your consideration, not mine. I should be sorry that your officers and soldiers lost any part of the reward to which they are so well entitled." The ideas implied in this hint not to suffer these illustrious females to pass without examination cannot be mistaken; it is sufficient to sanction the grossest outrages; and it appears, indeed, that those to whom it was addressed were not slow to profit by the instructions given them.

---

[1] Nine lacs sixty-seven thousand six hundred and ninety-three rupees. A lac of rupees is 100,000, and a crore is 100 lacs, or ten millions. We have adopted the English mode of notation, as more familiar to the reader.

The treasures of Cheyt Sing and his widowed mother fell so far short of the expectations of Mr Hastings, that they did not even pay the expense of quelling the revolt which he had occasioned; and hence this transaction, impolitic as well as unjust, increased the embarrassments of the Company. The governor-general was therefore compelled to look elsewhere for treasures that might be profitable to the state, and he fixed his eye on the two princesses of Oude, known by the name of the Begums, the one the mother of Sujah Dowlah, the late nabob, eighty years of age, and the other his widow, and mother of the reigning nabob, who were possessed of treasures to a great amount, and of jaghires or estates, from which they maintained their own state and dignity, and the numerous families of the preceding nabobs, with a suitable train of attendants. The nabob of Oude, Sujah Dowlah, had long been unable to pay the contributions imposed on him by the English; he was in arrear to the amount of L.1,400,000, and Mr Hastings now entered into a negotiation with him for the seizure, or resumption, to use the official phrase, of the jaghires or estates which belonged to the Begums, for the purpose of enabling him to pay up this arrear. It is unnecessary to dwell on the proceedings by which a son was persuaded or compelled to aid in the spoliation of his mother and grandmother. Suffice it to observe, that Mr Middleton, the agent of Mr Hastings, in order to extort the surrender of the treasure from the princesses, ordered the zenana, the dwelling of the princesses at Fyzabad, with their numerous families, to be blockaded by troops; and these measures failing to obtain the treasures, the eunuchs Jewar Ali Khan and Behar Ali Khan, the confidential servants of the princesses, were imprisoned and put in irons, and were kept from all food, and exposed to secret tortures. These dreadful measures so wrought upon the feelings of the princesses, that the elder Begum surrendered the treasure to the amount of the nabob's bond given to the Company in 1779–1780. But another balance still remained, and new severities were applied to the ministers of the princesses, which drew from them an engagement to complete the demanded sum; but they were still tortured; and though the princesses now delivered their whole effects, even to their table utensils, and had paid upwards of L.500,000 before the 23d of February 1782, and the resident himself reported "that no proof had been obtained of their having more," yet the prisoners were not released, as they earnestly entreated. On the contrary, they were threatened with greater severities to enforce a payment of L.25,000, according to their account, and of L.50,000, according to the resident, still due on the extorted bond; and though they had now lain two months in irons, were sickly, and the officer who guarded them wrote to the resident Middleton, craving that their irons might be taken off, and that they might be allowed to walk in the garden, the nature of his orders allowed no mitigation of their sufferings; they were even threatened a few days after, on the 1st of June, with being removed, and were actually removed to Lucknow, where they were tortured in secret, of which the letter addressed by the assistant resident to the commanding officer of the English guard affords the odious evidence.[1] The cruelties to which the women and children of the zenana, composing the household of the late rajahs, were exposed, are truly shocking to humanity. They were distressed for want of food to that degree that they uttered the most piteous cries, and were even driven to the extremity of appearing publicly before the Sepoys, an exposure dreaded more than death by Hindu females of rank; and these barbarities were executed under the orders of Englishmen, a disgrace to the name, and by English officers, unwilling agents, we may well believe, in such cruelties, and whose letters describe the extreme sufferings of these helpless females. In the letter of the commanding officer, it is said, "they are in a starving condition, having sold all their clothes and necessaries, and now have not wherewithal to support nature." "Last night the women of the zenana assembled on the tops of the buildings, crying in the most lamentable manner for want of food; that for the last four days they had got a very scanty allowance, and that yesterday they had got none. The melancholy cries of famine are more easily imagined than described."[1] These cruelties were continued for nearly a year, and persevered in after all the treasures were surrendered, in the vain hope that some secret hoard might still be retained, which torture would compel them to bring forth. Amongst other particulars, it may be added, that Mr Hastings received from the nabob a present of L.100,000, and craved permission to accept it from the directors, whose orders were positive against the receipt of presents. These princesses were accused of aiding in the rebellion of Cheyt Sing. But of this charge no proof beyond mere rumour was ever adduced; and, in considering all the circumstances of the case, it appears to have been invented as a pretext for despoiling them of their wealth. Mr Hastings resolved to draw from the guilt of Cheyt Sing, to use his own words, the means of relieving the Company's distresses; and the same patriotic motive seems to have dictated the accusation against the Begums. In other countries it is the poor, those who are discontented and in debt, that are turbulent; but here it is the rich, aged women of fourscore and upwards, living in affluence and splendour under the protection of the English, that are accused of rebelling against their benefactors, and of raising disturbances which could bring no advantage, but, on the contrary, were fraught with danger, to them. The directors in Europe disapproved of these proceedings against the princesses; they saw no evidence of their rebellion; and they ordered their estates to be restored, and an asylum to be offered them within the Company's territories. But the authority of the directors was little respected in India, the governor-general never wanting a pretext for disobeying their express commands. It appears, however, that some provision was afterwards made for these princesses, and for the restoration of a portion of their estates. The remaining transactions of Mr Hastings before he quitted Bengal relate to Fyzoolla Khan, who survived the ruin of the Rohilla nation in 1774; and he now entered into a scheme with the nabob of Oude for dispossessing him of his dominions. In a journey which he afterwards undertook to the upper provinces, in order to regulate the affairs of Oude, he was a witness to the desolation of the country from the exactions of his own deputies, a country which was flourishing and happy under the milder sway of Cheyt Sing.

---

[1] We subjoin the two letters. The first, dated January 1782, is addressed by the resident to the officer guarding the eunuchs: "Sir,—When this note is delivered to you, I have to desire that you order the two prisoners to be put in irons, keeping them from all food, &c. agreeable to my instructions of yesterday. (Signed) Nath. Middleton." Letter of the assistant resident to the commanding officer of the English guard: "Sir,—The nabob having determined to inflict corporal punishment upon the prisoners under your guard, this is to desire that his officers, when they shall come, may have free access to the prisoners, and be permitted to do with them as they shall see proper."

On the 8th of February he resigned his office and embarked for England. For a more full detail of the conduct and character of Mr Hastings, the reader is referred to the work of Mr Mill, which contains a clear and well-digested view of all the dark and complicated transactions of his stormy administration. The calm and philosophical tone maintained by Mr Mill; his impartiality and love of truth and justice; and the interest which he uniformly manifests in the cause of suffering humanity, give a peculiar value to his work as a history. In his estimate of Mr Hastings' character, he seems to consider it due to truth to state the difficulties and temptations under which he acted, as to a certain extent palliating his guilt. We may remark, however, that crimes, especially those of a deep dye, are never committed except under strong temptation; and when we consider that those of which Hastings is accused are tyranny, extortion, and corruption in his high office; cruelty, the secret torture by his agents of innocent individuals, by means of famine, stripes, and imprisonment; violence threatened to females by the same agents as the means of extortion, he chiding them all the while for delay; his bargain for the extermination of the Rohillas by fire and sword; and the provinces of Oude and Benares reduced, under his unhappy rule, from contentment and prosperity to desolation; we can scarcely admit the palliations suggested by the candour of the historian. Mr Hastings was impeached, on his return to Europe, before the House of Peers, of high crimes and misdemeanours, of which he was declared innocent by a great majority of his judges. But there were various circumstances which detracted from the value and authority of this acquittal. The House of Lords, from its constitution and character, is unfit to act as a judicial tribunal. It is a political assembly, consisting of the two opposite parties, the one against, and the other in favour of the ruling power; it is thus exposed to the corrupting influence of politics, and is generally ruled, even in its judicial capacity, by the minister of the day, of which, in our more recent history, we have had ample proofs. It wants impartiality, therefore, that essential attribute of a court of justice; and there were, besides, in the present case other sources of delusion. The hope of sharing in the wealth of India had now shed its baneful influence over the land; that hope swayed all the higher classes, including the peers, who lent an unwilling ear to the charges; and this, joined to the reputed favour of King George III. for the accused, rendered the prosecution unpopular. The value of the acquittal was also lessened by the mode of conducting the defence. Mr Hastings was far from courting inquiry; on the contrary, he availed himself of all the legal subtilties of a technical defence. He constantly objected to evidence, and to the production of papers. He acted wisely, if he was guilty, in screening his conduct under legal pleas; but not so if he was innocent, because by resisting inquiry he hindered his innocence from being made clear, to the confusion of his enemies.

The mal-administration of India had now become a standing topic of declamation at home, in which all parties in parliament eagerly joined; and as the privileges of the Company were to expire after the 25th of March 1780, some new arrangement became necessary for the future government of India. Negotiations for this purpose had been begun between the ministers and the directors; and an act was at length passed in 1781, which, besides regulating the dividend, and other financial matters, more fully detailed in the account given at the conclusion of this article, of the commercial transactions of the Company, ordained that the directors should communicate to the ministers all despatches sent to India with respect to revenues, and to civil and military affairs. In 1783 Mr Fox brought forward his celebrated measure for regulating the commercial concerns of the Company at home, and for the better government of their territories abroad. He proposed to supersede the two existing courts of proprietors and directors, by vesting the whole administration of the territories, revenues, and commerce of India, in seven commissioners, to be chosen by parliament; these to have the power of appointing and of dismissing all persons in the service of the Company; nine assistant directors, being proprietors of India stock to the amount of L.2000, to be named by the legislature, and to assist in the details of commerce, and to be under the authority of the superior board. This was the substance of Mr Fox's bill, by which the government of India was transferred from the directors and proprietors to these seven parliamentary commissioners. There were, however, numerous other provisions for securing the punishment of Indian delinquents, for ensuring publicity; and all the serious abuses which had been committed by the servants of the Company were specially enumerated and forbidden. Monopolies were abolished, the land-tax was to be fixed, and it was provided that the zemindars should be reinstated in their dignities and lands.

---

[1] See *Hastings' Trial.* Letters of Captain Leonard Jaques, of 6th and 7th March 1782; also letter of Major Gilpin, dated 30th October 1782. At last the unhappy females became desperate from want, and resolved to break into the market-place; and with this view "they arranged themselves in the following order; the children in the front, behind them the ladies of the seraglio, and behind them again their attendants." They were, however, opposed in their intentions by the Sepoys. On the following day their clamours were more violent than usual. It was resolved to drive them back by force. "The Sepoys," it is added, "consequently assembled, and each one being provided with a bludgeon, they drove them by dint of beating into the zenana." (*Letter to the Resident at Lucknow.*)

In 1784 Mr Pitt introduced a new bill for the better administration of Indian affairs, the chief distinction of which from the other was the institution of a board of control, or of six commissioners, to be chosen, not by parliament, but by the king, who were not to supersede the court of directors, but only to "check, superintend, and control" all the acts and concerns which in anywise relate to the civil or military government or revenues of the Company's dominions; and with this view all letters and orders were to be submitted, before being sent out to India, to the inspection of the board, who might alter and amend these as they should deem expedient; and all communications from India were in like manner to be submitted to its inspection, and this board might even transmit orders to India without being submitted to the directors. The power of the court of proprietors was greatly diminished; a secret committee of directors was appointed; a provision was made for enforcing the disclosure by individuals of the fortunes brought home by them from India; and a new tribunal was erected for the trial of offences committed in that country. The nomination of the commander-in-chief was vested exclusively in the king; that of governor-general, presidents, and members of all the councils, in the directors, subject to the approbation of the king; which clause, rendering the approbation of the king necessary, was afterwards modified, but he was still allowed the power of recall. The servants in India were forbidden to engage in war, to receive presents, or to disobey orders transmitted by the board; and provision was made for the restoration to the zemindars of the lands from which they had been ejected. In the year 1786 no less than three acts were passed for the amendment of this act, by one of which power was given to the governor-general to act without and even against the consent of this council; by another the military was subjected to the civil power; and by a third act, the most efficient clause of Mr Pitt's bill was repealed, which ordained every public functionary of the Company, on his return to Europe, to make a full disclosure on oath of the property he possessed. This was considered as too severe a test for the Company's servants, though it could not have affected those who acted honestly. It is the guilty only who suffer by inquiries of this nature.

Mr Pitt's bill defined rather loosely the respective powers of the board of control and the directors; and the consequence was, that they speedily came into collision. The first question which came under their joint consideration, was the settlement of the nabob of Arcot's debts. These debts were owing to the Company's servants, and it was not very clear that any equivalent had been given for them. Paul Benfield, a principal creditor, who, as we have already mentioned, acted as a junior clerk of the Company, with a salary of some hundreds a year, advanced a claim, which, with interest, amounted to L.592,000. Such transactions, therefore, were of so very doubtful a character, that they presented a *prima facie* case for inquiry; and Mr Pitt's bill accordingly provided that the court of directors "should take into consideration the origin and justice of such demands." But how great was their surprise when the board of control ordered that these debts, some of them contracted in 1767, should be all paid without inquiry, and with the addition of interest at the rate of twelve per cent. The directors remonstrated against this proceeding, but in vain. The board ordered the debts to be paid immediately, though, in a similar case in 1805, the commissioners appointed to inquire into the more modern debts of the nabob of Arcot, out of claims to the amount of L.20,390,570, allowed only L.1,346,796. These facts too clearly point to the parliamentary influence of the East India interest as the true spring of this corrupt transaction; and the same interest also prevailed in subverting the plan which Lord Macartney had adopted for the management of the Carnatic revenues, and in restoring the administration of the nabob, which was a system of misrule that impoverished the country exactly as it tended to enrich the Company's servants. This, and other differences which arose, induced the directors to question the powers of the board of control; and a declaratory act was in consequence brought forward by Mr Pitt explaining these powers, according to the interpretation, not of the directors, but of the ministers. This act vests the real power in the board of control, though in practice a large share both of power and patronage has been still left to the directors.

War with Tippoo.

Lord Cornwallis assumed the government of India in September 1786. He had ample instructions both from the court of directors and the board of control; and he carried into effect several very important reforms, both in the management of the revenue and in the administration of justice, whilst in his arduous contests with Tippoo he fully maintained the honour of the British arms. To the native and dependent powers his conduct was moderate and just; and one of his first cares was to relieve the nabob of Oude from the extortions of the former government, by which the country was impoverished, and in many places deserted and desolate. The wretched condition of the people is described in strong terms by Lord Cornwallis; and he now reduced the annual payment of the nabob from eighty-four lacs, equal to L.940,000, to fifty lacs, and left in his hands the internal government of his country. But the mind of the governor-general was soon engrossed by other and more momentous concerns. Tippoo, who naturally viewed with jealousy the growing ascendency of the British, began to take hostile measures. He descended from the Ghauts with a large military force, and spread alarm along the whole western coast. At length, throwing off all disguise, he commenced an attack on the rajah of Travancore, an ally of the British, and invaded his dominions. Lord Cornwallis now prepared for war. He formed a league with the Mahrattas and the nizam, who agreed to aid with a military force in the approaching contest. The plan of the campaign was, that a division of the British under General Meadows should penetrate through the province of Coimbetore into the heart of the Mysore country, whilst General Abercromby should reduce the territory of Tippoo on the coast of Malabar, and Colonel Kelly remain to protect the Carnatic from the ravages of the enemy. The division of General Meadows marched from the plain of Trichinopoly on the 15th of June 1790, and all the fortresses in the line of its march, namely, Caroor, Daraporam, Erroad, Coimbetore, Sattimungul, Dindigul, and Palacatcherry, were necessarily occupied, by which the army was divided into three bodies, one at Coimbetore, another at Sattimungul, sixty miles distant, and a third at Palacatcherry, about thirty miles in the rear. In this situation, Colonel Floyd at Sattimungul, was attacked and forced to retreat with loss, and with great difficulty effected a junction with General Meadows. The sultan now resolved to attack, and, if possible, surprise the English chain of posts. He retook Erroad; approached Coimbetore, which had been previously reinforced; and afterwards turned to Daraporam, which capitulated. Colonel Maxwell with his corps being ordered to invade Barramahal, the sultan, leaving part of his army to watch General Meadows, hastened to attack, and, if possible, to cut off this detachment. The British, and a regiment of cavalry, inveigled in a defile, were driven back with great loss. But the able dispositions of Colonel Maxwell frustrated any further attempts on the part of Tippoo; and he soon afterwards effected his junction with General Meadows. The sultan having thus succeeded in defeating the original plan for the invasion of Mysore by a rapid march into the Carnatic, arrived before the English depôt of Trichinopoly, whither he was followed by General Meadows, and afterwards to Trincomalee; and thus ended this indecisive campaign. The Malabar country was in the course of three weeks completely reduced under the British power by the force under General Abercromby.

Lord Cornwallis now resolved to assume the command of the army, and, advancing to the Ghaut Mountains in the direction of Velore, to lay siege to Bangalore, and thence to proceed against Seringapatam, the capital of Mysore. Early in February 1791 he was on his march to Velore; and on the 5th of March the English army sat down before Bangalore, which on the 21st was carried by assault; an event which, fixing the seat of war in the enemy's territory, proved decisive of its success. On the 28th Lord Cornwallis began his march from Bangalore, in the course of which he was joined by the nizam's force, amounting to 10,000 cavalry, which were found to be of little service. On the 13th of May the British army reached Anika, about nine miles from Seringapatam, destitute both of provisions and of draught cattle. It was the intention of Lord Cornwallis that General Abercromby, ascending through the passes of the Ghauts from Malabar with the Bombay army, and the Mahratta force under Purseram Bhow, should penetrate into the centre of the sultan's dominions, and co-operate with the main army in the attack of the capital. Of the movements of this force Lord Cornwallis had received no intelligence; and having defeated Tippoo's army in the vicinity of Seringapatam, he now resolved, as the Cavery was too large to be crossed in safety, to ascend to a ford at Cansambaddy, eight miles above Seringapatam. In this march the troops were exposed to unexampled hardships; to disease, from scarcity of food, and of the means of conveyance owing to the complete failure of the draught cattle; and all their calamities were aggravated by the small-pox, which raged in the camp. It was now apparent that the army could only be saved by a timely retreat, and by the sacrifice of the battering train and all the heavy equipments. On the 21st of May, accordingly, the retreat was begun; and immediate orders were sent to General Abercromby to follow the same course, which occasioned a similar destruction of the battering train and other heavy equipments. So great was the destruction, that the ground on which the army of Lord Cornwallis had encamped at Cansambaddy was covered to an extent of several miles with the carcasses of the cattle and horses; and the last sight of the gun-carriages, carts, and stores of the battering train, left in flames, was the melancholy spectacle which the troops beheld, as they passed along, on quitting this deadly camp.

Fortunately for the British army, it was met, before the end of the first day's march, by the allied force of the Mahrattas, under Purseram Bhow and Hurry Punt. Every despatch sent to these chiefs had been intercepted by the vigilance of the enemy, and they were astonished when they learned the disasters which had been occasioned by their delay. Their arrival, which evinced their sincerity in the cause, produced general satisfaction in the British camp, and a conviction, that the ruin of the sultan, though delayed, was now certain and inevitable. Tippoo, overawed by this formidable confederacy, made overtures to Lord Cornwallis for the conclusion of a peace; but that nobleman would listen to no terms of accommodation in which his allies were not included, and which were not preceded by the release of all the prisoners that had been detained during the present and former wars. The arrival of the Mahratta troops, amounting to 32,000 cavalry, however fortunate it might be deemed at the critical moment in which it happened, brought little additional effective strength to the allied army. Their battalions were unwieldy, irregular, and ill disciplined; their force had declined as much as Tippoo's had advanced in improvement; and they were at present far inferior to those troops who, under Madha Row, had defeated Hyder Ali in 1772.

Treaty with Tippoo.

The combined armies amounted to about 80,000 men; and if to these be added four times the number of camp followers, brinjarries or grain carriers, and the carriage department, the number of strangers to be subsisted in the Mysore alone could not be much less than half a million. That no distrust, jealousy, or counteraction, should have disturbed the combined operations of such an immense multitude, must be ascribed to the unexampled moderation and the vigilant conduct of the commander-in-chief. Such a vast army had never taken the field in India in the British cause; yet no murmurs, nor even the slightest appearance of distrust, were ever manifested by the allies towards the British commander. They submitted with implicit confidence, not only to his arrangements in carrying on the war, but, which was little to be expected among allies so much alive to their particular interests, they acquiesced in his distribution of the conquered territories, with a deference which evinced the most perfect confidence in his liberality and justice. With these coadjutors, Lord Cornwallis set out in the month of June towards Bangalore. He determined on a new and circuitous route northward by Naggemungulum; and in order to facilitate the communication between the Mysore and the Carnatic, from which the supplies were chiefly to be drawn, the various hill forts which command the different passes were to be reduced. Amongst these forts, remarkable for natural strength, Oossoor, Rayacottahud, and Nundydroog, were assaulted and taken. There remained Kistnaghery, Savendroog, and Ootradroog, on the first of which an unsuccessful attack was made. Savendroog consists of a vast mountainous rock, which rises above half a mile in perpendicular height above its own base, which covers a space of eight or ten miles in circumference. This rock is surrounded by walls on every side, and defended by cross barriers wherever it was deemed accessible. Towards the upper part, the immense pile is almost precipitous, and has the further advantage of being divided on the top into two hills, which have each their defences, and are capable of being maintained independently of the garrison in the lower works. To the siege of this tremendous fortress, Lieutenant-Colonel Stewart, commanding the right wing of the main army, was appointed. The attempt commenced on the 10th of December. In three days a practicable breach was effected, and both hills were stormed, with only one private soldier wounded. Colonel Stewart's detachment marched in two days against Ootradroog, another fortress strengthened by five different walls, and so steep as to prove tenable by a handful of men against the largest army. After the refusal of a summons to surrender, the lower fort was escaladed with such rapidity, that the killadar requested a parley. But on some appearance of treachery in the upper fort, the assault was ordered; some of the gates were instantly broken, others were escaladed, till five or six different walls on the face of the steep rock were passed, when the troops gained the summit, and put the garrison to the sword. The assault of these fortresses, which had hitherto been deemed impregnable, made so serious an impression on the enemy, that in none of the hill forts, however inaccessible, did they afterwards make any attempt to resist the British troops. Hence the strong mountainous country between Bangalore and Seringapatam, which, studded with forts, had so much checked all communication, now afforded security to the convoys. These henceforth reached the army without opposition; and the supplies of warlike stores of every description were as completely re-established as they had been at the beginning of the last campaign.

To prevent any future scarcity of the great article of grain, the commander-in-chief encouraged the native brinjarries, a class of men of whom we have already given some account. They form a peculiar caste, who are traders in grain, and whose utility is so universally acknowledged that they are regarded as neutral in war, and are not hindered by either of the belligerents from carrying supplies of grain to the other. By constantly affording regular payment and a good price to these native merchants, they supplied the camp to an extent far exceeding what could ever be furnished by the most extensive carriage establishment. With such ample supplies, preparations were made for the commencement of the campaign. The Bombay troops, destined again to act from the same quarter as last season, marched from Cananore, and arrived at the foot of Poodicherrim Ghaut in the month of December. Several weeks of hard labour were necessary to drag the artillery through woods extending nearly sixty miles, and over mountains of immense height, when this force, consisting of 8400, with all their baggage and artillery, and a supply of rice for forty days, penetrated with safety into the Mysore frontier, which they reached on the 22d of January 1792. To facilitate the return of the army, batteries were constructed to defend the pass; a precaution which, if the sultan had not overlooked, he would have suffered no invasion on this quarter of his dominions.

The Mahratta forces, after taking the important post of Simoga, which, however, was soon retaken by one of Tippoo's generals, and defeating Reza Saib and nearly 10,000 of the sultan's cavalry, effected their junction with the Bombay army, though somewhat later than the appointed season. The main army under Lord Cornwallis, being joined at Ootradroog by the battering train under Colonel Duff, and the last convoys under Colonel Floyd, and also by the army of the nizam, was at last fully prepared to resume its enterprises against the sultan, who, in imitation of his father when formerly attacked in 1767, had encamped with the whole of his force in a strong position under the walls of his capital. On the 1st of February the allied armies marched from Hooleadroog, the last hill fort of which they had taken possession, lying at the distance of only forty miles from Seringapatam. The last march, of the 5th of February, stretched across a range of barren hills lying six miles north-east of Seringapatam. From these heights a view of the whole city was presented to the army, and the encampment of the sultan under its walls. Every circumstance was eagerly viewed by our troops; and, from the sultan's position, it was evident that he meant to defend the place in person, and to make it the grand concluding scene of the war. The camp of the allies was pitched on the north side of the island. The British formed the front line, and extended along both sides of the Lockany, a small river which at this place flows into the Cavery. The reserve was placed a mile in the rear, to afford space for the baggage and stores; and the nizam and Mahrattas were stationed still farther in the rear, to prevent interference with the British camp.

Opposite to Seringapatam, on both sides of the river, a large space was enclosed by a bound hedge, which marks the limits of the capital, and afforded a refuge to the peasants during the incursions of cavalry. Tippoo's front line, or fortified camp, lay immediately behind this hedge, where it was defended by heavy cannon in the redoubts, and by a large field train advantageously placed. In this line there were a hundred pieces of artillery, and in the fort and island which formed his second line there were above thrice that number. The redoubts on his left were intrusted to two of his best officers, and a corps of Europeans commanded by Monsieur Vigie; Sheik Ansar, a general of established reputation, was stationed on the right, and the Carighaut Hill; whilst Tippoo himself commanded the centre, having his tent pitched in the sultan's redoubt. The fort and island, where there was the greatest number of guns, were intrusted to Syed Saib and other commanders. The whole army of the sultan thus stationed consisted of about 50,000 men.

The whole attention of Tippoo, on finding that he could not keep the field, was directed to the fortifying of this camp, and the strengthening of his defences in the fort and island, under the idea that the want of supplies, or the approach of the monsoon, would again force his enemies to abandon their enterprise, as they had been compelled to do on former occasions. In these circumstances, Lord Cornwallis resolved on the bold enterprise of a night attack on the enemy's fortified camp. Accordingly, on the evening of the 6th of February 1792, just after the troops had left the parade, orders were issued for an attack at seven o'clock, of the enemy's camp and lines, in three divisions. The British camp was left to be defended by the artillery and cavalry; whilst the assailants, who were instantly furnished with guides and scaling ladders, marched in perfect confidence that muskets alone, for they were unprovided with artillery, would prove the fittest instruments for opening their way into the enemy's camp. The allies of the British, to whom this design was not communicated till after the columns had marched, were struck with surprise and consternation on learning that Lord Cornwallis, like a common soldier, was personally to lead the attack on the enemy's fortified camp. They not only deemed his success impossible, but they dreaded that the ruin of the allied army would be involved in the attempt.

The three columns into which the assailants had been divided marched with equal intrepidity to execute the different objects which had been allotted them. Many obstacles intervened; various conflicts ensued in different quarters of the enemy's camp; each party was uncertain of the fate of the rest, and each individual of his associates. The return of day at last removed their fears and uncertainty, by disclosing the complete success which had crowned their exertions throughout the whole line of attack. The enemy having lost all their positions on the north side of the river, where the siege was to commence, and almost the whole of the island, every material object of the assault was secured. On the side of the British, the loss, though considerable, amounting to 536 men, was small in proportion to the importance of the victory and the disasters of the enemy, of whom it afterwards appeared that 4000 had been slain in the various conflicts during this night of enterprise, danger, and death, besides a much greater loss which was suffered by desertion.

The British army, now in possession of the island and town of Seringapatam, and flushed with the pride of victory, immediately began to make the necessary preparations for the siege of the fortress or citadel. The mosques and religious buildings on this enchanting island, watered by the Cavery, and the seat of perpetual verdure, were converted into hospitals for the wounded and sick; and the trees, now for the first time assailed by the axe, furnished materials for fascines and gabions for the approaching siege. The sultan was now seriously alarmed; and after vain efforts to retard the siege by a distant cannonade, which occasioned little injury, he at last began to meditate seriously on the necessity of a peace. In order to smooth the way for his overtures, he previously liberated two British officers, who had been detained contrary to capitulation in Coimbetore. These officers, who had not been treated with his usual rigour, he loaded with presents, and made the bearers of a letter to Lord Cornwallis, suing for peace. He at the same time had recourse to another daring expedient, which might have been attended with fatal consequences. He despatched a small party of horsemen in the night to surprise the tent of Lord Cornwallis, and to put him to death. The party were detected by their eager inquiries after the commander's tent; and being fired upon, effected their retreat. The Bombay army, which was at this time approaching, effected its junction with the main army on the 16th; and on the second night after this event the trenches were opened, and a parallel formed within eight hundred yards of the north face of the fort. General Abercromby, stationed on the southern quarter with a strong detachment, was ordered to cannonade it from the heights. This attack being directed against the weakest part of the fort, occasioned the greatest alarm. Tippoo himself, therefore, at the head of his troops, marched to dislodge the general. Being supported by the guns of the fort, he maintained the action for the whole day; but towards evening he was forced to retreat. This desperate effort was the last that Tippoo made for his defence. His affairs hastened to a crisis; cabals were formed by the chiefs, and his troops deserted in multitudes during the night. He saw his capital blockaded on every side by a powerful army, plentifully supplied with provisions, which must infallibly reduce his troops by famine, should they even prove successful in repelling its assaults; even his last hopes of relief from the monsoon, and the swelling of the river, were thus finally cut off.

On the 23d of February, therefore, the preliminaries of peace were signed by Tippoo, amidst the conflicting emotions of pride, resentment, and fear; and orders were issued to the troops on both sides to cease from further hostilities; a stipulation of which the dread of an immediate assault alone enforced the observance.

By the terms of this treaty, Tippoo was compelled to pay, as an indemnification for the expenses of the war, three crores and thirty lacs of rupees, at two instalments, the first to be advanced immediately, and the second at the end of four months. Other articles of this instrument provided further, that all the prisoners taken from the allied powers, from the time of Hyder Ali, should be unconditionally restored; that no less than one half of his territories should be ceded to the allies, and that two of Tippoo Sultan's three eldest sons should be given as hostages for the due performance of the treaty.

About noonday on the 26th, the young princes, the one eight, and the other ten years of age, mounted on their elephants richly caparisoned, and attended with a splendid retinue, left the fort, the walls and ramparts of which were crowded with spectators. Amidst the vast multitudes whom curiosity or affection had drawn out to witness this scene, Tippoo himself was beheld standing above a high gateway, through which, as they passed, the princes were saluted by the guns of the fort; a compliment which they again received as they approached the British camp. They were seated in silver howdahs, attended by their father's minister and a numerous retinue. The procession which they thus formed was equally grand and interesting. It was led by several camel harcarras and standard-bearers, carrying green flags suspended from rockets, followed by one hundred pikemen, with spears inlaid with silver Their guard of two hundred Sepoys, and a party of horse, brought up the rear.[1]

Lord Cornwallis, attended by his staff, and the principal officers of his army, and a battalion of Sepoys, received them at the door of his tent, and embraced them with a cordiality and tenderness that resembled parental affection. The manners, dress, and appearance of the young princes themselves, formed an interesting spectacle to their European hosts. They were clothed in red turbans and long white muslin gowns, everywhere sparkling with emeralds, rubies, and pearls. Thus attired, the young princes, immediately after their reception, were seated on each side of Lord Cornwallis, when Gulam Ali, the head vakeel of Tippoo, thus addressed the British general:— "These children were this morning the sons of the sultan my master; their situation is now changed; they must look up to your lordship as their father." The scene now became most interesting; the faces of the children brightened up; and not only their attendants, but all the spectators, were delighted to observe, that any fears they might have harboured were removed, and that they would soon be reconciled to their change of situation. After being regaled, in the eastern manner, with ottar of roses and betel-nut, the princes were presented each with a gold watch from Lord Cornwallis, a gift from which they seemed to receive great delight. Lord Cornwallis next day visited them in their tents; and each of them made him a present of a Persian sword, and he made them a present of some elegant fire-arms in return.

Some difficulty occurred in adjusting the terms of a definitive treaty. When the territory of the Coorga rajah, in particular, was required, the demand seemed unexpected both by the sultan and his ministers, and was at first received with astonishment and disdain. This rajah was considered as a chief cause of the war, and Tippoo, therefore, wished to crush him. Lord Cornwallis seemed equally resolute in his defence; for he again manned the works, and threatened to recommence the attack. Happily, his stock of provisions was ample; and although upwards of 400,000 strangers and half a million of cattle were daily to be fed, the supply was sufficient for the whole; whilst one million sterling of the fine imposed on Tippoo had already been paid. The firm determination of the commander-in-chief, aided by these circumstances, which were not unknown to the sultan, damped his resolution. His resentment cooled, and he finally acceded to the terms agreed upon, and copies of the treaty were delivered to the confederated powers.

Nabob of Oude.

From the conclusion of this treaty, dictated to Tippoo by an English army at the gates of his capital, no great event occurs in the history of India till the renewal of the war in 1798, during the administration of Lord Mornington. The affairs of the nabob of Oude, and his dominions, were both hastening to ruin under his own mismanagement and that of the English; and, with a full knowledge of this, his sway was now extended over the district of Rampore in the Rohilla country, granted to Fyzoolah Khan, the Rohilla chief, who survived the ruin of his nation, and who died at an advanced age in 1794, leaving the territory of which he was ruler in a high state of cultivation. On the pretence of the usurpation of the reigning prince, who had made his way to the throne by the murder of his brother, the British troops made war on the Rohillas, and defeated them. The treasures of the late chief, amounting to 332,000 gold mohurs (L.607,000), were given to the vizir or ruler of Oude, who returned twelve lacs of rupees (L.127,000) to the British army; ten lacs of revenue were assigned for the support of the lawful prince, now dethroned; and the unhappy country was handed over to be pillaged and destroyed by the vizir and his English allies. He soon afterwards died, and was succeeded by Mirza Ali or Vizir Ali, who was set aside by the English on the reputed spuriousness of his birth, and Saadut Ali, the eldest surviving son of Sujah Dowlah, was placed on the throne. The annual subsidy to the English was at the same time raised to seventy-six lacs of rupees.

---

[1] For the substance of this account, see Major-general Dirom's narrative of this campaign.

Transactions at Madras.

The Nabob Mahommed Ali, the first ally of the English, died in 1795, at the age of seventy-eight, and was succeeded by Omdut-ul-Omrah, his eldest son. Lord Hobart, governor of Madras, now determined to interfere with a strong hand in the affairs of the Carnatic, and, if possible, to rescue the country from the merciless exactions to which it had been exposed. These evils he describes to arise from the numerous loans of the English to the nabob. "Some of the principal houses of business in Madras," he observes, "or even some of the Company's servants, enter into an agreement with the nabob for the payment of sums which may have become due to the Company's treasury. They receive a mortgage upon a portion of the territory. To render this availing, they stipulate for the appointment of the manager of the territory. It is also requisite to establish an understanding with the military commanding officer of the district. And then the chain of power is complete. Then the unhappy ryots (husbandmen) are delivered over to the uncontrolled operations of men who have an interest in nothing but exacting the greatest sums in the shortest time; of men hardened by practice, and with consciences lulled to rest by the delusive opiate of interest upon interest." Lord Hobart prepared to remove these evils by assuming the management of the nabob's revenues, and, in short, the internal government of the country. But these arrangements being opposed by the supreme government, were not at this time carried into effect.

Invasion of the nizam's territories by Scindia.

The British had now acquired an undisputed ascendency in India. The other ruling powers were the Mahrattas, under the peshwa and Scindia; the nizam of the Deccan, an ally and dependent of the British; and Tippoo, so greatly humbled and weakened by the late war as to be no longer formidable. Each of these powers was jealous of the others, though the balance of power was chiefly endangered by the ascendency of the British. The nizam, after the conclusion of the war with Tippoo, was extremely desirous of forming an alliance with the English as a defence against the encroachments of the Mahrattas, who, he was well informed, were planning an inroad into his dominions, for the purpose of levying the contribution of the chout, amounting to one fourth of the land revenues, to which they laid claim, on condition of guaranteeing the remainder. The English, though bound to the nizam by a treaty offensive and defensive, refused to join in any alliance against the Mahrattas, who, under the command of Dowlut Row Scindia, Mahadjee Scindia being lately dead, now invaded the nizam's territories, and having defeated his army and shut him in one of his fortresses, dictated a treaty of peace to him, by which he ceded a country yielding thirty-five lacs of revenue, paid them a large sum, and gave up his minister as an hostage for the performance of these conditions. Tippoo, since the conclusion of the peace negotiated by Lord Cornwallis, had laboured assiduously to regain his lost power and influence, and had employed all the means which suggested themselves for inducing the French to lend their assistance in expelling the English from India.

Lord Mornington arrived in Calcutta as governor-general in May 1798, and he had scarcely been a month in India when printed copies of a proclamation announcing the hostile designs of Tippoo, and inviting French subjects to join his standard, were circulated at Calcutta. The inquiries instituted by the governor-general not only substantiated the authenticity of this document, but developed a variety of facts illustrative of the irreconcileable enmity of Tippoo against the British. No course now remained but to establish a permanent restraint upon Tippoo's future means of offence; and Lord Mornington at once resolved upon a series of extended operations against Mysore. Tippoo, as the event too fatally for himself proved, was unprepared for war. Stripped of half his dominions and revenues by the last treaty, he had not the means of maintaining war; whilst the power of his rivals was formidably increased, and their numerous and well-appointed armies, and extended dominions, justly excited the dread and the jealousy of the native powers, and probably of Tippoo amongst others. But the humbled king of Mysore was no longer himself an object of jealousy and dread: the last treaty was dictated by a victorious army at the gates of his capital; its terms, from his unprovoked aggression of the British allies, were necessarily severe; and circumstances had since occurred which fully justified the British in exacting additional securities from the fallen prince. It was known that he had been in communication with Zemaun Shah, the ruler of Caubul, and that his intercourse with that prince had for its object the invasion of the N. of India in order to facilitate the projected hostile measures on the part of Tippoo in the S. It was ascertained that an embassy consisting of two natives, accompanied by a French officer, had been despatched by him to the executive directory of France. At Poona and at Hyderabad his efforts had been directed to counteract British influence, and to engage both Mahratta and Mohammedan chiefs in his views. The objects of the governor-general, as explained by himself, were, by obtaining the whole maritime territory remaining in the possession of Tippoo on the coast of Malabar, to preclude him from all future communication by sea with his French allies—to compel him to defray the entire expenses of the war, thus securing reimbursement of the outlay rendered necessary by his hostility, and, by crippling his resources, increasing the probability of future security—to prevail on him to admit permanent residents at his court from the English and their allies; and to procure the expulsion of all the natives of France in his service, together with an engagement for the perpetual exclusion of all Frenchmen both from his army and dominions. Before hostilities commenced, however, the sultan was allowed time to avert them by timely concession. Intelligence of Lord Nelson's recent victory over the French fleet was communicated to him with suitable remarks; and a letter addressed to him by the governor-general adverted to the transactions between that prince and the French government of the Mauritius, and contained a proposal to send an English officer to Tippoo, for the purpose of communicating the views of the Company and their allies. Tippoo's answer contained a ridiculous attempt to explain away the embassy to the Mauritius and its consequences, and his communication in other respects was so extremely vague, that the governor-general determined to suspend all negotiation with the sultan until the united force of the arms of the Company and of their allies should have made such an impression on his territories as might give full effect to the just representations of the allied powers. Three armies were now assembled for the invasion of Mysore—namely, the army of General Harris at Velore, which was to advance from the east; the army of General Stuart at Cananore, on the western coast; and a force under Colonels Read and Brown in the southern districts of the Carnatic. On the 9th of March the army made its first united movement, and in the course of its advance experienced no serious resistance. The greatest obstacle to its progress arose from the want of provisions, and an adequate supply of carriages. All these difficulties were, however, overcome: and on the 5th of April the united army took up its position for the siege of the capital, exactly one month after it had crossed the frontier. Tippoo made a last and vain appeal to his enemies. But the governor-general was now resolved on the conquest of the country. His views expanded with the success of his arms; and towards the end of April he declared his opinion, that "it would be prudent and justifiable entirely to overthrow the power of Tippoo;" and "that the power and resources of Tippoo Sultan should be reduced to the lowest possible state, and even utterly destroyed, if the events of the war should furnish the opportunity." On the 3d of May a practicable breach was made, and next day the assault took place, which, notwithstanding an obstinate defence, was successful at every point. The assailants, carrying everything before them by the impetuosity of their attack, met over the eastern gateway; and the palace, in which were the family of the sultan and a body of his most faithful adherents, was the only place within the fort that still held out. From motives of humanity, the English were extremely averse to expose its inmates to the horror of an assault, and they at length succeeded in effecting its peaceable surrender. Major Allan, who was admitted to the apartments of the young princes, endeavoured, by every expression of tenderness, to soothe the agitation of their minds. They were conducted to the presence of General Baird, who assured them, in the kindest manner, of protection from violence and insult, and gave them in charge to two officers, to be conducted to the head-quarters of the general. The sultan lost his life in the defence of his capital, and his body was found amidst heaps of slain. He had been repeatedly wounded in the course of the conflict; and his attendants having placed him in his palanquin, he was observed by the English soldiers who first entered. One of them in attempting to pull off his sword-belt, which was very rich, received a wound from the sultan, who still held his sabre in his hand; on which, putting his musket to his shoulder, he fired, and the sultan, receiving the ball in his temple, expired.

Defeat and death of Tippoo.

The kingdom of Mysore, which was now in possession of the English, was partitioned amongst the allied powers. The English and the nizam received equal portions of the conquered territory, and a smaller portion was reserved for the Mahrattas. The possessions of the sultan on the Malabar coast, the district of Coimbetore and Daramporam, the whole country which lay between the Company's territory on the eastern and western coasts, the passes of the Ghauts, the district of Weynaad, and the city and island of Seringapatam, were surrendered to the British, who now occupied the country from sea to sea. A territory of equal revenue was ceded to Nizam Ali, in the districts of Gooty, Gurrumcondah, and the tract of country which lies along the line of the great forts of Chittledroog, Sera, Nundydroog, and Colar, with the exception of the forts. The territory ceded to the Mahrattas, from one-half to two-thirds of the other portions, was to include Harpoonelly, Soonda above the Ghauts, Annagoody, and some other districts; also the territory, though not the fortresses, of Chittledroog and Bednore. The remaining portion of the sultan's territories was erected into a separate state, over which was placed a descendant of the ancient rajahs, who had been retained in confinement by Tippoo and his father; with such conditions, however, as provided for the transfer of the entire administration to the British in the event of misgovernment. The treasures of Tippoo, amounting to sixteen lacs of pagodas (L.640,000), and his jewels, valued at L.360,000, were divided amongst the troops. The fortress of Velore was commodiously fitted up for the future residence of the royal family, to whom, and to all Tippoo's confidential servants, such pensions were assigned, that they were no less surprised than gratified by the liberality of the conquerors.

The influence of British authority is not confined to the dominions immediately subjected to it; it is exerted over nearly the whole of India, by virtue of protective treaties with the native princes. In the states thus situated the prince exercises the functions of sovereignty, under the control of the British power, which is represented by a resident agent. The presumed advantages of this arrangement are mutual. The prince and his successors are guaranteed in the possession of their dominions; and in return, the ruling prince renounces all external connections, except with the British, through whom alone negotiations are conducted, and by whose decision he is bound in all matters of dispute with other states. In some cases the prince consents to receive a subsidiary force; in others this provision is dispensed with. But the great principles which pervade them all are the supremacy of the British, and the dependency of the native government. In 1798 a treaty was concluded with the nizam, by which he agreed to dismiss a force under French officers, which he had hitherto maintained, and to receive and to pay a British force in its stead, whose aid, it is certain, was absolutely necessary for the defence of his dominions. This was therefore the commencement of British ascendancy in that country. In Oude the military power had long been vested in the Company. Upon the death of Shujah-ud-Dowlah in 1775, and the succession to the throne of his eldest son, it was stipulated that a brigade of British troops, consisting of two battalions of Europeans, one company of artillery, and six battalions of sepoys, should be stationed in Oude whenever required by the vizier, for the support of which he engaged to pay an annual sum of about L.300,000. Additions were made to this force in 1781, and again in 1787, when the Nawaub vizier agreed to fix his subsidy at L.500,000, in which sum were included the expenses of the British Residency. In 1797 the vizier consented to defray the expense of two regiments of cavalry, one European and one native, making the total subsidy L.555,000 per annum. Shortly afterwards the Company bound themselves to defend the territories of Oude against all enemies. In order to enable them to fulfil this engagement, and at the same time to provide for the protection of their own dominions, they had largely increased their military establishment by the addition of new levied regiments, both of infantry and cavalry; and in consequence thereof Saadut Ali agreed, in 1798, to increase the subsidy to L.760,000 per annum. The Nawaub vizier also ceded the fortress of Allahabad, and gave L.80,000 to the Company for its repairs, and L.30,000 for those of Futtehghur. The British troops in Oude were not to consist of less than 10,000 men, including Europeans and natives, cavalry, infantry, and artillery; and should it become necessary to augment the Company's troops beyond the number of 13,000 men, the vizier agreed to pay the actual difference occasioned by the excess above that number. The threatened invasion of Zemaun Shah attracted the attention of the Marquis Wellesley (then Earl of Mornington) to the state of Oude. It was desirable to substitute efficient troops for the unskilful and undisciplined force maintained by the vizier, and to place the defence of the Oude frontier against foreign invasion upon a more substantial basis. To accomplish these objects the pecuniary subsidy was commuted for a territorial cession; and by treaty, 10th November 1801, the Nawaub vizier ceded the Southern Doab and the districts of Allahabad, Azimgurh, Western Goruckpore, and some others. estimated to yield in the aggregate an annual revenue of L.1,352,347. About the same time the nabob of Surat, the nabob of Arcot, against whom a lucky discovery was made of a criminal correspondence with Tippoo, and the rajah of Tanjore, were all dethroned, and pensions assigned them for their support. The benefits anticipated from these measures have been fully realised. Most of the protected states have been wretchedly misgoverned; and there cannot be the slightest doubt that the people have been far happier as British subjects. Yet some suspicion must attach to the motives of those who, after the death of Fyzoolah Khan, could transfer the flourishing country of the Rohillas from the mild sway of its lawful rulers to the misrule and oppression of the nabob of Oude. A bad was here substituted for a good government. If good government had been the sole object, how greatly would it have been promoted by the transfer of the territory from native to British rule. The British provinces have been steadily advancing in prosperity; the progress of the protected states has been from bad to worse.

The Mahratta powers.

The Mahratta powers, namely, the peshwa, the nominal head of the confederacy, whose capital was Poonah, the rajah of Berar, Holkar, and Scindia, now remained the only rivals of the English for the dominion of India; and it was the policy of the Marquis Wellesley, as he himself explains at large in his correspondence with the residents in India and the directors at home, to form subsidiary alliances with them, on the same terms as with the other states of India; namely, that a British force should be permanently stationed within their dominions, and that they should assign a sufficient quantity of land for its maintenance and pay. The effect of this alliance, as indeed its object, as stated by the marquis, was to secure the dependence of the different states of India on the British power. "The measure of subsidizing a British force, even under the limitations which the Peshwa has annexed to that proposal (namely, its being stationed without the limits of his dominions), must immediately place him in some degree in a state of dependence on the British power." This effect was very plainly seen by the Mahratta princes, as well as by the governor-general; and accordingly, though the arrangement was very zealously pressed upon the peshwa, as well as on Scindia, it was steadily rejected by both, until the former was reduced by necessity to accept the alliance of the British on their own terms. This necessity was brought about by contentions amongst the Mahratta chiefs, Holkar and Scindia, for political ascendency in the court of Poonah. Mahadjee Scindia, who was the founder of the family, was the son of Ramojee Scindia, whose humble employment at the court of Poonah was to carry the peshwa's slippers, but who afterwards rose to eminent rank, and was known as an enterprising soldier. Mahadjee was also a soldier, and was present in the fatal battle of Paniput, from which he narrowly escaped with a severe wound in his knee by a battle-axe. He afterwards acquired land and troops, and rose, as the power of the peshwa declined, to the rank of an independent chief. He died at Poonah in 1794, leaving to his grand-nephew, Dowlut Row Scindia, only thirteen years of age, vast possessions and a well-disciplined army.[1] Mulhar Row, the founder of the Holkar family, was born about the year 1693. He was at first a keeper of sheep, afterwards a commander of horse in the service of the peshwa, and at last one of the great military leaders of the Mahratta confederacy. He died in 1766, at the age of seventy-six years, with the character of a plain and generous soldier. Mulhar Row Holkar had only one son, Kundee Row, who was slain, some years before the battle of Paniput, at the siege of Kumbhere. This prince had married the renowned Ahalya Baee, by whom he had one son and one daughter, both of whom died, the daughter on the funeral pile of her deceased husband. Ahalya Baee succeeded to the sovereignty, and assumed as the commander of her army, and her minister for those duties which a female could not perform, Tukajee Holkar, the chief of the tribe, though not related to Mulhar Row. The administration of Ahalya Baee, who is celebrated by Sir John Malcolm as a shining example of great qualities and amiable virtues, was fraught with blessings to her subjects, the country enjoying under her rule more than thirty years of prosperity and peace. Tukajee Holkar, who reigned till the year 1797, left four sons, Cashee Rao, Mulhar Rao, Eithojee Holkar, and Jeswunt Rao Holkar. The succession was disputed by the two elder brothers, who repaired to Poonah for the decision of the peshwa. The influence of Scindia was at this time paramount at Poonah; and having made his terms with Cashee Rao, he surprised and murdered Mulhar Rao, with all his attendants, at Poonah, in September 1797. The wife of Mulhar Rao left a posthumous child, Khundeh Rao, of whose person Scindia got possession, and retaining Cashee Rao in a state of dependence, proposed to govern the dominions of Holkar in his name. The two brothers, Eithojee and Jeswunt Rao, who were at Poonah at the time of the murder, made their escape, the first to Kolapoor, where he was taken, sent to Poonah, and executed; the latter to Nagpoor, where he was arrested and thrown into confinement. Having made his escape, he fled to Mehysser on the Nerbuddah. Here he collected a band of adventurers, and in October 1801 was enabled to fight a battle with Scindia, in which he was defeated with the loss of his baggage and artillery. Before the middle of 1802 Holkar had assembled a new and well-disciplined army. He insisted on the release of the posthumous child Khundeh Rao, the head, as he proclaimed him, of the house of Holkar; and to enforce his demand, he advanced with his troops from Malwah towards Poonah. Scindia collected his army, and on the 25th of October a battle was fought, in which Holkar obtained a decisive victory.

Foreign policy of Lord Wellesley.

It was during these transactions that the governor-general deemed the occasion favourable for drawing the Mahratta chiefs into a subsidiary alliance with the British; and it was proposed to Scindia that he should receive a British force into his dominions, that he should cede to the Company a territory sufficient to maintain this force, and that he should admit the arbitration of the British in all disputes with the nizam and with the other states of Hindustan; and the governor-general explains, that if he consent to receive a British force within his dominions, "the arbitration of the British government will necessarily be admitted to an extent proportioned to the ascendency which that government will obtain over Scindia under the proposed engagements, and to the power which it will possess of controlling his designs." Was this system, we may ask, of general alliance and subjection to the British, now proposed by the governor-general, a scheme of benevolence for establishing universal peace throughout India, or one of ambition? War is no doubt the great scourge of humanity; and if it could be superseded by the peaceable arbitration of neutral powers, a great blessing would be conferred on mankind. But it is vain to suppose that the potentates of the earth will voluntarily submit to the curb of reason; and vain was it therefore for the governor-general to endeavour, by persuasion or address, to draw the powers of India into an alliance which would reduce them from the rank of independent princes to mere dependents on the British. That the entire ascendency of the Company's government in India would, in preventing intestine war, have been, as it has since proved, highly beneficial to India, no one could doubt; but it was obvious that the supremacy of the British was to be established not by pacific measures but by the sword. The policy, however, of the British government in India was at this time opposed to conquest, and to the influence of this principle must be ascribed the conduct of the governor-general. His motives are entitled to respect, but it is to be regretted that he was not actuated by a less scrupulous spirit. In point of fact, it is by war that all India, happily we sincerely believe for the people, has been at length brought under the control of one ruling power, and that universal peace now reigns over that vast continent. It was not yet time, however, for this desirable consummation; and the Mahratta chiefs, as might have been supposed, received with decided aversion the propositions of the governor-general, which amounted to nothing less than a renunciation of independent power. In the defeat of Scindia, however, by Holkar, and the advance of this latter chief to Poonah, the peshwa saw the overthrow of his power; and he quitted his capital, leaving in the hands of the British resident a preliminary engagement, by which he agreed to receive into his territories six battalions of troops, with their proportion of artillery, and to cede a territory for their support either in Gujerat or the Carnatic, yielding twenty-five lacs of rupees.

---

[1] *Memoir of Central India*, by Sir John Malcolm, vol. i. chap. v.

Treaty of Bassein, and war with the Mahratta chiefs.

This treaty, in which it was further agreed that the peshwa should, by the aid of the British, be restored to his dominions and to his sovereign authority, was formally signed at Bassein on the 31st of December 1802; and immediately Sir Arthur Wellesley, on a report that Poonah was in danger of being burned, advanced on that city by a rapid and unexpected march, with a body of cavalry. At the approach of the British, Holkar's disorderly bands fled with precipitation, and soon abandoned the territory of Poonah; and the deposed prince returned in triumph to his capital, amid the acclamations of the people. The treaty of Bassein, and the entire ascendency of the British at the court of Poonah, excited the jealousy of the other powers; and Scindia and the rajah of Berar now entered into a confederacy for repressing this desire of encroachment on the native states. But their motions were narrowly watched by the British; and their armies having taken hostile positions, from which they refused to withdraw, the British were induced to take the field. A vast force was collected. An army under General Lake assembled on the north-western frontier of Oude, which on the 7th of August marched from Cawnpore, and crossing Scindia's frontier on the 28th, took by assault the fort of Allyghur, and on the 9th of September totally defeated, about six miles from Delhi, the Mahratta force, formerly under Perron, a French officer, and still commanded by one of his countrymen, with the loss of all the artillery and baggage. General Lake entered Delhi, evacuated by the enemy on the 14th, and paid his respects to the Great Mogul Shah Aulum, afflicted with age, infirmities, and poverty, in all respects a touching spectacle of fallen dignity. On the 4th he reached Agra, which was taken by assault after a severe contest; and on the 31st defeated, in the well-fought battle of Laswaree, the remaining force of Scindia; and thus in the course of three months overran all his territories in the region of the Jumna. Nor was General Wellesley, who now gave an early promise of that genius for war which was afterwards more fully displayed in the arduous conflicts of Europe, less successful in the south. His first operation was the assault and capture of the strong fortress of Ahmednuggur on the 12th of August; after which, being apprised that the combined armies of Scindia and the rajah of Berar meditated a march on Hydrabad, he concerted with Colonel Stephenson, who commanded a separate corps, a joint attack on the 24th. In the mean time, apprehensive that the enemy meditated a retreat, he attacked with his own division alone the combined Mahratta armies, encamped on the Kaitra river, near the village of Assye, and obtained the victory after a sanguinary conflict, in which, out of 4500 men, the British lost 428 killed and 1138 wounded, and were entirely disabled from pursuing the enemy. Colonel Stephenson, who joined on the 24th, was sent on this duty, and was also instructed to attack Boorhanpore and Asseerghur, of which, and of all Scindia's territories in the Deccan, he took possession. The British arms were now turned against the rajah of Berar; his army was entirely defeated on the plains of Argaum on the 29th of November. Colonel Stephenson, advancing to Ellichpoor on the 5th of December, laid siege to the strong mountain fortress of Gawilghur, near the source of the Taptee, which was carried by assault. The British were equally successful in every other quarter. The country of Bundelcund was speedily reduced; a force from Bombay attacked Scindia's possessions in Gujerat; and a division of the Madras army the maritime province of Cuttack. The Mahratta chiefs now bethought of peace as their only refuge from impending ruin. A treaty was accordingly concluded with the rajah of Berar, by which he ceded to the Company the province of Cuttack, with the port of Balasore, to their ally the nizam, the country lying between his own frontier and the river Wurda to the eastward, and between his own frontier and the hills, in which are situated the forts of Gawilghur and Nernulla to the northward. By the treaty concluded with Scindia, he ceded in full sovereignty the country between the Jumna and the Ganges, to the northward of the territories belonging to the rajahs of Jeepoor, Joudpoor, and Gohud, the fort and territories of Barooch, of Ahmednuggur, and all the possessions which he held on the south side of the Ajuntee Hills to the Godavery river. Provision was made for the independence of all those minor states in the region of the Jumna which had joined the English in the late war. Of these cessions, it was agreed that the territory situated to the westward of the Wurdah, and to the southward of the hills on which were the forts of Gawilghur and Nernulla, together with the territory between the Ajuntee Hills, should be given to the nizam; that the fortress of Ahmednuggur and its territory should belong to the peshwa, and that the English should have the remaining portion. The minor princes near the Jumna, namely, the rajahs of Bhurtpore, Joudpoor, Jeepoor, Machery, and Boondi, the ranah of Gohud, and Ambajee Rao Englah, now became dependents on the British, by whom they were guaranteed in the possession of their dominions, they defraying any charge which might be incurred. Scindia, now weakened by the loss of territory, was really anxious to secure a subsidiary alliance with the English for the security of his remaining dominions against the designs of Holkar. It was agreed that six thousand infantry, with the usual complement of artillery, should be allotted for his defence; that they should be maintained by the English from the revenues of the ceded territories; and that they should be stationed near the frontier, but not within his dominions. It was further agreed, as formerly in the treaty of Bassein, that the British should not in any case interfere between him and his subjects, but that the subsidiary force, if required, should aid in suppressing rebellion and internal disturbances; a condition of doubtful policy, since it evidently implies that the British were to stand still, the quiet spectators of any cruelties the Mahratta chief might inflict upon his subjects; but, the moment they took up arms in their defence, they were to aid in crushing them, as disturbers of the public peace.

Successes of General Lake and Sir Arthur Wellesley.

Treaty with the Rajah of Berar and with Scindia.

perations gainst Iolkar.

The short period of tranquillity that succeeded the peace with Scindia was speedily interrupted by Holkar, who, though he kept aloof from the confederacy of his countrymen, with an indifference which seemed to argue at once a deficiency of patriotism and a want of sound policy, was, nevertheless, alarmed by the success of the British arms, and his whole conduct evinced his determination to try the fortune of war. His power and resources had gradually been increased, like that of the other chiefs, by the introduction of European officers into his army, and by an improved system of discipline, which he had established. He was, besides, protected by the nature of his country, which is very mountainous, and, during the rains, impassable from jungles and morasses. His skill in maintaining the predatory warfare, so congenial to a Mahratta army, was far superior to that of the other chiefs, whose ruin had so fully taught him the danger of any regular engagement with European troops. Thus, although his territories were invaded on all sides by detachments of the Company's forces, he constantly eluded their attacks; and, by the singular rapidity of his movements, he was enabled suddenly to assemble almost his whole force, and overpower whatever detachments he might find at a distance from support. In this situation, the troops under Colonel Monson were surprised. This officer, in concert with Colonel Murray, who invaded Holkar's dominions from Gujerat, and captured Indore, the capital, without much opposition, had advanced fifty miles beyond the Mokundra Pass, towards the Chumbul, when, alarmed by the fear of his supplies running short, he resolved to retreat. Being betrayed by his guides, and deserted by part of his troops, he was attacked by a superior force under Holkar himself, before which he was forced to retreat towards Agra, through a country impassable from the rains, and destitute of provisions. After several disastrous conflicts, during a retreat of seven weeks, which degenerated into a flight, the greater part of his guns, and the whole of the baggage and military stores, were lost. A few only of the troops reached Agra at midnight, in a state of extreme distress; the greater part had been overtaken in their flight, and were either massacred, or cruelly mutilated, by their ferocious pursuers.

Colonel Willot of the Bengal artillery was almost equally unsuccessful in an attack which he had planned against a strong post in the interior: he failed in the attempt, and soon after died of the wounds he had received. It was in Bundelcund, and the country of the Rohillas, that Holkar received the most considerable checks, which produced a reverse in his fortunes. From both those territories he was completely driven by Lieutenant-colonel Fawcet and General Smith. On the escape of Colonel Monson to Agra, Holkar advanced with his whole army to Muttra, whither he was followed by General Lake, who arrived at Muttra on the 1st of October 1804, Holkar retiring as he advanced. Here he put in practice a stratagem, which had nearly gained for him great advantages. Leaving his cavalry to engage the attention of the British general, he proceeded with his infantry in secret and by forced marches, and on the 8th he appeared before Delhi, on which he opened a heavy cannonade. Next day he erected breaching batteries, and made a determined assault. But this and a subsequent attack was repelled with such determined gallantry by the small garrison under Colonels Ochterlony and Burn, that he desisted from all further attempts, and departed during the night with his whole force.

Parties of his cavalry had been repeatedly defeated by Lord Lake; but the rapidity of their movements as often saved them from destruction, and it was not till the decisive battle of Deeg, on the 13th of November, that the main strength of this enterprising chief was completely broken. At this place his army, trusting to the great strength of its position, behind successive ranges of batteries, was induced to hazard a general action. From these different batteries, which extended to the depth of two miles, they were successively driven by the gallant General Frazer, who had the credit of forcing a post which had been deemed impregnable, and which at this period was defended by twenty-four battalions of infantry and 150 pieces of cannon. In this brilliant achievement the general received a wound in the leg, of which he afterwards died, and was carried off the field. The completion of the victory thus fell to Colonel Monson, who now saw complete vengeance inflicted for his past disasters, and for the unexampled cruelty of his enemy, 2000 of whom were killed, either in the battle or during the retreat. An immense number was wounded, and amongst these many considerable chiefs; whilst eighty-seven pieces of cannon fell into his hands, which partly consisted of the same guns which he had himself lost during his disastrous retreat to Agra. The important fortress of Deeg was besieged and taken at night, by assault, on the 23d of December.

Had Holkar confided merely to his effective force in the field, his cause might have now been regarded as desperate. His boldness, however, and his unexampled success, had gained him the support of several of the native princes. Among these he had seduced the rajah of Bhurtpore, an ally of the British, and the chief of the celebrated caste of the Jauts, the most warlike tribe in upper India. General Lake was therefore obliged to concentrate his army, and to employ it in the reduction of Bhurtpore, a fortress which experience has proved to have been the strongest and most impregnable in the whole peninsula. Whilst thus employed, the dispersed troops of Holkar had time to rendezvous in distant quarters, and were successful in cutting off his supplies of provisions, and in plundering the surrounding districts, by that predatory mode of warfare for which the Mahrattas have always been celebrated. Scindia, also, who had been engaged in continual disputes with the British respecting the treaty which had been concluded, now openly showed his hostile dispositions by invading the territories of the British allies, by attacking and plundering the camp of the British resident, and by his ill-concealed correspondence with Holkar, whom he now openly joined.

Siege of Bhurtpore.

The reduction of Bhurtpore, defended by the indefatigable efforts of Holkar, by its intrepid garrison, and its own natural strength, proved the most arduous enterprise which the British troops had ever undertaken in Asia. The success of the besieged in repelling four different assaults animated them with fresh courage and intrepidity. The rajah and his whole tribe were united by the ties of blood, as well as of civil authority. They laid claim to a high caste among the natives, which they knew must be forfeited for ever by unconditional submission. Unfortunately these were the only terms which General Lake, in the peremptory instructions which were given for its reduction, was permitted to accept. The rajah, therefore, having collected in the fort his women, his children, and his treasures, resolved to bury them all with himself under its ruins, rather than submit to terms which were deemed as disgraceful to his religion and his rank, as they were mortifying to his feelings as a soldier. Compelled by the orders of his superior, and undaunted by all the past disasters which the troops had already suffered, General Lake resolved to hazard another attempt, which was equally unsuccessful with all the others. In the official account given of this last attack, it is said, "the bastion, which was the point of attack, was extremely steep, the resistance opposed to them was vigorous, and as our men could only mount by small parties at a time, the advantages were very great on the side of the enemy. Discharges of grape, logs of wood, and pots filled with combustible materials, immediately knocked down those who were ascending; and the whole party, after having engaged in an obstinate contest for two hours, and suffering very severe loss, was obliged to relinquish the attempt, and to retire to our trenches." The loss of the British army in this last assault, and that of the 20th, amounted to 300 killed, and 1564 wounded; its whole loss, during the different attacks, amounted to upwards of 3000 of the bravest of our troops, whilst the unconditional surrender of the place, though the ultimate object of all these perilous attempts, was never attained. The rajah, however, again proposed the terms he had formerly offered, and consented to pay three lacs of rupees to the army, and the expenses of the war. Hostages were given for the regular discharge of these sums, at different instalments. Thus the last prince in India who resisted the British arms was found to have made the most glorious defence of his independence, and to have secured for himself the most honourable terms. Holkar, unable any longer to face the British troops, was reduced to the condition of a fugitive; and flying from place to place, often beaten, and at last deserted by almost the whole of his troops, was obliged to escape with a retinue so scanty as was hardly sufficient for the protection of his person.

Arrival of Lord Cornwallis. Pacific policy.

The directors of the Company in Europe, though they were dazzled for a time by the splendid successes of the British arms, were at length startled by the warlike policy and prodigal expenditure of the Wellesley administration; and, with a view to retrieve their embarrassed affairs, the Marquis Cornwallis was sent out as governor-general to Calcutta, where he arrived on the 30th of July 1805. He entirely disapproved of the system of subsidiary alliances adopted by his predecessor, by which the British were entangled in the labyrinth of Indian politics. He censured in strong terms the treaty of Bassein, which reduced the British, as he states, to "the alternative of mixing in all the disorders and contentions incident to the loose and inefficient constitution of the peshwa's administration, or of suffering the government and dominion of his highness to be completely overthrown by the unrestrained effects of general anarchy and rebellion. Under such circumstances," he adds, "the alliance with the peshwa, far from being productive of any advantage to the Company, must involve us in inextricable difficulty, and become an intolerable burden to us." In pursuance of these views, he resolved, as soon as Scindia should release the British residency, to conclude a treaty with him, and to restore to him Gualior and Gohud, the points in dispute. At this critical period Lord Cornwallis, languishing under age and infirmities, expired. But his successor, Sir George Barlow, entered entirely into his views. A treaty was concluded with Scindia on the terms proposed; the British agreed to renounce all interference, by treaties or otherwise, with the rajahs of Odeypoor, Joudpoor, Kotah, and other chiefs, the tributaries of Scindia, in Malwah and Mewar. A treaty was concluded with Holkar, on the 24th of December 1805, by which all his former territories were restored to him, both on the north and on the south of the Chumbul. According to his system, Lord Cornwallis dissolved all the alliances which had been formed with the petty princes of India, several of whom had aided the British in the late contest. Lord Lake earnestly remonstrated in vain against this abandonment of the British allies, several of whom were now left, contrary to the faith of protecting treaties, to the vengeance of the Mahratta chiefs, Holkar and Scindia.

General peace.

Nepaulese war.

From the year 1805, when a general peace was established by Lord Cornwallis, to the year 1813, when Marquis Hastings assumed the government, the political relations of the Company with the native powers had undergone little alteration. The tranquillity which prevailed was, however, more apparent than real; and it was naturally to be supposed, indeed, that the widely extending domination of a foreign power would excite the jealousy of the native princes of India. Such of them, accordingly, as retained any sense of national honour were naturally hostile to the British, and were well disposed to unite against them as the common enemies of Indian independence. In 1814 the war with the Nepaulese commenced, and in the outset the reverses sustained by the British in their attempts to penetrate into the hill country strongly excited the hopes of the native princes. In the following year, the valour and military talents of Sir D. Ochterlony brought that war to a brilliant close; and the bravery and discipline displayed by the troops in the course of the campaign renewed among the Indian princes the former impression of their invincible superiority. Whatever might be their ulterior views, therefore, they were compelled for the present to temporize, and to soothe their conquerors by an outward show of humility and peace.

Incursions of the Pindarees.

A more favourable opportunity, as they conceived, soon occurred for successful resistance to the British power. From the constant wars and commotions in which India had from time immemorial been involved, it happened that a great proportion of the native population were trained to habits of disorder and military license. At the general settlement concluded in 1805, it was naturally supposed that those bands of adventurers, having no longer any scope for their predatory enterprises, would betake themselves to pacific pursuits, and would thus be gradually dissolved among the mass of the people. It happened otherwise. Those hordes of freebooters, known under the general denomination of Pindarees, improved both in strength and union, and Scindia and Holkar, in whose neighbourhood they were settled, if they did not openly abet them, made no active efforts for their suppression. The nature of their force may be shortly described. It consists of a species of light cavalry, which was formerly attached to the native armies, in the same manner and for the same purpose as the Cossacks are to the armies of Russia. Their horses were trained to long marches and hard fare, it being their object to plunder the country, and to elude pursuit by the celerity of their movements. They were generally armed with a bamboo spear, from twelve to eighteen feet long; every fifteenth man carried a matchlock; about four hundred out of every thousand were well mounted; of the remaining six hundred, four hundred were indifferently mounted, and the rest were slaves, attendants, and camp-followers, mounted on wild ponies, and keeping up with the corps as they best could. About the year 1814, these predatory bands comprised about 40,000 horse, who followed plunder as their mode of subsistence, and were indeed a most formidable species of gang-robbers; but, like other robbers and murderers on a great scale, they assumed all the form and pomp of military array. The strength and numbers of this disorderly mass were daily increasing by deserters from Holkar's irregular bands, and from the loose cavalry establishments of Scindia and others, where they were retained by no tie but that of present advantage, and where their pay was always in arrear. The central situation of the Pindarees, at an equal distance from the three presidencies, rendered their hostility still more formidable, and enforced on the British the necessity of maintaining an extensive line of defence, which was always penetrated by those flying hordes, and the territories of our allies exposed, in consequence, to annual devastations. In 1808–1809, and in 1812, they carried their incursions into the British territories, and returned loaded with spoil. The fame of these successful exploits recruited their bands, and enabled them to extend their ravages. In October 1815, a force of 8000 Pindarees crossed the Nerbuddah in a north-west direction, and dividing into two parties, they penetrated to the Kistnah, though they were watched, and one party was surprised by a body of infantry and cavalry, which did them, however, little damage. They were only deterred from crossing into the Madras presidency by the swollen state of the river, along the fertile and populous banks of which they took their course, plundering as they went along, and committing every kind of enormity. In their return along the line of the Godavery and the Wurda, they passed the British positions, making good their retreat with an immense booty, and with utter impunity. A second expedition was soon planned, which, crossing the Nerbuddah, appeared on the western frontier of the district of Masulipatam, under the Madras presidency, on the 10th of March 1816. Next day they made a march of thirty-eight miles southward, plundering ninety-two villages, with every circumstance of unheard-of cruelty; and on the 12th they marched thirty-eight miles, plundering fifty-four villages. By the 17th May they had nearly all recrossed the Nerbuddah, loaded with spoil, and with scarcely any loss. During the twelve days that they had remained within the Company's territories, it was ascertained that 182 persons had been put to a cruel death, 505 were found severely wounded, and 3603 had been put to different kinds of torture.[1]

War with the Pindarees.

It now became necessary to adopt efficient means for protecting the country against these destructive visitations. For this purpose a defensive line of posts was extended along the Nerbuddah, and across the country for about 150 miles. This was, as usual, soon penetrated by the activity of the enemy, and various expeditions advanced southward for the purpose of plunder. By the singular activity of the different corps, and by a train also of fortunate accidents, almost all of these expeditions were intercepted, broken, and discomfited, so that very few of the plunderers made good their retreat. It was resolved, however, in the year 1817, to commence offensive operations; to attack the enemy in their native haunts, and either to exterminate them, or to drive them from the advantageous position which they occupied, in the very centre of India. The season of inaction was accordingly spent in making preparations for a great military effort; and, by the end of the rainy season of 1817, a numerous and well-appointed army was ready for the field. The plan of the campaign was, that the armies of the different presidencies should advance northward, and gradually converging to a common centre, hem in on every side, the devoted territory of the freebooters.

War with the Peshwa.

But whilst this plan was in progress, it was interrupted, and part of the troops engaged in executing it were suddenly recalled, by the unexpected hostility of the native powers. Bajee Rao, the peshwa or prince of Poonah, who had long been impatient of the British yoke, availed himself of this opportunity to make a fresh attempt to recover his independence. With a view of more vigorously prosecuting the war against the Pindarees, all the troops had moved northward, with the exception of a brigade which had been left at Poonah; and it was to overpower this small body of troops that the peshwa's first efforts were directed. They were completely unsuccessful; he was repulsed at all points by the steadiness of the Company's troops. This action took place on the 5th of November. On the 13th, the British were joined by General Smith's division, which had advanced on the Godavery, on an understanding, that if he did not hear daily from the resident at Poonah, he should countermarch to that place. It was resolved to attack the enemy's camp next day; but it was found deserted. General Smith immediately commenced an unremitting pursuit of the peshwa, who was hunted from place to place by the different corps of the British army, until he at length deemed it prudent to surrender. He was deposed from his throne; a residence in a particular city was fixed upon for him; and a pension of about L.100,000 per annum assigned him for his support. His dominions were of course taken under the administration of the British.

War with the Rajah of Nagpoor.

The rajah of Nagpoor, Appa Saheb, who was held in the same thraldom by the British, pursued a similar course, and with the same results. On the 26th of November, at sunset, he attacked, with a great superiority of force, the brigade left at the residency, which was in consequence in great peril. A doubtful contest was maintained through the night, and next day the attack on the British was renewed with fresh vigour. Under every disadvantage those attacks were finally repulsed, and the weak prince, Appa Saheb, taking fright, sent to ask forgiveness from his enemies. The conditions offered him were, that his territories should be placed at the mercy of the British government; that he should give up all his artillery, disband his troops, and come in person as a hostage into the British camp; on an understanding that if he acceded to these terms, the former relations between him and the British would be restored; it being at the same time understood that he should cede part of his territory, and that due provision should be made for a greater degree of internal control over his future movements. Being threatened with an immediate attack, he came to the British camp with a few attendants. His troops, as if to shame their pusillanimous prince, fought an unsuccessful battle for his rights and independence; after which the city of Nagpoor, with its fort, was surrendered to the conquerors, and this second war was brought to a triumphant close. Appa Saheb, afterwards repenting of his spiritless conduct, began to plot new schemes, when he was arrested by the British resident, and detained in close confinement. He found means to escape in the summer of the following year, and making good his retreat to the hills, where he was joined by a band of irregular followers, he distracted the country for a time by desultory hostilities. Having thus fled from his dominions, the conquerors determined to invest Bajee Rao, a grandson of Raghojee Bhoonsla, with the sovereignty, and to take the internal administration wholly under their own control. It had been the professed intention of the Anglo-Indian government, which had now become the conservator of the general peace, to force the two independent chiefs, Scindia and Holkar, into an acquiescence with its views in regard to the Pindarees, and also the Patans, a species of infantry, better appointed, and more regularly disciplined, than the Pindarees, but associated together on the same unlawful principle of indiscriminate plunder. Scindia had been compelled to temporize, and finally to accede to the British propositions. The court and administration of Holkar were distracted by contending factions. The late prince, after the unfortunate issue of his war with the British, became deranged, and soon afterwards died. His heir, Mulhar Rao, was at the time under age; and Toolsye Bhye, the widow of Holkar, and now appointed regent, contended for supremacy with the Patan chiefs. Their views were entirely discordant, the queen-regent soliciting an alliance with the English, on condition of receiving a subsidiary force; a measure so strongly opposed by the military chiefs and the troops, that they conspired against Toolsye Bhye, and having seized her person, carried her to the banks of the river, where she was put to death. After this outrage, they prepared for war, and troops were concentrated in such hostile positions, that Sir John Malcolm judged it expedient to fall back. Having effected a junction with the corps under Sir J. Hislop, they attacked, on the 21st of December 1817, the army of Holkar, encamped at

---

[1] *Narrative of the Political and Military Transactions of British India under the Administration of the Marquis of Hastings.* By Henry T. Prinsep, chap. i. and v.

Mehedpoor, and advancing to close action under a severe fire of artillery, the enemy's troops gave way at all points, and the camp, artillery, and baggage, fell into the hands of the victors. Peace was sought and obtained by the Patan chiefs, who ruled in the councils of Holkar; they accepted the protection and alliance of the British; and thus they enrolled themselves amongst the dependents and tributaries of the new sovereigns of India.

The main object of the war, which was the destruction of the Pindarees, was not, in any material degree, impeded by these incidental contests. According to the plan proposed, the different divisions of the grand army proceeded northward, converging as they advanced for the purpose of surrounding the haunts of these freebooters, and preventing their escape. They were driven out of the province of Malwah, retiring as the British advanced; but were at length so effectually hemmed in, that in attempting to retreat they were intercepted at all points, and the greater part of them destroyed. The remainder were so humbled by fatigue and misery, that they were glad to submit upon any terms; and at length the three principal leaders surrendered on condition that their lives should be spared.

Settlement of the country.

All open resistance being thus successfully put down, the more important task still remained of quieting and conciliating the country, overrun by lawless hordes of troops or banditti. The history of Hindustan is, from its earliest period, one unvarying scene of intestine violence, of war, rapine, rebellion, and bloodshed. For twenty years prior to the Pindaree war, these disorders had been increasing; and to still this intestine storm, to overawe the turbulent, and to settle on a permanent and equitable basis the conflicting claims to dignity, power, and property, which had arisen in a long period of trouble, when might was the test of right, was a task that required unusual prudence, firmness, and patience. This difficult and all-important duty now devolved on Sir John Malcolm, who to his glory as a warrior now added the still greater glory of a legislator and a statesman. Whilst he distributed his troops in such positions throughout the disturbed districts, as entirely to overawe the fiercer mercenaries and turbulent Arab soldiers, he conciliated the peaceable inhabitants by mildness, moderation, and justice. To all ranks, to the head of a village as well as to the sovereign of a kingdom, to the leader of a gang of robbers as well as to the commander of an army, he explained that his sole object was to establish the peace of the country. By kindness and conciliation he succeeded in reclaiming the Grassia, Rajpoot, and Bheel freebooters, and the discharged Patan mercenaries, accustomed to prey on the country. Persecuted and oppressed as outcasts and robbers, they were won by the generous confidence of Sir John Malcolm, who offered them pay in the British service, and employed the most notorious of the Bheels to guard his person and treasure, in which they proved invariably faithful. Thus the disorderly bands amongst the Pindarees and Patan soldiery, for many years the disturbers of India, were gradually converted into its industrious cultivators; and a great and happy change was effected in the habits of the people and in the aspect of the country. The several princes and rajahs of Central India were enriched by increased revenues and diminished expense. The troops maintained by Scindia were reduced from 39,000 to 22,000; and those maintained by the rebellious chiefs and tributaries, always ruinous to the country, were disbanded. His revenues were increased twenty-five per cent., and the expenses of collection reduced fifteen per cent. The revenues of Holkar were increased from four lacs in 1817, to sixteen lacs in 1819–1820. The condition of all the other inferior rulers and feudatories was improved in the same degree. "In 1817," says Sir John Malcolm, in his admirable work on Central India, "there was not one district belonging to Scindia that was not more or less disturbed; in 1821 there existed not one enemy to the public peace."

Petty states of India.

After the contest was brought to a close, the country was still overspread with disorderly bands of Arabs, Mekranies (from Meckran in Persia), Mewassies, and Patans; and the general result of the arrangements now adopted was the expulsion of these disturbers of the country, and the restoration of the just rights and dignities of Scindia and Holkar, as well as of a crowd of petty feudatories and renters, who were before the prey of freebooters. The same system was extended to the Rajpoot states to the N. W. of Malwah and the Chumbul River. The petty rajahs who occupied this country were continually at war; and the country was besides laid waste by the predatory bands of Ameer Khan, Holkar, and Scindia, who, on pretence of espousing the quarrels, invaded and plundered the territories of the different chiefs. These evils had risen to such a height, that they were all desirous of being admitted into a federal union with the British government, offering in some cases half their dominions for protection. In 1818 they were admitted into this union, of which the British are at the head. They agreed, in the event of any future differences amongst them, instead of appealing to arms, to submit their differences to the arbitration of the British government. In this manner their country, freed from the scourge of internal war, has progressively improved. The military adventurers who fled before the victorious armies of Britain, were reduced to submission by the wise and conciliatory measures of Sir D. Ochterlony, combined with skilful military movements. The Patan battalions, with about 3000 horse, were taken into the British service, the officers being dismissed with pensions. These measures have been followed by the happiest effects. The wretched peasantry have emerged from their hills and fastnesses, the usual refuges of the oppressed, and have occupied their deserted villages; the ploughshare is again at work on a soil undisturbed for years, except by the hoofs of predatory horse; and although the fierce habits of war may occasionally recur, yet the foundation of improvement is laid. The daring robber, moulded by time and the force of circumstances, will gradually exchange his wild and disorderly habits for those of the peaceful cultivator, and commerce and industry succeed to scenes of desolation and war.

The tranquillity which succeeded these events was but of brief duration. The rajah of Bhurtpore, confiding in the strength of his fortress, committed several enormities in his government, such as the seizure of the infant rajah, and the murder of his uncle and followers; and he even treated the remonstrances of Lord Amherst with indifference and contempt. In these circumstances, the reduction of this formidable stronghold was essential to the glory of the British arms, on which former failures had left a stain. The siege was accordingly commenced with 25,000 efficient troops; and as no impression could be made by cannon on walls of clay sixty feet in thickness, they were thrown down by the explosion of a mine. The assault took place next day, the 17th January 1826, which was completely successful, with the loss of 163 killed, and 466 wounded. The principal works of the fortress have since been demolished.

Burmese war.

The British rulers of India and the Burmese monarch had long been involved in mutual disputes, and these were brought to an issue in 1822, by a claim set up by the sovereign of the Burmese to the petty isle of Shapuree, in the province of Bengal, on the Chittagong frontier, and by aggressions on the British territory, which were repelled by a force stationed at Chittagong, whilst a large armament was sent to Rangoon, the naval arsenal of the Burmese empire, which was captured; and, after a series of hard-fought actions by the British, who endured much privation and distress, the monarch of Ava was compelled, in 1826, to sue for peace, by the near approach of the army to his capital.[1] Thus terminated the first Burmese war. After the lapse of several years it was followed by a second, rendered necessary by the wrongs, public and private, inflicted by the Burmese government. It was neither long in duration nor brilliant in events, and concluded with the annexation in December 1852 of the extensive province of Pegu, in satisfaction to some degree of the injuries sustained, and in aid of the means of defending British territory and property from further aggression.

The Affghan war, commenced in 1839, with a view to raising a barrier against the aggressive power of Russia, brought to the British no accession of territory, of power, or, taken on the whole, of glory. It was ostensibly undertaken to restore to the throne a former Affghan ruler, Shah Shoojah, supposed at least to be actuated by friendly feelings towards the British, though doubts on that point may well be entertained. The advance of the forces destined for the conquest of Affghanistan was attended by much difficulty and dreadful suffering; but at length a part of the invading army reached the chief city Cabool. Here it was thought the object of the expedition was gained; but the commencement of a new and frightful series of calamities was at hand. Insurrection broke out; the British envoy was treacherously murdered; a large part of the British force was destroyed, and the remainder compelled to retire under the most disastrous circumstances—incessant annoyance and fearful slaughter marking its progress. Many deeds of heroism, never surpassed, tended indeed to add fresh lustre to the British name, and among others the noble defence of Jelalabad by Sir Robert Sale can never be forgotten so long as Affghanistan is remembered. But the war and its consequences contribute to furnish an awful page in the history of British enterprise in India. Ultimately the country was avenged, and its reputation vindicated through the vigorous counsels and the vigorous acts of Generals Pollock and Nott. The former arrived first at Cabool, and replanted the British colours there; the latter arrived shortly afterwards. The British could now withdraw without discredit from a country where, for the first time, the *prestige* of their national character seemed endangered. That at least was vindicated and upheld, though, looking at the expenditure of blood and treasure, at the mass of suffering, and the imminent danger of irreparable disgrace which must have followed a premature retirement, every Englishman must wish that the war had never been undertaken.

The country of Lahore, or the Punjab, as far as the Suliman Mountains, was occupied by the rajah Runjeet Singh, who in the year 1805, when Lord Lake had an interview with him, seemed to be one among many petty chiefs. Between this and the year 1812 he subdued the whole country, but while proceeding in 1808 to extend his power over all the petty chiefs as far as the Jumna, he was opposed by a strong military detachment of British troops stationed at Loodiana. A treaty was concluded in 1809, by which it was mutually agreed that the rajah should not encroach on the territory to the S. of the Sutledge, nor the British on the territory to the N. of that river. The death of Runjeet Singh gave rise to a series of excesses terminating in a state of things in which the army was triumphant over the government, and was an object of its dread rather than of its dependence. At length a portion of it crossed the Sutledge, and invaded the British territories. This, of course, was repelled; and, first at Moodkee, subsequently at Ferozeshah, in December 1845, the Sikhs were defeated. At Aliwal and at Sobraon fresh triumphs attended the British forces, who finally crossed the river and dictated the terms of submission at Lahore, the Sikh capital. Here a treaty was concluded under which the British obtained a cession of all the territory between the Beas and the Sutledge; the native government of Lahore being retained with some requisite modifications. But this arrangement proved of short duration. The atrocious conduct of a chief holding the fortress of Mooltan, where two British officers were murdered; the generally distracted state of the country; the open violation by the government and people of the treaty so recently concluded; and the actual levying of war against their peaceful neighbour, demanded further intervention of a hostile character. One step only remained to be taken, and the success which again attended the British enabled the governor-general to take it. The Punjab was annexed, and was thenceforward a part of the vast empire of India.

Various attempts had at different times been made to establish friendly relations with the ameers or rulers of Sinde, but they had been met reluctantly and unfavourably. Two or three treaties had been entered into; but they were brief, dry, and to neither party satisfactory. The ameers of Sinde hated the alliance which the British were anxious to establish, at first for commercial, latterly for political purposes. When the British commenced the march to Affghanistan, a treaty was forced upon the rulers of Sinde, which was more distasteful than any former one. Under this treaty, a British military force was to be permanently stationed in Sinde; and after some considerable time, Sir Charles Napier, whose career in Sinde has given rise to such a mass of controversy, was appointed to the chief command there. He commenced his course certainly with vigour, but as certainly with little consideration of the existing rulers. Treaties were proposed which, though rejection must have been looked for, were accepted, whether with sincerity or not;—probably there was little of that quality on either side. But, notwithstanding the acceptance of the treaties, Sir Charles Napier continued to advance. During his progress the British residency was attacked. It was gallantly defended, but weakness of numbers, and deficiency of ammunition, soon rendered retreat necessary. This was effected in good order, but at the sacrifice of the greater part of the property within the residency. The battle of Meeanee followed, in which the British gained a brilliant victory. Another battle, fought near Hyderabad, the capital, may be said to have terminated the contest; and Sinde in 1843 became a British possession.

The conclusion of the contest in Sinde found the British government involved in difficulties in Gwalior, or the dominions of Scindia. The death of the representative of that house without heirs rendered an arrangement for the appointment of a successor necessary. A child said to be the nearest relative of the deceased prince was selected, and the British government approved. But every Indian court is a focus of intrigue, and that of Gwalior formed no exception. A rabble army of 30,000 men was a source of weakness, not of strength; and through the influence of a profligate and reckless court, combined by that of a disorganized army, the state appeared rapidly tending to dissolution. Internal war had in fact commenced, when the British government, somewhat tardily, though at the last rather hastily, put in motion a military force towards the disturbed country. It soon came into hostile collision with the enemy; and two victories in one day, gained by two separate portions of the British force, decided the questions at issue. A new treaty followed, dated January 1844, in which a variety of arrangements for the safety of Scindia's territories, and the security of those adjacent, were embodied.

Political system of India.
